This still leaves Grotius open to the objection that he places no limit on the power of human law to suspend justice. Human law cannot command anything against the law of nature, but is there anything it cannot permit? Grotius does not seem anywhere to identify such a limit. Thus Rousseau's charge that he is a mere apologist for tyrants. Thus also does Kant charge that Grotius's "law" provides no meaningful restraint on the behavior of states and can be enlisted by any conqueror who cares to have such justification.¹⁷ Kant does go on to say that the desire of nations to seek such moral cover itself reveals an impulse that promises eventual progress toward greater morality in state behavior. The hope for such progress is something Kant and Grotius share. Grotius is of the belief that throwing up a utopian ideal for international behavior, as pacifism or pure just-war doctrine do, is not the way to gain such progress. He believes we must grant the law of nations legitimacy as a genuine form of law, despite its moral flaws. We may, we must, point out those flaws and hold up to the nations a higher moral standard rooted in natural law and the virtues. But until the community of nations comes around to such a standard, we must realize that the law of nations is the only effective system of norms we have in international politics. Its imperfections are the price we pay to obtain something like the rule of law on this difficult terrain (cf. Lauterpacht 1985, 28). This is not an inconsiderable good. We allow law to bend before the necessities of international politics and war, that it might not break. Grotius's intellectual schema of mixed natural and human law is devised to allow for such flexibility.

It is precisely this flexibility which, while at present sanctioning crime, also allows for future progress. This, from Grotius's point of view, might be the greatest advantage of conceiving the relation of natural and human law the way he does. It allows him to countenance the moral permissiveness of international law without abandoning or compromising the superior standard of natural law. This, in turn, allows him to be the strong advocate of moral progress in international affairs that he is. The *temperamenta* that occupy the last 150 pages of his book testify to Grotius's hope that the moral law—natural law as well as the more stringent requirements of virtue and the Gospel—can exert influence on the behavior of states for the better. This influence can be increased if morality is championed by prudent spokesmen such as Grotius, whose exhortations make the necessary concessions to practical reality. Grotius speaks approvingly of progress that the European nations of his day have made in renouncing the enslavement of war captives (III.7.9, 696). Many of the developments of international law since his day would likewise be applauded by him, such as the acceptance of noncombatant immunity and the desuetude of the law of prize.

Grotius might say, with Kant, that the moral force of

the natural law has inspired and directed this progress, whether or not his own exhortations contributed significantly to it. But he would also say that state behavior still has not come up to the level of natural justice, and that it remains important to give standing to international legal norms despite their imperfections. For we must realize that some of these imperfections will never be overcome. Some undoubtedly *should* never be overcome, inasmuch as unleashing the pure principles of justice in war and international politics might lead to more intractable conflict. Even in the concluding section of the *Law of War and Peace*, Grotius does not suggest that we will ever be able to overcome the necessity to grant belligerent rights to all legal combatants, just or unjust. Yet, this is the foundational breach of justice in the law of war. Twentieth-century thinking about war may have moved strongly toward differentiating aggressors and defenders, just and unjust, but it still has not been able to dispense with this basic principle within the law of war itself. Grotius's approach to the problem of morality in international affairs bows to this necessity and others. It allows us, and encourages us, to make moral progress where progress is possible, but it provides for the rule of law even where necessity is too strong to be overcome by the gentle promptings of justice.

The Political Determinants of International Trade: The Major Powers, 1907–90

We test three arguments about the effect of international politics on trade flows. The first argument states that trade flows are greater between states with similar interests than those with dissimilar interests, the second that trade flows are greater in democratic dyads than nondemocratic dyads, and the third that trade flows are greater between allies. We examine trade flows between the major powers from 1907 to 1990. This period provides variation on all three independent variables of interest and allows us to separate the three arguments empirically. We estimate a gravity model of trade with the above political variables added. Our results demonstrate that joint democracy and common interests increase trade in a dyad, but alliances generally do not, even when controlling for polarity of the system.

Politics shapes international trade. We evaluate and elaborate three broad arguments that seek to explain how international politics shapes trade between states. These arguments explicitly assume that political factors have observable effects on international trade flows. This is so since governments in free market economies still set the rules under which firms import and export, while governments in managed economies directly negotiate the terms of trade.

Although all three arguments relate trade to politics, their foundations are different. Two of the arguments address the differing responses of economic actors to politics. The first is that conflict and the anticipation of conflict reduce trade flows between states, because economic actors respond to the risk conflict adds to a trading enterprise (Pollins 1989a, 1989b). The second argument is that pairs of democratic states will trade more than other pairs of states (Dixon and Moon 1993). Limited government assures economic actors that their positions will be protected from government fiat, and democracies and limited government have gone hand-in-hand historically. The third argument centers on the direct effect of politics on trade. According to this argument a state will be reluctant to trade with another state that may use its added wealth to increase its military capability against it. Furthermore, this effect is argued to be stronger in a bipolar system than in a multipolar system (Gowa 1994; Gowa and Mansfield 1993).

We acknowledge with gratitude the support of this research by the University of California's Center for German and European Studies and Institute on Global Conflict and Cooperation. We thank Neal Beck for his answers to our methodological questions, Edward Mansfield for making his data available to us for comparison with our data, Scott Bennett for his help in establishing the reliability of some of our data, Michael Lewis-Beck for his comments on an earlier draft of this article, and the members of the Politics and Organization Seminar at Stanford University for their discussion of an earlier version.

We test these three arguments simultaneously in this article. Separate tests could be misleading because the different factors driving each scenario often occur together in the historical record. In particular, democracies have tended to have close relations and formed alliances with one another (Siverson and Emmons 1991). A test of one of these arguments that does not control for the other two may produce spurious results. Our analysis assesses the political determinants of trade flows among the major powers during most of the twentieth century. Those powers encompass dyads with good and poor relations, democracies and nondemocracies, and alliances in both bipolar and multipolar systems. This set of states offers variance on the three candidate explanations for the political determinants of trade. The data provide annual observations on trade flows between all directed dyads of major powers between 1907 and 1990, except during the two world wars and the year immediately following the end of each.¹

Briefly, our results indicate that close political relations increase trade in a dyad; a militarized dispute does not significantly reduce trade between the disputants; democratic dyads trade more than other types of dyads; and an alliance appears to reduce trade between its members, which was especially the case after World War II.

The first two results address the argument on political conflict and trade, the third the argument on regime types and trade, and the fourth the argument about security concerns and trade. These results hold even when controlling for the other arguments, the distance between trading states, and the size of their population and economy.

This research has important implications for the broadest theoretical arguments in international politics. Realists contend that the demands of state survival in the international system mean that domestic political systems are irrelevant to international politics. In

¹ By directed dyads we indicate that each case reports state *i*'s exports to state *j* in a given year. Our data begin in 1907 because the availability for all series before that date is irregular.

the realist view, states must be concerned with the distribution of the benefits of trade because economic strength can be converted to a military advantage. Our evidence challenges this view, a theme to which we return in the conclusion.

We begin with summaries of the three arguments and the existing evidence. Next, we specify our testable hypotheses from these summaries. We then describe our sample of the great powers, their trade flows, their economic characteristics that we use as control variables, and the relevant political characteristics. Because the data are a cross-section of time series, we explain our estimation strategy. The results are presented, and we conclude with an evaluation of the three arguments and a discussion of directions for further research.

HOW DOES POLITICS AFFECT TRADE?

In this section we review the arguments about how politics can affect trade, and from these we develop the set of hypotheses to be tested. The first argument is that the political relations of states affect their levels of trade. The second asserts that democratic dyads trade more than other pairs of states. The final broad argument is that alliances between states affect trade, but the strength of the relationship is contingent upon the polarity of the international system.

The State of Political Relations

Political relations between states can directly and indirectly influence their trade. When political conflict arises between two states, if one of them enjoys a position of economic strength over the other, then it may consider restricting trade to advance its side of the conflict (Hufbauer, Schott, and Elliott 1990). Short of war, interstate conflict can lead to embargoes in the place of overt military violence; for example, it is illegal to bring a Cuban cigar into the United States. This is a direct effect; political conflict leads to government policy to restrict trade.

Conflict also can have an indirect effect on trade flows, since individual economic agents assess the possibility of political disruptions of their business when they consider establishing and continuing a trading enterprise. Such disruptions create a political risk for actors in trade. The more likely the conflict, the more profitable the trade must be to compensate for the risk of disruption. Consequently, political risk rises with both the likelihood and probable intensity of conflict; war produces the greatest disruption of trade, even though it is the least likely form of conflict. In peacetime, the anticipation of conflict determines the risk premium that trade enterprises face. If agents believe that conflict is likely, then only the most profitable businesses engaged in trade can justify the added political risk. All else equal, pairs of states with good political relations should have more trade than states with poor political relations. They are less likely to be in conflict in the future, and so the political risk to trade is relatively small. This effect of conflict is

indirect; the threat of future government action to restrict trade leads to less international trade.

Drawing his theoretical position from a model based upon the choices of individual economic agents, Pollins (1989a) presents clear evidence that political relations affect trade flows. He begins with an economic model that analyzes how prices affect trade flows between pairs of states and then adds a measure of the amity/hostility between those states based on the annual summaries of the Conflict and Peace Data Bank (COPDAB) data (Azar 1980). Drawing data from the yearly exports of twenty-five states to six carefully chosen importer states in the period 1955–78, he found that imports increased as political relations improved after controlling for price differences.² In a parallel study, using a slightly different research design based on a gravity model of international trade (which we discuss below), Pollins (1989b) obtained similar results.

While Pollins joins together both the direct and indirect effects of conflict on trade, we wish to test them separately in order to assess the sensitivity of trade to their individual effects. Our first hypothesis addresses the *direct effect* of conflict on trade:

HYPOTHESIS 1a: *States in conflict with each other will have lower levels of trade than states not in conflict.*

In particular, we will examine how militarized interstate disputes affect trade flows between the disputants. Such disputes are public political conflicts of the highest magnitude short of war; if disputes do not reduce trade flows, then it is unlikely that any conflict short of war has a direct effect on trade.

Pollins (1989b, 739) recognizes the possibility of indirect effects of conflict on trade, but he does not explicitly test for them. Dixon and Moon (1993), however, report evidence of these indirect effects. Their results indicate that states whose interests are closest to those of the United States, as measured by similarity of voting in the United Nations, have higher levels of trade with the United States than other states.

Our second hypothesis completes this picture by addressing the *indirect effect* of conflict on trade flows.

HYPOTHESIS 1b: *The greater the degree of common interests between a pair of states, the greater will be their trade flows.*

It is important to note that this hypothesis assumes that common interests are an indicator of less conflict in the future. Divergent interests reduce trade indirectly by increasing the risk premium to firms engaged in international trade.

Joint Democracy

Internal political factors may also affect trade flows. Dixon and Moon (1993) argue that pairs of states with

² The combined exports of the twenty-five states in the data used by Pollins is approximately 67% of the world total. The six importers are the United States, the Federal Republic of Germany, the Soviet Union, the German Democratic Republic, Egypt, and India. These states are also included among the exporters.

similar political systems should have more trade than those with dissimilar systems. Nations may manage their trade policy to direct trade flows toward nations with similar systems. Added trade could enhance the political stability of their trading partners or reward them for their prior cooperative actions. Barriers to trade, then, are likely to be lower between states with similar systems than between states with dissimilar systems. Moreover, states with limited government should be particularly conducive to developing trading relations, since these systems have open politics and judicial systems (North 1990). Firms considering foreign trade must assess the political risk posed by the domestic institutions of the countries in which they deal. Confiscation of assets by a foreign government is one such risk; the chance that a foreign firm's position will not be taken seriously in a legal dispute with domestic actors is another. These risks reduce the expected profitability of businesses in international trade and reduce overall trade flows because businesses with marginal profitability drop out of the market. Of course, exceptionally profitable trade will still be pursued in the face of this political risk; at the margin, however, limited government in democratic systems encourages trade by reducing the political risk of arbitrary treatment by the host government. Limited government based on the rule of law gives foreign firms greater confidence that their interests will not be handled arbitrarily. Foreign firms then should be more willing to operate in economies overseen by limited governments.

In the period we examine, democracies typically have limited government and provide greater protection for all firms than do other systems. Their visible political-legal systems increase the confidence of firms that their interests will be protected by law, thus reducing the risk and raising trade flows into democracies. Furthermore, democracies are less subject to political pressure to protect domestic firms from international competition. Although all governments provide some protection to domestic firms, the open political processes of democracies are more likely than other systems to render the costs of such protection visible and allow countervailing pressure groups to organize and lobby against such protection (cf. Root 1994, chapter 3). Leaders in other systems are more likely to rely on the provision of private goods to their supporting coalition to hold office than are democratic leaders, and trade barriers that favor particular firms are one way for leaders to provide benefits to their supporters (Bueno de Mesquita et al. n.d.). To be sure, democracies are not immune to protectionist pressures, but they are better able to contain them than are more closed systems of government.

Economic agents also have material incentives to prefer trade with countries that have political and economic systems similar to their own. Business disputes in international trade may be resolved in the legal and political system of a trading partner. Economic agents are more likely to understand how to operate within political systems similar to their own than in those that differ. Firms familiar with operating

in corrupt systems are more likely to understand the rules of the game in other corrupt systems than are firms accustomed to operating under the rule of law.

Economic systems themselves also matter, and they are closely connected to political systems. In particular, trade between an open and a managed economy presents special problems, since firms in open economies are likely to be privately owned, as opposed to state-owned firms or agencies in closed economies. Each type is accustomed to operating under a different system, free markets versus centrally planned economies, and neither type deals with the other frequently except in international trade. Different economic systems resolve disputes between economic agents in different ways, undermining trading agents' ability to predict their legal vulnerability. Open economies and open politics typically occur together, so the coincidence of these political systems reinforces higher levels of trade. Mansfield, Milner, and Rosendorff (1997) argue that pairs of democracies negotiate lower barriers to trade than do nondemocratic dyads precisely because legislatures in democracies often represent protectionist interests. The threat of trade war, and the higher barriers that would result, give democratic leaders the ability and motivation to negotiate lower trade barriers than leaders in other systems would negotiate.

Dixon and Moon (1993) test the effect of joint democracy on trade flows by analyzing U.S. exports to a range of countries between 1966 and 1983. They estimate the effect of common political systems on trade by determining whether the importer was democratic, as measured by the Polity II democracy scale (Gurr, Jagers, and Moore 1989, 1991). Because the United States was a democracy during this period, the dyad was democratic if the importing nation was also democratic. The results indicate that U.S. exports were greater to democratic trading partners.³

Bliss and Russett (1998) draw upon a body of data that includes between 882 and 1,042 pairs of states in the period 1962 to 1989 to assess the extent to which shared democratic political institutions have an effect on trade between states. Though they use a broader sample of states and employ different control variables, they arrive at results fully consistent with those of Dixon and Moon: Democratic states trade more with each other than they do with states that have other

³ Their results are more complex than this summary. Dixon and Moon report that the coefficient for institutionalized democracy has the correct sign but falls short of conventional levels of statistical significance. By examining the interaction of democracy and UN voting agreement, they conclude that joint democracy is contingent upon voting patterns; that is, joint democracy has its greatest effect when similar UN voting patterns are absent. That said, their initial judgment about joint democracy may be too conservative for two reasons. First, their hypothesis is clearly directional, and under the appropriate one-tailed test, the reported *t*-ratio of 1.8 is significant at the .05 level. Second, their data set includes only states that actually received exports from the United States. Nondemocracies such as North Korea, North Vietnam, Cambodia, Mongolia, Iran, and Cuba are missing, given the period of the study (1966–83). The inclusion of these states would undoubtedly have strengthened the relationship between democracy and trade.

types of political systems, even when controlling for such things as distance, the size of the economy, and alliance bonds.

Our next hypothesis deals with the effect of political systems on trade.

HYPOTHESIS 2: *Democratic dyads have greater trade flows than nondemocratic dyads.*

Limited government encourages trade by reassuring foreign firms that their trading interests will be protected from arbitrary treatment. Since democracies, in our sample, are generally also limited governments, they should be more able to resist pressure to shield domestic firms from international competition than are other political systems. Trade flows between democracies should be greater than between similar nondemocratic nations or pairs of states with differing systems. Because democracies tend to have limited government and an open economy, democratic dyads have matching economic and political systems that encourage trade.

Security

International trade may affect national security. Since trade increases both states' wealth, if a state were to invest its gains from trade into increased military capability, then it would gain a military advantage over its trading partner. Trade then could create a "security externality." A state might impede trade with another for fear that the latter would use the benefits of the trade to build up its military and so pose a greater threat to the former.

Gowa (1989, 1994) and Gowa and Mansfield (1993) develop a rigorous argument based on this idea. Enemies have good reason to fear what one another might do with their gains from trade, but allies presumably pursue similar ends and so could gain from increases in one another's military. Put another way, trade poses a negative externality between enemies and a positive externality between allies. The former must fear what each other would do with the gains from trade, while the latter can only benefit from greater military spending by their trading partner.

The polarity of the international system adds a further dimension to this argument. It is widely recognized that alliances do not always last, and today's ally may be tomorrow's enemy. Nations should be more willing to trade with their allies when they believe in the credibility and durability of their mutual commitment. When a nation fears that its ally will exit their alliance for the other side, it will be reluctant to allow that ally to gain the benefits of trade. Neorealists assert that alliances are more reliable in a bipolar system than in a multipolar system, and so the fear of exit is less in bipolar systems (Waltz 1979). Consequently, allies in a bipolar system should have higher trade than other dyads, since they anticipate that their alliance will persist and so do not fear the security externality that trade poses. In contrast, alliances should have little effect on trade in a multipolar system. According to neorealists, this is so since systemic pressures make

one's ally as likely to be one's future enemy as any other state. Given the propensity for changes of alliance partners in a multipolar system, trading with one's ally can be as dangerous as trading with one's enemy.

Gowa and Mansfield (1993) test this state-centered argument by examining trade flows between the major powers in nine different years between 1905 and 1985. In their cross-sectional design they estimate the effects of alliances on trade flows in each of the nine years in their sample and find that bilateral alliances in the bipolar era have the strongest positive effect on trade, followed by multilateral alliances under bipolarity. Alliances in the multipolar era generally have no statistically discernible effect on trade between the major powers. Interestingly, Gowa and Mansfield use their data to explore other reasonable explanations for trade flows, including, most notably, joint democracy, but they report that the results show a positive effect for this in only one of their nine cross-sections.

The following two related hypotheses test this argument.

HYPOTHESIS 3a: *In a multipolar system, trade between allies should not differ from trade between nonallies.*

HYPOTHESIS 3b: *In a bipolar system, trade between allies should be greater than trade between nonallies.*

The reader may be concerned that Hypothesis 1b is so similar to Hypothesis 3a and Hypothesis 3b as to be indistinguishable. Alliances generally do indicate similarity of relations, but this is not necessarily the case (Dingman 1979; Morrow 1991, 906). Nations with very close relations do not necessarily need alliances to coordinate their policies. Indeed, as we show below, our operational indicator of close relations within a dyad is not too highly correlated with an alliance in a dyad, although it is based on alliance data. There are, consequently, sound theoretical and empirical reasons for maintaining all three hypotheses.

Our test of all five hypotheses allows us to sort out possible confounding effects among the variables we use to test the three general arguments. Democratic dyads have less conflict than other pairs of states (Bremer 1992; Maoz and Abdolali 1989). Democracies tend to have close political relations and enter into alliances with one another (Gaubatz 1996; Siverson and Emmons 1991). Allies generally, but not always, have good relations. Given these possible relationships, it is conceivable that a separate test of any one of the five hypotheses could be confounded by the effects of variables from another of the arguments. Our test controls for such confounding effects by examining all the variables at once.

Furthermore, the results reported by Pollins as well as Dixon and Moon are based upon data from the Cold War, an unusual period of history. Two strong ideological blocs faced each other, and domestic systems, common interests, and alliances are all closely linked in the history of the Cold War. To separate the effects of the three arguments, we must analyze trade patterns from both the Cold War and some other period. If the arguments above are truly general, they will survive a

competitive test across different periods of international history.

DESCRIPTION OF THE DATA AND MEASUREMENT OF VARIABLES

To test our hypotheses we rely on a cross-sectional time series broader than any used to date. This design has two important advantages: First, the tests allow us to separate the effects of each variable while controlling for the other possible political effects on trade flows. Second, the longer historical period introduces greater variation than previously in all the independent variables.

We collected data for all the major powers at the beginning of the twentieth century—the United States, Great Britain, France, Germany, Russia, and Italy—matching the sample of Gowa and Mansfield (1993). Each directed dyad of these major powers forms one of our cases. For example, exports from France to Germany is one case, and exports from Germany to France is another. The seven major powers produce 42 cases. Our period is 1907 to 1990.⁴ The years 1914–19 and 1939–47 are excluded, due to the lack of trade data during the wars and its low reliability in the years immediately afterward. Each observation records the trade flow from one major power to another during one year in this domain.⁵ Each of the 42 cases has 71 yearly observations, giving a total of 2,982 possible observations, but missing data reduce our set to 2,631 cases.⁶

Controls for economic conditions must be introduced to discern the effects of political variables by themselves. Like Pollins (1989b), Dixon and Moon (1993), and Gowa and Mansfield (1993), we begin with a “gravity model” of international trade drawn from economics (Aitken 1973; Anderson 1979; Bergstrand 1985). The gravity model is purely an empirical framework that has had success in predicting trade flows; it

lacks a theoretical basis within the economic literature because it is not derived from macroeconomic premises. It serves us as a useful control for economic determinants of aggregate trade flows. The gravity model assumes that the physical distance between trading partners, the size of their economy, and their level of development affect the trade between them. The farther apart two states, the less their trade will be, since transportation costs are higher. The greater each state's GNP, the greater will be the amount of trade between them, because the marginal propensity to import is positive. Finally, all else equal, the greater is each state's population, the less trade, because larger domestic economies typically engage in less international trade.

We use constant values in U.S. dollars to measure exports and GNP in order to minimize the effects of changing price levels and inflation over time.⁷ We first convert nominal values in national currency to current U.S. dollars and then convert the current dollar values to constant 1947–48 dollar values. The current exchange rate controls for national currency inflation relative to the dollar, and the constant dollar conversion controls for inflation of the U.S. dollar.

Our control variables from the gravity model are the *GNP of the Exporter* (GNPI) and *GNP of the Importer* (GNPJ), in millions of constant U.S. dollars; the *Total Population* of each trading partner (POPI and POPJ), in millions of people; and the *Distance* between states (DISTANC).

Our dependent variable is the value of *Exports from State i to State j*, in millions of constant U.S. dollars (EXP).

To test our five hypotheses, we employ independent variables measuring conflict, interests, joint democracy, and the presence of an alliance under conditions of both bipolarity and multipolarity. We discuss each of these in turn. Other studies of the relationship between conflict and trade use event data to assess the level of conflict in a dyad. Instead, we use the presence of a *Militarized Dispute* for three reasons. First, event data include a variety of acts that directly reduce trade, such as retaliatory sanctions and trade embargoes. The first argument contends, however, that conflict leads states to adopt measures that directly reduce trade. Including measures that reduce trade as evidence of conflict biases the study in favor of a positive result. Second, if international conflict leads to national policies to reduce trade with the other side, then certainly militarized disputes—the most signal conflicts in which nations engage, short of war—should lead to a reduction in trade. If disputes do not reduce trade, then we must question the direct effect of political conflict on trade flows. Third, event data measuring conflict between states in the period before 1939 are not available. Our use of disputes as the measure of political conflict allows us to include years before World War II, increasing the variance in our independent variables.

We test the direct effects of conflict on trade flows by

⁴ After 1949, data are for the Federal Republic of Germany only; prior to 1917, data for Russia are used.

⁵ A referee was concerned that our use of directed dyads could result in observations that are not independent of one another. In particular, many of our measures of the independent variables are dyadic, and so we have two directed dyads with the same values of many of the independent variables. A conservative approach would be to eliminate one of each pair of directed dyads in our sample, which would reduce our sample size by one-half. An alternative adjustment would be to consider our effective sample size to be one-half the actual sample size. In that case, simply divide all the *t*-scores by $\sqrt{2}$. We discuss the consequences of such an adjustment for our results in a subsequent footnote.

⁶ The missing data are limited to the economic components of the gravity model. The elements of the missing data have different consequences. There are 17 nation-years for which export data are lacking. Because we use directed dyads, this results in missing data for 102 cases. Ten nation-years have no population figures, which creates missing data for 120 cases, since the population of the exporting state in one directed dyad becomes the population of the importing state in the respective directed dyad for the importer. Similarly, GNP is missing for 21 nation-years, creating missing data for 252 cases. Of course, in some cases the missing data overlap. In total, because one element or another of the economic and demographic information is missing, the size of the data set is reduced by slightly more than 11%.

⁷ Details on the sources of the data and measurement procedures for the economic variables are given in the Appendix.

examining whether the importing and exporting states were engaged in a militarized interstate dispute (MID) with each other in that year. A militarized interstate dispute occurs when at least one member of the dyad has made a threat to use force against the other (Gochman and Maoz 1984). We code dyad-years with a militarized interstate dispute as 2, those without as 1.⁸ The hypothesized direct relationship between political conflict and trade (Hypothesis 1a) predicts that the sign on this coefficient should be negative and statistically significant.

Following Bueno de Mesquita (1975, 1981), we operationalize *Common Interests* in a dyad of states by the $\tau_{i,j}$ correlation of their alliance portfolios (TAU). This revealed-choice measure of interests assesses the complete array of alliances that the member states of the dyad hold in common and apart. To assess the $\tau_{i,j}$ measure for a dyad, a four-by-four table that compares both states' alliance commitments is constructed. The four rows and columns of the table correspond to the four levels of commitment, in descending order, given in the Correlates of War military alliance data: defense pact, nonaggression pact, entente, and no alliance. Each state in the system, including the members of the dyad, is placed in the cell corresponding to the commitments that each member of the dyad has with that state. When placing the dyad members with respect to each other, each is assumed to have a defense pact with itself. The $\tau_{i,j}$ measure of shared interests is the $\tau_{i,j}$ value of the resulting table of the alliance commitments of the states in the dyad with all states in the system. Although $\tau_{i,j}$ is correlated with the presence of an alliance in the dyad, the existence of an alliance accounts for only about half the variance in the $\tau_{i,j}$ values in our sample, so *there is significant variation in the $\tau_{i,j}$ values for which the presence of an alliance in the dyad does not account.*⁹ Negative $\tau_{i,j}$ values should also weakly predict the presence of conflict in a dyad, in line with the argument that common interests are a signal of lower political risk. The theoretical range of $\tau_{i,j}$ values is -1 to 1 . We add 1 to these to get the value of TAU in order to avoid the possibility of multiplying the value predicted by the other variables by a negative number.¹⁰ For the relationship between common interests and trade flows (Hypothesis 1b), this

coefficient should be positive and statistically significant.

Hypothesis 2 addresses whether *Democratic Dyads* have higher trade flows than other dyads. We consider as democratic those states that score 6 or above on Gurr's 11-point scale (0–10) of institutionalized democracy (Gurr, Jagers, and Moore 1989, 1991). If both members of a dyad are democracies, the dyad is democratic. We code democratic dyads as 2 and non-democratic dyads as 1 (DEMD). Hypothesis 2 about democratic dyads and trade predicts this coefficient should be positive and significant.

We draw our list of *Alliances* from the Correlates of War list of mutual formal alliances between the states.¹¹ We use this list both to calculate the $\tau_{i,j}$ values and as the indicator of when alliances existed for testing hypotheses 4 and 5. Testing this pair of hypotheses requires two independent variables in order to distinguish the hypothesized positive effects of alliances under *Bipolarity* and their lack of effect under *Multipolarity*. We code the existence of an alliance in a dyad-year as 2 and use 1 for the absence of an alliance (ALLIA). Following Waltz (1979), we classify the international system as multipolar before World War II and bipolar afterward. We construct the interactions of multipolarity and bipolarity with the presence of an alliance, calling the variables MULTIAL and BIAL, respectively. MULTIAL is 2 if an alliance exists in a dyad-year before 1947 and 1 otherwise. BIAL is 2 if an alliance exists in a dyad-year in or after 1947 and 1 otherwise. The combination of these two variables allows us to test hypotheses 3a and 3b. They predict that the coefficient for an alliance under multipolarity should not be statistically significant, but the coefficient for an alliance under bipolarity should be significant and positive.

Finally, the functional form of the gravity model is multiplicative, as follows, where ϵ_{ijt} is an error term, such that $\ln(\epsilon_{ijt})$ is normally distributed with mean 0:

$$\begin{aligned} EXP_{ijt} = & \alpha (GNP_{it}^{\beta_1})(GNP_{jt}^{\beta_2})(POP_{it}^{\beta_3})(POP_{jt}^{\beta_4}) \\ & (DISTANC_{ijt}^{\beta_5})(TAU_{ijt}^{\beta_6})(DEMD_{ijt}^{\beta_7})(MID_{ijt}^{\beta_8}) \\ & (MULTIAL_{ijt}^{\beta_9})(BIAL_{ijt}^{\beta_{10}})\epsilon_{ijt} \end{aligned}$$

State i denotes the exporter, state j the importer, and t the current year. We transform this equation into a linear relationship by taking the natural logarithm of all the variables. We indicate this transformation by adding the letter L to the end of each variable name and estimate the following linear equation:

⁸ We use values of 1 and 2, respectively, for the presence and absence of these variables in place of the conventional 0 and 1 values for dummy variables. Adding one to the conventional values for dummy variables ensures that the absence of the condition does not change the value predicted by all other variables in the gravity model, and the presence of the condition multiplies that value by a fixed amount determined by the coefficient of the dummy variable.

⁹ For a discussion of the theoretical and empirical differences between $\tau_{i,j}$ and bilateral alliances as a measure of common interests, see Bueno de Mesquita (1981, 111–8 and especially Figure 4.1).

¹⁰ The minimum value of the $\tau_{i,j}$ scores in the data set is $-.475$; adding 1 suffices to avoid infinite negative logarithms. A referee suggested manipulating the minimum value of the $\tau_{i,j}$ values to ensure that the minimum value of TAU equaled 1. Then the logarithm of the minimum value of TAU would be 0. This transformation could prevent any distortion introduced by taking the logarithms of values of TAU close to 0. We have replicated our analyses using this specification of TAU. The results produce the same

pattern of coefficients presented and discussed in this paper but with some minor improvements in significance probabilities.

¹¹ The alliances we use are drawn exclusively from the COW listing (Small and Singer 1969). Gowa and Mansfield (1993) add a bilateral alliance between the United States and Japan to the COW listing for the bipolar era. It is the only bilateral alliance their data contain for this period. The Japanese-American Security Agreement, on which they base their coding, is widely regarded as a protectorate and not an alliance, since it does not carry reciprocal obligations.

ESTIMATION STRATEGY

Time-series cross-sectional analysis presents a variety of statistical problems for estimation. Ordinary least squares (OLS) estimates of the coefficients are unbiased but may not make the most efficient use of the information in the data. The error terms cannot be expected to have the same variance across the cross-section and be independent over the time series and across the cross-section. That is, the error terms may be heteroskedastic, autocorrelated, and contemporaneously correlated. The primary effect of such an error term is that the estimates of the standard errors of the estimated coefficients are inaccurate.

The common response to this problem has been to use a variety of generalized least squares techniques (GLS) to render the error term spherical (Parks 1967; Stimson 1985). Such techniques use residuals of OLS to estimate the error structure and transform the data, using the estimated error structure to run GLS. Asymptotically, these procedures produce efficient, unbiased estimates of the coefficients and their standard errors.

Recent research shows, however, that the cure may be worse than the affliction (Beck and Katz 1995). GLS techniques are efficient only if we know the true error structure. Since we do not know that structure generally, it is usually estimated from the data. These estimates can rely on small effective sample sizes and so be inaccurate in small samples. For example, the effective sample size for estimates of the contemporaneous correlations is about $2T/N$, because $N(N-1)/2$ correlations are estimated using NT observations. When the length of the time series is close to the number of cross-sectional units, as is the case in our analysis, each individual correlation is highly dependent on the data. Because the effective sample size is small, one or a few individual cases may be highly influential. The estimated standard errors of the coefficients are likely to be smaller than the actual variance of the coefficients, and consequently statistical tests using these inaccurate standard errors are likely to lead to overconfidence in the statistical significance of our estimates.

Beck and Katz (1995) suggest a solution to this problem: Use OLS to estimate the coefficients but correct the estimated standard errors using contemporaneous correlations estimated from the residuals. They call these estimated standard errors panel-corrected standard errors (PCSEs). Their Monte Carlo analysis demonstrates that PCSEs are more accurate estimates of the standard errors of the coefficients than those recommended by Parks (1967). They also recom-

mend that any correction for serial correlation be common across the cross-sections, rather than estimating a separate serial correlation for each cross-section. We implement Beck and Katz's technique by estimating and removing a common serial correlation, estimating the coefficients using OLS on the transformed data, and using the residuals of this analysis to estimate the PCSEs.¹²

This technique is an improvement over the estimation procedures used by earlier studies. Both Pollins (1989a, 1989b) and Dixon and Moon (1993) estimate different autocorrelations for each cross-section. Such procedures create the possibility of incorrect standard errors and misleading statistical tests. Of course, Beck and Katz's research had not been done when Pollins and Dixon and Moon did their estimations. In addition, Gowa and Mansfield's (1993) cross-sectional design does not take advantage of the time-series nature of the data. Furthermore, it is difficult to interpret the range of time-specific coefficients Gowa and Mansfield report.

Our data suffer from two problems. First, as noted earlier, we are missing economic or demographic data for some states in a few years, and we delete these observations. Second, the two world wars create two interruptions in our time series, one from 1914–19 and the other from 1939–46. Both the missing data and the wars create interruptions in the time series. We deal with these interruptions when we remove the serial correlation. We use the Prais-Winstone transformation, which treats the first term of a time series differently from the following observations (Prais and Winston 1954). We consider each observation that does not have an observation from the prior year as the beginning of a new time series. For example, all observations for 1920 receive the Prais-Winstone treatment as the first term in a time series.¹³

STATISTICAL RESULTS

Our primary specification tests the three arguments about the effects of international politics on trade flows. All the hypotheses are tested in this specification. It includes the following exogenous variables, labeled by the corresponding hypothesis: (1a) whether a dispute occurred between the members of the dyad in that year, (1b) the τ_{ab} measure of alliance similarity between the two members of the dyad, (2) whether the dyad was a pair of democracies, (3a) whether an alliance existed between the members of that dyad, and (3b) the interaction of whether an alliance existed with whether the system was bipolar. The coefficient for the τ_{ab} value tests the hypotheses that the similarity of international political relations increases trade. A pos-

¹² PCSEs and all statistical estimations were calculated by a GAUSS program written by James Morrow. The program, which is designed to analyze this data set rather than be a general implementation of the Beck-Katz procedure, can be obtained from Morrow.

¹³ The first observation after an interruption in the series is transformed to $y_t = x_t(1 - \rho^2)^{1/2}$, where x is the original variable, y the transformed variable, and ρ the estimated serial correlation. The following observations are transformed to $y_t = x_t - \rho x_{t-1}$.

itive coefficient supports this hypothesis. A negative coefficient for the occurrence of a dispute supports the hypothesis that conflict lowers trade. The coefficient on whether the dyad is democratic tests the hypotheses that within a pair of democracies trade should be higher than within other pairs of nations. A positive coefficient supports this hypothesis. The pair of alliance variables interacted with the polarity of the system test the hypotheses that alliances under bipolarity increase trade, while alliances under multipolarity have no effect. This argument is supported if the coefficient for alliance is not significant, and the coefficient for the interaction of bipolarity and alliance is positive.

Table 1 presents the results of our primary specification. These results support part of the first argument, all of the second, but the third not at all. Since the coefficient reporting the estimated effect of a militarized interstate dispute on trade is not statistically significant, Hypothesis 1a is not supported. Both democratic dyads and similarity of political relations (i.e., high τ_{ij}) increase trade flows, as hypotheses 1b and 2 assert. An alliance, however, increases trade under multipolarity and decreases it under bipolarity, the exact opposite of hypotheses 3a and 3b. Furthermore, all the control variables of the gravity model have the expected signs, and all but the population of the exporting state are statistically significant.

Because our exogenous variables are correlated and colinearity might lead us to confuse the effect of one

variable with another,¹⁴ we have run a variety of specifications to test the robustness of the results beyond those given in Table 1. These analyses are presented in Table 2. In each alternative model, we drop one or more of the independent variables to check the stability of the estimated coefficients. In several runs, we investigate the effect of alliances without respect to the polarity of the system; this variable is listed as ALLIAL in Table 2. Our results are robust to these checks. The same clear pattern of coefficients holds across all models: Similarity of relations and democratic dyads always have higher trade flows, while alliances sometimes increase trade and at other times decrease it. Alliances under multipolarity are more favorable to trade than alliances under bipolarity (except for model 10).¹⁵ The pattern of the control variables is also stable to these variations. Multicollinearity, then, does not threaten the inferences about the hypotheses that we draw from our data.¹⁶

There are two additional threats to the validity of these results: (1) nonspherical errors even after the correction for a common serial correlation and (2) endogeneity in the independent variables. We checked the residuals of our main analysis for evidence of nonspherical errors that might be caused by, for example, heteroskedasticity. The first ten partial autocorrelations of the residuals are all less than .3, and all but one are less than .1. We also calculated the mean residual of each cross-section. A substantial number of these means differing from 0 implies that the cross-sections exhibit heteroskedasticity. Only four of the 42 cross-sectional means of the residuals were statistically discernible from 0 at the .05 level. Because of the clarity of these patterns, we have confidence that

¹⁴ The correlations between these variables are:

	MIDL	TAUL	DEMDDL
MIDL			
TAUL	-0.14		
DEMDDL	-0.14	0.45	
ALLIAL	-0.06	0.72	0.26

¹⁵ The reader may wonder why we find such different results on the effects of alliances and polarity from those of Gowa and Mansfield (1993). OLS analyses of our data before correcting for serial correlation produce similar results to Gowa and Mansfield's analysis. The dependent variable, logged imports, and the three main independent variables, similarity of political relations, joint democracy, and the presence of an alliance, all have substantial persistent autocorrelation. For instance, the tenth-order autocorrelation between values of flows of imports in a directed dyad in a given year and ten years later—the approximate separation of the individual cross-sections in Gowa and Mansfield (1993)—is .536.

¹⁶ If we adopt the conservative step of treating our effective sample size as one-half of our number of observations, as discussed in footnote 5, we divide all the t -scores by $\sqrt{2}$. Then alliances under multipolarity are significant at the .05 level instead of the .01 in models 4 and 9. Alliances under bipolarity are significant at the .05 level instead of the .01 level in the main model and model 1. Alliances in general are significant at the .01 level instead of the .001 level in models 6 and 8. The statistical significance of all other coefficients does not change. In short, treating our effective sample size as one-half of our number of observations weakens the results only for alliances. All of our inferences about the three arguments remain the same after this conservative procedure.

further adjustment of the data is unnecessary to render the errors spherical.

Simultaneity bias would arise if trade causes one or more of our exogenous variables. In particular, trade is often believed to mitigate conflict. Several arguments have been advanced on behalf of this, but they all hinge on the presumed beneficial effects of trade between states. Under theories of interdependence (Keohane and Nye 1977; Nye 1971), trade creates a web of beneficial interdependence between states that dampens conflict by raising its costs. Similarly, Polachek (1980) argues that states will attempt to avoid conflicts with their trading partners in order to preserve the gains from trade. To test for the possibility that trade reduces conflict, we ran several different probit analyses that tried to predict the occurrence of conflict using trade flows, distance, and our other political variables. In our first analysis, we simply used militarized interstate disputes as the dependent variable and trade as the independent variable in a logit. In this bivariate analysis the coefficient for trade is $-.002$ and statistically significant ($p < .001$), indicating that trade did dampen conflict. Yet, when the political variables for similarity of political relations, joint democracy, and the presence of an alliance and distance are added to the logit, the coefficient for trade falls to $-.0002$ and is not significant, while the coefficients for similarity of political relations and joint democracy are -3.54 and -3.19 , respectively, and both are significant ($p <$

$.001$). The coefficient for the presence of an alliance is significant, but it is positively signed (1.02 , $p < .01$). The coefficient for distance is negative and not significant. Similar results were obtained when we analyzed the same specifications and lagged the independent variables by one period. When controls for joint democracy, foreign policy similarity, alliance, and distance are included, trade does not have a statistically significant effect in predicting the occurrence of a militarized dispute in our data set, whether we tested for trade flows in the year of the dispute or the year prior to it. Consequently, we do not believe that simultaneity bias is a significant threat to our analyses.¹⁷

¹⁷ For a further analysis of this, see Morrow, Siverson, and Tabares (1998). The empirical literature on this relationship is growing. In recent work, Oneal et al. (1996) and Barbieri (1996) have reported somewhat differing results. The former, drawing upon a broad data set of politically relevant states from the post-World War II era, report that conflict is less likely between states when their trade is significant or they are democratic. Barbieri (1996), using data on international trade and conflict between 1870 and 1938, reports results in which trade can both increase and decrease conflict, with peace being most likely when states have symmetrical trade with each other. In addition, using Granger techniques on a time series of trade and conflict for 16 dyads over the period between 1960 and 1992, Reuveny and Kang (1996) report results showing that increased trade can bring either more or less conflict. Plainly, this research question remains open, but insofar as our results are concerned,

DISCUSSION

Trade patterns between the major powers during the twentieth century broadly support the first two arguments but not the third. Common interests and mutual democratic institutions increase trade flows between states. The effect of alliances on trade flows is uncertain; they may increase or decrease trade. Trade flows are higher between allies in multipolar system than between allies in bipolar systems. These results are robust, even given the interrelated patterns of the variables. Although democracy, common interests, and alliances are often found together in this period, the results do not change when one or more of these variables is dropped from the analysis. Our sample also contains greater variation on these variables than earlier studies, making it easier to separate the effects of different variables.

If politics does influence trade flows, then how large are the effects? Table 3 gives the estimated effect of changes in trade flows for the specified change in the political variables. Because the gravity model is multiplicative, these effects are given as percentage changes.¹⁸ Holding all other political and economic

variables constant, a dyad composed of democratic states has more than double the trade of a nondemocratic dyad. Political relations also have large effects on trade flows, but alliances and disputes have only relatively small effects. For the sake of comparison, we have estimated the effects of all the political variables on trade, even those whose effects were not statistically significant in Table 1.

There is another way of looking at the size of these political effects on trade. We tested the statistical significance of our political variables as a set.¹⁹ Com-

MID, and TAU to ensure that their logarithms were positive. An example may clarify how the figures in Table 3 were calculated. A democratic dyad multiplies the effect of the other variables by $2^{1.221} = 2.331$, where 1.221 is the estimated coefficient of the effect of a democratic dyad in Table 1, and 2 is the coded value of a democratic dyad. A nondemocratic dyad multiplies the effect of the other variables by $1^{1.221} = 1$. Moving from a nondemocratic dyad to a democratic dyad increases trade by a factor of 1.331 ($= 2.331 - 1$), or 133.1%, assuming all other variables are fixed.

¹⁹ A joint hypothesis test compares a regression with all the political variables included to a regression without the political variables (Hanushek and Jackson 1977, 128). The test statistic is calculated as the difference in the sums of squares divided by the number of political variables over the sum of squares of the equation including the political variables, divided by the degrees of freedom in that equation. The test statistic has an *F*-distribution with degrees of freedom of the number of political variables and the degrees of freedom of the equation including the political variables.

simultaneity does not appear to be a problem with respect to the conclusions we draw.

¹⁸ The percentages in Table 3 are calculated from the estimated coefficients in Table 1 using the multiplicative functional form of the gravity model. As noted earlier, we added 1 to DEMD, ALLIA,

TABLE 3. Estimated Effects of Political Variables on Trade Flows

Change in Political Variables	Effect of the Change on Trade Flows
From nondemocratic dyad to democratic dyad	Increases trade 133.1%
Occurrence of a militarized dispute	Increases trade 1.1% ^a
Formation of an alliance	
Under multipolarity	Reduces trade 11.7% ^a
Under bipolarity	Reduces trade 29.1%
Change in similarity of relations	
From negative to neutral (TAU from -.5 to 0)	Increases trade 172.8%
From neutral to positive (TAU from 0 to .5)	Increases trade 79.9%
From negative to positive (TAU from -.5 to .5)	Increases trade 390.1%

^aThese estimates are based on coefficients that were not statistically significant at the .05 level. We include the estimated effect to illustrate the estimated relative effect of these changes in the political variables compared to the changes that had statistically significant effects.

pared with a model of only the economic control variables, the complete set of political variables is significant at the .001 level. If we restrict our attention just to joint democracy and similarity of relations, the two most successful variables in our test, then the political variables add to the economic model at significance levels of .05 or less.²⁰ Our political variables do account for something the economic model alone misses.

Our evidence challenges neorealist arguments. When we do not control for joint democracy and relations between states, alliances have a positive effect on trade that is statistically discernible. Our evidence clearly shows, however, that domestic institutions and relations have a much larger effect on trade flows than do alliances. Furthermore, trade flows are higher between allies under multipolarity than under bipolarity. According to the neorealist position, the opposite should be true, because neorealists contend that the risk of exit from an alliance is less in bipolarity than multipolarity. The complete neorealist position on trade and alliances—namely, that alliances increase trade between the members and are more reliable under bipolarity than multipolarity—is incompatible with our evidence.²¹

Our evidence does not support the position that security concerns lead states to control their trade flows. Trade flows during the Cold War were primarily within, rather than across, the Eastern and Western blocs. But each of the three arguments—political relations, joint democracy, and security concerns—

predict this pattern. Our evidence suggests that common interests and political institutions fostered trade within each bloc. To be sure, some goods were banned for trade between the blocs because of their strategic importance, such as computers (Morrow 1997), but the argument that security concerns affect trade flows conflates the need to monitor trade over *certain goods* into a belief that states must watch *all trade flows*.

Our evidence indicates that other factors are more important than alliances. Prime among these are joint democracy and the similarity of policy interests between the states. The positive effects of joint democracy are in accord with the theoretical position of Pollins. He argues that private economic agents (i.e., individuals and firms) are the central actors; for Gowa the state is the central actor. Liberal democratic states give private economic agents the greatest scope to act on their judgments about what business they should pursue. Those active in foreign commerce are likely to be particularly interested in the various risks attached to trade. One of these risks is that the other party may violate a contract. The risk posed by such violations is very different when the trading partner is a firm in a state with a legal system that recognizes contracts than when the trading partner is a government firm in a state that may not recognize the contract or interprets the contract in accord with the immediate interest of the state rather than a body of law. These are the risks we outlined above, and they seem to make a difference.

Politics affects trade flows because economic actors care about political risks. International conflict disrupts trade, introducing risk. The institutions of limited government reassure actors, reducing risk. Democracy by itself is not a panacea for increasing trade. But modern democracies generally have been limited governments. Democracies are also less likely to engage in violent conflict with one another (Bremer 1992; Maoz and Abdolali 1989). Both of these effects raise trade between democracies. Furthermore, economic actors anticipate these political effects. The anticipation of conflict prevents trade from growing more than the realization of conflict leads to its disruption.

Finally, we end on a note of caution about our results. We have found evidence about the effect of politics on international trade at the level of overall trade flows. We use a broader sample of data with greater variation and more appropriate methods for that data than do existing studies. Further support for these arguments must be found at lower levels of analysis than aggregate trade flows. If limited government does encourage trade, then there should be direct evidence at lower levels, such as the individual trading concern. If economic agents fear the political disruption of trade, then that risk should be reflected in which international trading businesses are established. If security concerns lead governments to manage their aggregate trade flows, then the mechanisms of such management must exist.

²⁰ The F -scores for each comparison are: $F^5_{2621} = 5.67$ for the complete model and $F^2_{2624} = 88.24$ for just similarity of relations and joint democracy.

APPENDIX: MEASUREMENT

Exchange rates for 1907 to 1920 for France, Germany, Italy, Japan, and Great Britain were taken from Bidwell (1970) and Liesner (1989); for 1921 to 1929, rates used were from the U.S. Census Bureau (1928, 1931); and from 1930 to 1990, rates were taken from the United Nations (1955, 1966, 1994). Constant dollar values were obtained using the consumer price index (CPI) provided in the U.S. Census Bureau (1947, 1962, 1995) and derivations thereof.

Data on GNP from 1907 to 1965 were taken from Mitchell (1980, 1982, 1983, 1992) and Clarke and Matko (1983). For the period from 1907 to 1922, reliable data on Soviet GNP are difficult to obtain. In this case, estimates were made from data in Bairoch (1976). GNP from 1966 to 1990 were taken from the International Monetary Fund (1995) for all countries except the Soviet Union. Soviet GNP from 1966 to 1988 was taken from Mitchell (1992). Population data for 1907 to 1965 were taken primarily from Liesner (1989). Population figures for France for all years were taken from Maddison (1991), but these were also supplemented. Data for Italy from 1909 to 1950 were from Istituto Centrale di Statistica (1958); for the Soviet Union, from 1907 to 1913, data were from Mitchell (1992), from 1920 to 1939 from Eason (1963), and from 1950 to 1965 population was from Clarke and Matko (1983). Population from 1966 to 1990 was taken from the International Monetary Fund (1995) for all countries except the Soviet Union. Soviet population from 1966 to 1988 was taken from Mitchell (1992); Soviet population figures for 1989 and 1990 are from Karasik (1992). Geographical distance is the shortest distance between capital cities. Prior to 1949, Berlin is used as Germany's capital. Data on geographical distances are from Fitzpatrick and Modlin (1986).

The primary source of export data for 1907 to 1965 was Mitchell (1980, 1982, 1983). Exceptions to this follow. France's exports to Japan and the Soviet Union for all years were taken from Bureau de la Statistique Générale (1900–11, 1932, 1966). Germany's exports to Japan from 1907 to 1954 were calculated from reported Japanese imports from Germany; for 1955 to 1965 data were taken from the United Nations (1959, 1961, 1966). Italy's exports to Japan and the Soviet Union for all years were taken from Istituto Centrale di Statistica (1912, 1914, 1922–25, 1929, 1933, 1936, 1939, 1941, 1952, 1959, 1962, 1966). The Soviet Union's exports to France, Germany, Italy, Great Britain, and the United States from 1909 to 1913 were taken from Miller (1967); exports to Italy, Japan, and the United States from 1913 to 1965 were taken from Clarke and Matko (1983). Great Britain's exports to Italy and Japan for all years came from Great Britain Central Statistical Office (1914, 1928, 1938, 1953, 1961, 1967). U.S. exports to Italy and the Soviet Union for all years were taken from the U.S. Census Bureau (1912, 1919, 1921, 1928, 1931, 1933, 1938, 1940, 1941, 1947). Japan's exports to Italy and the Soviet Union for all years were taken from the Japanese Department of Finance (1916, 1936, 1940). Export data from 1966 to 1990 were taken from the International Monetary Fund (1971, 1978, 1985, 1992).

Administrative Procedures and Political Control of the Bureaucracy

STEVEN J. BALLA *The George Washington University*

Positive theorists have argued that administrative procedures enhance political control of the bureaucracy, in part by predisposing agencies toward policy choices preferred by legislators' favored constituents. Although this "deck-stacking" argument has been both influential and controversial, few scholars have subjected it to empirical examination. This article assesses the operation of a prominent administrative procedure—the notice and comment process—in the context of Medicare physician payment reform, a fundamental restructuring of the way in which the Medicare program pays for physician services. I find, contrary to the deck-stacking thesis, that the Health Care Financing Administration (HCFA) was more responsive to physicians expecting reductions in fees than to the intended beneficiaries of the new payment system. Although these results do not necessarily imply that Congress exerted little influence over HCFA decision making, they suggest that certain administrative procedures do not operate as instruments of political control.

Delegation of policymaking authority from elected officials to unelected bureaucrats is a fact of contemporary American politics. It does not, however, necessarily imply abdication, as officeholders possess instruments that potentially limit bureaucratic discretion. Presidents, for example, fill many high-level agency posts with appointees whose preferences closely resemble those of the chief executive. Members of Congress regularly conduct oversight hearings, which are proceedings designed to monitor and, if necessary, redirect agency activity. The presence of these instruments raises a question of considerable importance for the operation of American democracy: To what extent do different types of instruments facilitate political control of the bureaucracy?

In recent years, numerous studies have addressed this question (e.g., Eisner and Meier 1990; Moe 1985; Wood 1988, 1990; Wood and Waterman 1991, 1993). These studies examine the effect of different instruments on decision making in several public bureaucracies, including the National Labor Relations Board, Equal Employment Opportunity Commission (EEOC), and Environmental Protection Agency (EPA). One finding common to most of this research is that patterns of bureaucratic output frequently change in response to personnel changes at the top of agencies. For example, the litigation activities of EEOC declined substantially after President Reagan appointed an ideological conservative to head the Office of General Counsel (Wood 1990). These studies also indicate that manipulation of agency budgets and close congressional scrutiny can, in certain contexts, enhance polit-

ical control. These results lead Wood and Waterman (1981, 821) to conclude that "at certain times in the cycle of U.S. politics, responsiveness permeates the U.S. bureaucracy."¹

The instruments at politicians' disposal are not limited to those examined in these studies. For example, members of Congress can establish administrative procedures (e.g., the public notification and participation requirements codified in the Administrative Procedure Act [APA] of 1946) that impose constraints on bureaucratic decision making. Thus far, scholarly attention to administrative procedures has been quite uneven. On the one hand, positive theorists have argued that administrative procedures are indispensable instruments of political control. On the other hand, students of legislative-executive relations have conducted few empirical tests of propositions derived from this argument. As a result, the extent to which administrative procedures actually limit bureaucratic discretion remains an open question.

The central aim of this article is to take a step toward answering this question. It examines the operation of a prominent administrative procedure—the notice and comment process—in the context of Medicare physician payment reform, a fundamental restructuring of the way in which the Medicare program pays for physician services. More specifically, the article addresses the effect of the notice and comment process on decision making at the Health Care Financing Administration (HCFA), the agency charged with establishing fees for thousands of services covered by the program. The following two sections review the positive theory of administrative procedures and discuss the politics of Medicare physician payments, respectively. The remaining sections present and highlight the implications of the analysis of HCFA decision making,

¹ Wood (1988) cautions against stating this conclusion too strongly, as agencies might retain considerable discretion despite the imposition of external controls. Eisner and Meier (1990), for example, find that changes internal to the Department of Justice were more important in explaining changes in antitrust policy than were political events, such as the Reagan revolution. In addition, Brehm and Gates (1996) demonstrate the importance of factors such as organizational culture and professional norms in explaining bureaucratic behavior.

which demonstrates that the notice and comment process did not facilitate congressional control of Medicare physician payment reform.

THE POSITIVE THEORY OF ADMINISTRATIVE PROCEDURES

Three decades ago, Harris (1964, 9) distinguished between two approaches to political control of the bureaucracy: "legislative decision or activities prior to the relevant administrative action . . . [and] inquiries about policies that are or have been in effect." Since then, much of the theoretical and empirical work on political control has focused on the latter approach.² McCubbins and Schwartz (1984), for instance, argue that legislators establish rules and procedures enabling interest groups and private citizens to examine agency actions and to alert Congress about noncompliant bureaucratic behavior. Weingast and Moran (1983) provide evidence that penalties imposed on the Federal Trade Commission in the late 1970s were the result of changes in the composition of relevant oversight committees, not a decade of agency intransigence.

Despite these arguments and findings, scholars have asserted that ex post oversight is limited in its ability to enhance political control. Legislators may not be able or willing to sanction recalcitrant agencies. Drafting new legislation and reducing agency budgets, two often-mentioned sanctions, require significant investments of congressional resources, resources that legislators may not possess or may prefer to devote to more electorally salient activities (Fiorina 1989; Moe 1987). Furthermore, these forms of oversight may be of limited utility in redirecting agencies. A coalition within Congress may prefer the policy choices made by bureaucrats to those intended by the enacting coalition (McCubbins, Noll, and Weingast 1989). In addition to this problem of "bureaucratic drift," congressional preferences may change over time, and new coalitions may tamper with carefully negotiated bargains (Horn and Shepsle 1989).

With these shortcomings in mind, McCubbins, Noll, and Weingast (1987, 1989) argue that ex ante administrative procedures are Congress's most effective instruments of political control.³ Administrative procedures increase bureaucratic accountability in three principal ways. First, administrative procedures enfranchise particular constituents: "Interests that are active participants in the debate over the original legislation should be given representation through the structure and process of the agency so that each will be protected against undesirable policy shift" (McNollgast 1989, 444). Second, administrative procedures increase the likelihood that bureaucrats incorporate the prefer-

ences of legislators' favored constituents into agency policies:

Through these decisions, political actors assure that the influence accorded to different constituents is not random; indeed, by controlling the details of procedures and participation, *political actors stack the deck in favor of constituents who are the intended beneficiaries of the bargain struck by the coalition which created the agency* (McNollgast 1987, 261).

Third, administrative procedures protect the interests of favored constituents over time; as their preferences change, bureaucratic decision making and policy outcomes change as well.

McNollgast's contribution to the study of political control is both important and controversial, as evidenced by the fact that scholars have extended, refined, and critiqued their "deck-stacking" thesis. Macey (1992) emphasizes that legislators can use agency structure, as well as process, to enhance bureaucratic responsiveness. The most straightforward example is the decision to create a single-industry agency; this structure increases the likelihood that agency decisions reflect the preferences of constituents to whom the agency is charged to deliver policy benefits. Formal models have refined the deck-stacking thesis by pointing out the limits of Congress's willingness to circumscribe agency autonomy (Bawn 1995; Epstein and O'Halloran 1994). Although stringent administrative procedures facilitate political control, they also hamper agency flexibility and stifle the provision of potentially valuable information. Legal scholars object to McNollgast's portrayal of administrative procedures as instruments of political control, maintaining that their primary function is to promote regulatory outcomes embodying principles "ranging from 'fairness' to 'efficiency' and utilizing a host of other ideas as well—'openness,' 'accountability,' 'legitimacy,' and 'rationality,' to name a few" (Mashaw 1990, 267; see also Robinson 1990). Finally, the reaction of students of public administration has been decidedly lukewarm. West (1995), for instance, argues that the principal-agent model on which the deck-stacking thesis rests is in some respects fatally flawed and promotes unnecessary oversimplification of a complex political process.

Despite this attention, few scholars have subjected hypotheses drawn from the deck-stacking thesis to empirical examination. A pair of analyses (Hamilton 1996; Hamilton and Schroeder 1994) demonstrate that although legislators established procedures designed to facilitate political control over implementation of the Resource Conservation and Recovery Act (RCRA), EPA retained significant policymaking discretion. Regulators promulgated certain RCRA rules through informal channels, such as interagency memoranda and guidance manuals, thereby circumventing formal procedural requirements. Furthermore, regulators' decisions to pursue informal rulemaking were strategic; the penalties associated with informal rules were higher than those associated with rules promulgated under the notice and comment process, an indication that EPA officials used informality to impose sanctions more

² I focus here on positive-theoretic approaches to the study of political control, given that this article assesses the veracity of the positive theory of administrative procedures. Scholars from other intellectual traditions have examined ex post oversight as well (e.g., Aberbach 1990; Dodd and Schott 1979; Ogul 1976; Rourke 1984; Wilson 1989).

³ Throughout the article, I refer to McCubbins, Noll, and Weingast as "McNollgast."

stringent than those preferred by members of Congress and the interests likely to participate in formal proceedings.

In this article, I address a different facet of bureaucratic response to administrative procedures—the effect on agency decision making of comments submitted in response to proposed rules. According to McNollgast (1987, 258), the notice and comment process facilitates political control in the following manner: “the entire sequence of decisionmaking—notice, comment, deliberation, collection of evidence, and construction of a record in favor of a chosen action—afford[s] numerous opportunities for political principals to respond when an agency seeks to move in a direction that officials do not like.” As a result, agencies have an incentive to take actions that are consistent with the preferences of legislators’ favored constituents, by, for example, responding to comments submitted by these constituents to a greater extent than to comments submitted by constituents who are not the intended beneficiaries of congressional action. With this in mind, the analysis examines whether HCFA responsiveness varied across constituents expected to “win” and “lose” under Medicare physician payment reform.

POLITICS AND PHYSICIAN PAYMENTS

The politics of physician payments have long been contentious (Marmor 1992; Smith 1992; Starr 1982). Payment issues played a major role in the passage of Medicare, as the American Medical Association (AMA) made its support contingent on a doctor-friendly reimbursement mechanism. The resulting “customary, prevailing, and reasonable” (CPR) system preserved physician autonomy by allowing doctors to set their fees and to bill the program accordingly. The system also produced a pair of negative effects. First, since physicians had an incentive to raise their fees continually, expenditures increased more rapidly than expected. From 1978 to 1987, for instance, payments to doctors grew at an annual rate of 16%, a rate unmatched in other sectors of the health economy (Kay 1990). Second, the CPR system produced an inequitable distribution of physician payments. Specialists such as cardiac surgeons had no incentive to reduce their fees when the costs of providing such services as open heart surgery diminished. Consequently, Medicare reimbursed these types of specialists more generously (relative to costs) than primary care practitioners (Jencks and Dobson 1985; U.S. Department of Health and Human Services 1989).

Elected officials continually took steps to slow the rate of growth in Medicare physician expenditures. President Nixon championed legislation that provided health care providers and beneficiaries with incentives to forsake traditional fee-for-service medicine in favor of prepaid group practices, such as health maintenance organizations. Congress passed an array of legislation, ranging from the creation of peer review organizations

(panels of physicians that evaluate the practice patterns of fellow doctors) to the imposition of a fifteen-month freeze on increases in physician fees.

Despite these piecemeal reforms, expenditures continued to rise at an alarmingly rapid rate, prompting Democrats and Republicans alike to press for fundamental restructuring in Medicare financing. In this regard, the Omnibus Budget Reconciliation Act (OBRA) of 1989 was landmark legislation, as it contained provisions mandating the development of a Medicare fee schedule. Under the fee schedule, payments for physician services were to be established in advance and to reflect physicians’ resource costs (i.e., the amount of work required to produce services, as well as practice and malpractice expenditures).⁴ The central objective of the fee schedule and related provisions was to limit the ability of doctors to set prices and, in the process, facilitate cost containment and cross-specialty redistribution of Medicare resources (U.S. Congress 1991; U.S. Department of Health and Human Services 1989).

Members of Congress delegated the task of establishing fees to HCFA, the agency that administers the Medicare program. This delegation placed enormous policymaking power in the hands of HCFA officials, as they possessed authority to set reimbursement rates for thousands of physician services covered by the program. Legislators sought to manage this delegation in a variety of ways. They created the Physician Payment Review Commission (PPRC), a congressional agency composed of prominent practitioners, academics, and health industry personnel. PPRC advised Congress on physician payment issues and monitored the development of the fee schedule. In addition, several health-oriented subcommittees conducted hearings on the fee schedule, both before and after passage of the enacting legislation (e.g., U.S. Congress 1988, 1991). These hearings assembled representatives from HCFA, organized medicine, and other interested parties and addressed a host of issues relevant to the setting of physician fees. Finally, and most important in the context of this article, legislators required HCFA to report payment levels in the *Federal Register*, in part to provide the physician community with opportunities to monitor and comment on the development of the fee schedule. With this mandate in mind, the agency published three notices: (1) a Model Fee Schedule on September 4, 1990, (2) a Proposed Rule on June 5, 1991, and (3) a Final Rule on November 25, 1991.⁵

⁴ A resource-based fee schedule was one of several options weighed during the 1980s. Other options included a charge-based fee schedule, whereby payments would be determined prospectively on the basis of physicians’ past charges, and a capitated system, whereby physicians would receive lump-sum payments to provide Medicare beneficiaries with all necessary medical care during a specified period. See Smith (1992, 136–58) for a discussion of why legislators ultimately pursued a fee schedule based on resource costs.

⁵ HCFA derived the payment levels reported in these notices from information provided by a variety of governmental and nongovernmental sources, most notably Harvard University’s School of Public Health (U.S. Department of Health and Human Services 1990, 1991a, 1991b). Harvard researchers produced three reports under a cooperative agreement with HCFA. The first report (from which the

Note: The numbers in the cells are counts of comments. I examined 5,471 of the approximately 95,000 comments submitted by individual practices in response to the Proposed Rule. HCFA stores these comments in numerous boxes. I randomly selected several boxes and collected information on all individual practice comments contained in these boxes. The 19 specialties listed here are a sample of prominent specialties affected by physician payment reform, selected to demonstrate cross-specialty variation in participation.

In accordance with APA requirements, HCFA solicited reactions from parties interested in Medicare payment policy. Given their large financial stake, physicians participated extensively during the sixty-day comment periods following publication of the Model Fee Schedule and Proposed Rule. Table 1 provides an overview of this participation. Physicians submitted 290 comments in response to the Model Fee Schedule. Professional associations such as the American Academy of Family Practitioners and American College of Surgeons accounted for 89 of these comments, with individual practices submitting the remainder. Physician participation increased dramatically after publication of the Proposed Rule. Professional associations nearly doubled their output, submitting 158 comments, while individual practices inundated the agency with

Model Fee Schedule was derived) presented extremely tentative values for about 1,000 services that accounted for approximately two-thirds of Medicare's physician expenditures. The second report (which influenced the development of the Proposed Rule) refined existing estimates and included preliminary values for about 3,000 additional services. The third report provided the values necessary to develop the Final Rule, which published binding levels for the full set of approximately 8,000 services.

approximately 95,000 comments. Participation also varied widely across specialties. Specialties such as radiology and internal medicine commented extensively, particularly in response to the Proposed Rule, there was relatively little participation by such specialties as thoracic surgery and pulmonary disease during both public comment periods.

With these patterns in mind, the analysis addresses two central questions: Did physician comments exert influence over the setting of Medicare fees? More specifically, did participation on the part of physicians expected to "win" under the fee schedule (e.g., primary care practitioners) affect HCFA decision making to a greater extent than participation by "losing" physicians (e.g., surgeons and other specialists)? The second question is particularly important in light of McNollgast's argument that administrative procedures serve the interests of legislators' favored constituents. Given that a primary goal of the fee schedule was to redistribute Medicare resources across specialties, a finding that HCFA officials were more responsive to primary care practitioners than to surgeons and other specialists would support the deck-stacking thesis. In contrast, a null finding would indicate that the notice and comment process did not operate as an instrument of political control in the manner posited by McNollgast.

VARIABLES AND METHODS

Dependent Variables

I assess the effect of physician participation by examining the extent to which comments prompted HCFA to change payment levels across *Federal Register* notices. The dependent variables are measures of change in specialty-level Medicare revenues. As Table 2 indicates, specialties fared quite differently during the rulemaking process. Cardiology and radiology, for example, experienced sizable revenue increases from the Proposed to Final Rule. In contrast, podiatry revenues decreased substantially across these notices.⁶

Table 2 presents an opportunity to discuss two important facets of the politics of Medicare reform. First, revenue changes were almost exclusively negative from the Model Fee Schedule to Proposed Rule and almost entirely positive from the Proposed to Final Rule. HCFA argued, on the basis of studies conducted by numerous researchers, that physicians performing services targeted for payment decreases would protect their Medicare revenues by increasing their volume of services (U.S. Department of Health and Human Services 1991a). The agency further argued that it had to incorporate this "behavioral offset" into its calculations in order to comply with a statutory mandate that the new payment system be

⁶ The unit of analysis is the physician specialty because comments typically addressed specialty-level, as opposed to procedure-level, issues. In addition, HCFA organized its payment-setting activities around specialties. Certain agency personnel, for example, were responsible for determining obstetrics/gynecology payments, while others focused on neurosurgery procedures.

Note: I calculated these changes in the following manner. I identified the set of procedures included in both the Model Fee Schedule and Proposed Rule (817), as well as those included in both the Proposed and Final Rules (3,377). For each specialty and *Federal Register* notice, I multiplied the reported payment for each of these procedures by the number of times that practitioners performed the procedure during 1991 and summed this product across procedures. These dollar amounts approximate the revenues that specialties would have derived from the Medicare program under each notice. Finally, I calculated differences in revenues across the Model Fee Schedule, Proposed Rule, and Final Rule.

budget neutral in its first year. As a result, HCFA imposed a substantial reduction in payments for procedures reported in the Proposed Rule (i.e., each payment was reduced by an equivalent percentage). This reduction explains why almost all specialties experienced negative revenue changes from the Model Fee Schedule to Proposed Rule.

The physician community objected vehemently to the behavioral offset. Specialties expected to fare poorly under the fee schedule argued that their payments were subject to two sets of reductions, one bringing payments more into line with resource costs and a second resulting from the offset. Winning specialties opposed the behavioral offset on the grounds that it erased a significant portion of their expected revenue gains (U.S. Congress 1991). Congress ultimately sided with the medical community and ordered HCFA to eliminate the behavioral offset almost completely from its calculations. As a result, payments for all procedures increased by an equivalent percentage from the Proposed to Final Rule. Although the inclusion and subsequent exclusion of the behavioral offset affected Medicare physician expenditures at the aggre-

gate level, they did not affect the extent to which the fee schedule redistributed resources across specialties.

The second feature of Table 2 that deserves mention is the fact that some winning specialties (e.g., family practice) experienced smaller revenue increases across the Proposed and Final Rules than certain expected losers (e.g., general surgery). Table 2 does not provide information about net wins and losses under the fee schedule. Rather, it tracks revenue changes across three stages of the rulemaking process. It is possible that although surgical and other specialties fared relatively well in this process, they nonetheless experienced reductions in Medicare payments under the fee schedule (e.g., the Model Fee Schedule may have reduced their payments by a large amount relative to the status quo, and, despite their success in the notice and comment process, their payments under the fee schedule were lower than under the status quo) and vice versa for primary care specialties. Information about the net effect of the fee schedule is not necessary in the context of this article, given its focus on the effect of the notice and comment process on agency decision making.

Explanatory Variables

To examine the efficacy of specialty participation, it is necessary to measure participation in the rulemaking process. I have chosen two measures, counts of comments submitted by professional associations (*Professional Association Comments*) and individual practices (*Individual Practice Comments*) in response to HCFA's preliminary regulations.⁷ Comments typically consisted of arguments and evidence designed to persuade the agency to increase specialty payments. As a result, a reasonable expectation is that participation exerted positive influence over revenue changes. This expectation, however, is tempered by previous empirical work. Magat, Krupnick, and Harrington (1986) find that, in general, industry participation did not influence EPA's setting of effluent standards under federal water pollution legislation.⁸ The lone exception occurred in the first of two comment periods, during which industry participation prompted EPA to relax proposed standards for a particular class of effluents. Magat, Krupnick, and Harrington (1986, 157) suggest that these results are consistent with the following account of participation:

⁷ The distinction between professional association and individual practice comments is blurred by the fact that practices often participated at the behest of associations. Many practice comments, for instance, were form letters that associations distributed to their members. Nevertheless, HCFA processed association and practice comments differently. It assigned a unique identification number to each association comment and stored them separately from practice comments. It is therefore appropriate to treat association and practice comments as distinct types of participation.

⁸ A major difference between my analysis and that of Magat, Krupnick, and Harrington (1986) is that I use information about actual comments, while they rely (of necessity) on EPA's published responses to categories of comments. Their null findings with respect to the efficacy of participation may reflect measurement error rather than EPA nonresponsiveness.

Comments in the . . . [initial] . . . period consisted of technical discussions and proposals that directly addressed the problem of drafting reasonable regulations, whereas in the period from proposal to final promulgation the commenters appeared to be focusing on legal questions in preparation for eventual litigation.

A finding that comments submitted between the Model Fee Schedule and Proposed Rule, but not the Proposed and Final Rule, influenced HCFA decision making would support the argument that early participation is more substantive and, hence, effective than that occurring later in the rulemaking process.

Given my focus on the deck-stacking thesis, it is essential to measure the extent to which specialties were the intended beneficiaries of the new payment system. Studies conducted prior to passage of OBRA by a variety of parties (e.g., AMA, HCFA, PPRC, Harvard University's School of Public Health) indicated that specialties such as thoracic surgery were likely to experience substantial reductions in Medicare revenues if payments were tied to resource costs.⁹ These studies also predicted that specialties such as family and general practice would experience sizable revenue increases under a resource-based fee schedule. Losing specialties typically were among those with the highest average per capita income, while winning specialties generally ranked among those with the lowest. With this in mind, I use *Income* as a measure of the extent to which specialties were the intended beneficiaries of the fee schedule (Pope and Schneider 1991).

Members of Congress were undoubtedly aware of the redistributive effect of the new payment system. At a March 17, 1989, hearing, health economist William C. Hsiao, one of the principal architects of the Harvard reports, testified that a resource-based fee schedule would result in payment increases for services provided by primary care and other low-income specialties and payment decreases for services provided by surgical and other high-income specialties (U.S. Congress 1989). His assessment was echoed at an April 20, 1989, hearing by representatives of specialties expected to fare well under the fee schedule (e.g., the American Academy of Family Practitioners), as well as representatives of losing specialties (e.g., the American Academy of Orthopaedic Surgeons) (U.S. Congress 1989).

Statements by members of Congress confirm that it is appropriate to consider low-income, but not high-income, specialties to be legislators' favored constituents. At a July 5, 1991, hearing, Senator Charles E. Grassley (R-IA), reacting hostilely to the Proposed Rule, made the following statement: "We believed, with everyone else, that the Medicare Physician Payment Reform was going to re-allocate money towards primary care practitioners" (U.S. Congress 1991, 6). Senator John D. Rockefeller (D-WV), a main proponent of reform, provided a similar account:

From the beginning, Congressional intent regarding this law has been very precise. The law was intended to establish a logical, rational method for reimbursing physi-

cians based on the resources required to carry out that service.

Certain procedures, particularly high-tech, invasive ones [i.e., those performed by high-income specialties] have traditionally been over-valued, while others that require the investment of time and are, perhaps, more cognitive in nature [i.e., those performed by low-income specialties], are under-valued. Congress clearly wanted a new payment system that understood those differences and would correct the distortions (U.S. Congress 1991, 2).¹⁰

The key explanatory variables are interactions of income and specialty participation (*Professional Association Comments * Income* and *Individual Practice Comments * Income*). These interactions provide insight into the relationship between legislative wins and losses and the efficacy of comments. A negative relationship between these variables and revenue changes would indicate that participation by low-income, or winning, specialties exerted greater influence over HCFA decision making than comments submitted by high-income, or losing, specialties. This result would indicate that the notice and comment process operated in a manner consistent with the deck-stacking thesis.

Factors other than specialty participation may have affected HCFA decision making. For example, I expect that HCFA was more likely to increase payments to specialties with large professional associations. These groups have the resources necessary to activate congressional fire alarms and mount court challenges, two unpleasant scenarios from the perspective of agency officials, who "prefer to maintain a fair degree of internal autonomy" (Ferejohn 1987, 442). I measure size as membership in a specialty's primary professional association (*Professional Association Membership*) (*Encyclopedia of Associations* 1991).¹¹

I also expect that HCFA was more likely to consider the preferences of specialties with greater *Financial Stake* in Medicare. Specialties that derive substantial revenue from the program (e.g., internal medicine and ophthalmology) would be more likely to notify Congress and the courts of their dissatisfaction with HCFA

¹⁰ Another reason that income is a valid proxy for legislative wins and losses is because it is distinct from Medicare revenues, which are a function of volume as well as fees. For instance, certain low-income specialties (e.g., general practice and internal medicine) encounter Medicare beneficiaries more frequently than some high-income specialties (e.g., otolaryngology and neurosurgery) and, therefore, derive greater revenue from the program.

¹¹ I use membership (more specifically, the log of membership) rather than budget because it is more readily available for many professional associations. This functional form implies that a percentage change in membership produces a unit change in revenues and takes into account the fact that specialties incur fixed costs when lobbying Congress and petitioning the courts. They must develop, for example, expertise regarding the resource costs of the services they provide, as well as the types of arguments and evidence that legislators and judges find persuasive. For smaller organizations, an increase of a given size may enable them to meet these costs and, as a result, substantially increase their influence in the notice and comment process. Larger groups may find that an equivalent increase in membership translates into a relatively small rise in influence, due to the fact that they have already met the fixed costs of participation.

⁹ The results of these studies are summarized in U.S. Department of Health and Human Services 1989.

decision making than those that generate relatively little revenue (e.g., infectious disease).¹²

Finally, professional associations vary in the extent to which they can credibly claim to represent a wide range of professional interests. In 1990, for example, membership in the American College of Radiology exceeded the population of radiologists by more than 10,000, while membership in the American Urology Association fell well short of the number of urologists. I expect that HCFA was more likely to increase fees for specialties with more representative organizations, as these types of groups have historically wielded greater influence over health policy than those with narrower constituencies (Rayack 1967; Starr 1982). I measure *Representativeness of Professional Association* as professional association membership divided by specialty population (Roback, Randolph, and Seidman 1992; U.S. Department of Health and Human Services 1993; U.S. Department of Labor 1994).

Methods

The most straightforward way to determine the influence of the explanatory variables on the setting of fees is through ordinary least squares (OLS) regression. This approach is potentially problematic, as the decisions of professional associations and individual practices to comment on the Model Fee Schedule and Proposed Rule may have been endogenous. Participation, for example, may have been a function of expected wins and losses, with losing specialties being more likely to comment than those expecting increases in Medicare revenues. This pattern would be consistent with Schattschneider's (1960, 39) observation, echoed by a wide array of scholars, that it is losers in policy battles "*who seek redress from public authority*." One implication of endogeneity is that the estimated effects of participation may be negative and significant when, in fact, comments exerted substantial positive influence over revenues changes (i.e., losing specialties would have experienced larger revenue decreases had they not participated extensively, and winners would have enhanced their gains had they submitted additional comments).

Despite this possibility, I do not model participation as endogenous because of the following methodological complications. First, the participation variables consist of counts of comments. As a result, equations examining the determinants of participation must be estimated through event count regression (e.g., Poisson, negative binomial) (King 1988, 1989). Second, the interactions of participation and income must also be modeled as endogenous. Together these econometric dictates imply the following system of equations: two first-stage equations, one of which is an event count, and a second-stage OLS equation. I am aware of no

technique that facilitates estimation of such a system while making the necessary correction in second-stage standard errors (Gujarati 1995). With this in mind, I assume that physician participation is not endogenous, an assumption that increases the uncertainty attached to the standard errors and significance tests. The OLS results must therefore be interpreted with appropriate caution.

An additional methodological issue—heteroskedasticity—requires attention. Heteroskedasticity may arise because the unit of analysis is the physician specialty. Specialties vary widely in both size and stake in the Medicare program, a fact that may be reflected in greater error term variance for larger specialties and those with greater stake. As a result, I use White's (1980) covariance matrix estimator to calculate the standard errors.

RESULTS

Tables 3 and 4 present the results. Each table contains two equations, one in which participation is measured as the number of comments submitted by professional associations and one in which participation is measured by the number of comments submitted by individual practices. Table 3 focuses on the determinants of revenue changes across the Model Fee Schedule and Proposed Rule. None of the explanatory variables exert their expected influence. The fact that comments submitted early in the rulemaking process were ineffectual contradicts Magat, Krupnick, and Harrington's (1986) suggestion that early participation—unlike later, politically motivated participation—provides regulators with substantive information. This null finding, however, may be a reflection not of the nature of physician participation but of the way in which HCFA managed its authority. The Model Fee Schedule did not include the vast majority of Medicare services and, therefore, provided specialties with limited information about the likely effects of the fee schedule. In addition, the agency emphasized that this notice was extremely tentative and potentially subject to dramatic change, in part due to anticipated improvements in data quality (e.g., forthcoming Harvard reports). Finally, HCFA announced that it would not reply to comments submitted prior to the Proposed Rule: "If you wish to have your comments formally considered, they must be submitted to us in response to the proposed rule in accordance with the instructions specified in that rule" (U.S. Department of Health and Human Services 1990, 36178). By manipulating these facets of its procedural environment, the agency may have provided itself with an opportunity to operate relatively autonomously during the early stages of the development of the fee schedule.

Table 3 indicates that HCFA was not more responsive to comments submitted by low-income specialties than to comments submitted by high-income specialties. These results imply that legislators' favored constituents did not benefit disproportionately from the initial comment period. This stage of the notice and comment process, in other words, did not operate as an

Likewise, I measure stake as the log of Proposed Rule revenues when focusing on Proposed to Final Rule changes. These measures capture specialty stake in the *Federal Register* notice directly preceding the comment period under consideration.

instrument of political control in the manner posited by the deck-stacking thesis.

Table 4 provides evidence that comments submitted after the Proposed Rule exerted mixed influence over HCFA decision making. The null parameter estimates attached to the participation variables mirror the results generated by Magat, Krupnick, and Harrington (1986, 143), who point out that such findings raise "serious questions about the responsiveness of the process." The efficacy of participation, however, varied across specialties. The coefficients for both interaction variables are positive and significant, indicating that comments submitted by high-income specialties exerted greater influence than comments submitted by low-income specialties. In other words, high-income specialists expected to experience revenue decreases under a resource-based fee schedule derived greater benefits from this stage of the notice and comment process than legislators' favored constituents (low-income specialists). This finding, together with the results presented in Table 3, demonstrates that neither comment period facilitated political control of HCFA decision making in the manner posited by the deck-stacking thesis.

schedule influenced HCFA decision making; agency officials were more responsive to specialties that derive substantial revenue from the Medicare program. In addition, there is modest evidence that HCFA was more responsive to specialties with large professional associations. This variable's estimate is positive and nearly significant ($p = .09$) in the equation measuring participation as the number of comments submitted by individual practices. This result suggests that while professional associations' letter-writing campaigns were of limited utility (i.e., the number of individual practice comments did not affect revenue changes), HCFA officials nevertheless considered organizational resources when setting fees.

CONCLUSION

This article has demonstrated that physician participation in the notice and comment process did not influence Medicare physician payment reform in the manner posited by the deck-stacking thesis. HCFA was not more responsive to comments submitted by low-income specialties after publication of the Model Fee

Schedule than to those submitted by high-income specialties. In addition, the agency was more responsive to comments submitted by high-income specialties after publication of the Proposed Rule than to those submitted by low-income specialties. Given that the latter were the intended beneficiaries of the redistributive component of the fee schedule, this finding implies that the notice and comment process did not facilitate political control by channeling HCFA's decisions "toward the substantive outcomes that are most favored by those who are intended to be benefitted by the policy" (McNollgast 1987, 244).

As McNollgast (1987) point out, legislators can stack agency decks in a variety of ways. One example is burden-of-proof standards. Prior to 1978, the Civil Aeronautics Board (CAB) required airlines proposing price changes to demonstrate the appropriateness of requested rates. After passage of the Airline Deregulation Act, the burden of proof shifted to carriers seeking to block prospective fare hikes or reductions. Not surprisingly, CAB more readily approved airline requests in the aftermath of this procedural change. As this case illustrates, burden of proof operates in a manner that makes it difficult for constituents excluded from congressional bargains to secure policy advantages at the expense of legislators' favored constituents.

More generally, Spence (1997, 205) makes a distinction between procedures that "increase the transaction costs of agency decision making" and those that increase the "costs of making a *particular* decision." The notice and comment process falls into the former category; while it facilitates external participation in rulemaking, it does not, in and of itself, direct agencies toward specific policy choices. Spence (1996) provides empirical evidence for this distinction in the context of hydroelectric licensing. The Federal Energy Regulatory Commission (FERC) did not become more responsive to environmental interests in the aftermath of a mandate to consider the environmental effects of proposed projects. The environmental content of FERC decisions changed only after Congress required the agency "to accept any license conditions proposed by state or federal environmental or resource agencies, or to provide a written explanation of the reasons why the proposed conditions were rejected" (Spence 1996, 8). These findings suggest that administrative procedures vary in the extent to which they predispose agencies toward particular policy choices and, ultimately, serve as instruments of political control.

Why would members of Congress select administrative procedures that limit their ability to stack agency decks? As Hill and Brazier (1991) point out, legislative outcomes vary in the extent to which they resolve differences among competing constituencies. The Clean Air Act Amendments of 1977, for example, did not fully reconcile the divergent preferences of industrial and environmental interests. The act's procedural requirements, therefore, ensured that both parties had access to EPA without stacking the deck in favor of the economy or environment. Hill and Brazier (1991, 398) argue that since legislative bargains are frequently fraught with these types of ambiguities, "the conditions

conducive to this ex ante control [i.e., deck-stacking on behalf of legislators' favored constituents] cannot be expected to exist generally, and ex ante controls seem easily undermined by a large variety of commonly found situations."

Despite appearances to the contrary, payment levels promulgated in the Final Rule may have been consistent with congressional preferences. Legislators may have anticipated that HCFA officials would be more responsive to high-income specialties and, as a result, mandated the development of a fee schedule that was more redistributive than that preferred by the median member. Furthermore, members of Congress may have been content with the discretion exercised by HCFA. As Bawn (1995, 63) points out, the "problem is that administrative procedures designed to prevent bureaucratic drift also limit the agency's ability to research policy consequences or to make decisions that reflect its expertise." Given the technical nature of Medicare reform, legislators may have been willing to trade strict control over redistribution for accurate information about physicians' resource costs. Finally, members of Congress, as discussed earlier, monitored HCFA decision making through instruments other than the notice and comment process. These activities (e.g., creating PPRC and conducting oversight hearings) may have effectively protected the bargain struck in Congress.

In sum, this article does not demonstrate that HCFA enjoyed autonomy in the setting of physician fees or, more generally, that Congress exerts little control over the bureaucracy. Rather, it demonstrates that a prominent administrative procedure does not necessarily promote agency policy choices that serve the interests of legislators' favored constituents. This finding is important because of the attention that the deck-stacking thesis has received since the seminal work of McNollgast. It also suggests, in tandem with previous empirical results, that elected officials may most effectively constrain bureaucratic discretion through mechanisms such as personnel decisions, budgetary manipulations, and procedures that predispose agencies toward particular policy choices. Given the widespread use of the notice and comment process in contemporary American politics (Kerwin 1994), legislative bargains may unravel within a wide range of policy areas and agencies.

BOOK REVIEWS

Political Theory

Freedom and Culture in Western Society. By Hans Blokland.
New York: Routledge, 1997. 319p. \$74.95.

Brent L. Pickett, *Chadron State College*

Hans Blokland revisits the debate between positive and negative freedom. He seeks to defend a chastened version of positive freedom, one which emphasizes personal autonomy. While he defends the worth of a large scope for negative freedom, Blokland ultimately believes that a positive or exercise-concept of freedom can be made largely compatible with negative liberty. Furthermore, he argues that through an active arts and culture policy the state has a significant role to play in the promotion of autonomy.

Blokland displays a strong grasp of the voluminous literature on the debate over freedom, especially the debate in the Anglo-American tradition. It seems as if virtually no Anglo-American theorist writing about freedom in the last 30 years has escaped his attention (though remarkably enough there is no mention of Richard Flathman's *The Philosophy and Politics of Freedom* [1987]). Indeed, at times his focus is too much upon contemporary works; the only pre-twentieth century thinker to make a real appearance in this work is J. S. Mill. Blokland focuses much of his attention upon Isaiah Berlin, devoting a chapter to a careful explication and criticism of Berlin's "Two Concepts of Liberty" and other writings on freedom. This is appropriate not only because of the preeminence of Berlin's work in this area but also because Blokland's approach closely resembles that of Berlin. Both are ethical pluralists who are willing to admit that at least certain forms of negative and positive freedom are genuinely valuable; they simply disagree about where the tradeoffs actually lie.

Admitting that both negative and positive freedom are real goods opens up what Blokland calls an *emancipation dilemma*, which has two dimensions, one individual and the other social. On the one hand, Blokland favors an active cultural dissemination policy, since he believes this will help develop capacities essential to autonomy, such as the ability to reflect critically upon the society one inhabits. On the other hand, Blokland recognizes that such a policy can be coercive, especially for those adults who lack autonomy and do not see it as a good. Is paternalism toward such individuals justifiable? If contemporary society inculcates undesirable attitudes and modes of life, such as a shallow materialism, then how can society be systematically reorganized to eliminate these tendencies, while still recognizing a large degree of negative freedom? Blokland's goal is to articulate a conception of autonomy which is compelling to a wide range of theorists and "which makes it possible to break out of the dilemma... in a manner acceptable to the parties concerned" (p. 6). In his discussions of positive freedom and autonomy, Blokland does much to clarify a rather disparate debate. In effect, he conducts a survey of recent positive freedom theorists, such as Charles Taylor and Benjamin Barber, in order to sort out what is essential to theories of positive freedom. The ideal of autonomy at which Blokland arrives is rather demanding. Autonomy requires "a balanced, integrated personality," along with self-knowledge, will power, some independence of mind, and an "active theoretical rationality" (pp. 81, 82). Yet, because this conception is demanding, it is doubtful whether it will persuade a wide range of theorists, as Blokland uses this conception to defend paternalism, in the hope that a temporary interference in a

person's life may, in the long run, greatly expand her number of meaningful choices.

Blokland also thinks paternalism is "sometimes inevitable... in order to break up existing structures of socialization or a prevailing inertia" (p. 157). That is, in the social dimension of the emancipation dilemma Blokland again supports active intervention in order to foster the capacities necessary for autonomy. He realizes this opens him to various charges of recommending coercion, such as Berlin made, yet Blokland contends that "it is undesirable that people, out of fear of the accusation of totalitarian thinking, leave cultural formation as a matter of course to the 'free play of social, in this case economic, forces,' and not to democratically accountable institutions such as government, parliament, political parties, educational institutions and the press" (p. 185). Though one can certainly wonder just how democratically accountable these latter institutions are, there are good reasons for not leaving socialization up to market forces. Since participation in culture often has the effect of opening persons up to alternative ways of living, encouraging critical reflection upon one's society and its norms, and aiding the development of the capacities necessary for autonomy, Blokland argues for a greater social commitment to the arts and culture. Western societies have made the mistake of pursuing only a supply-oriented culture policy; that is, subsidizing theaters, libraries, and so on, in the hope that people will attend. He provides evidence, however, that participation in culture is lacking especially among the poor, and that cultural activity is declining in general among all groups. Thus, Blokland believes that governments in particular need to do more to increase the demand side in their cultural policies; for example, through altering school curriculums to give the arts and culture a greater emphasis, and by subsidizing more amateur art performances.

Because Blokland combines an extensive literature review with his own valuable analysis, this book is of great value to those interested in theories of freedom. Yet, it should have an even wider appeal: The manner in which he connects abstract issues about human nature and the nature of freedom with issues of cultural policy is powerful and well argued. This book has a great number of virtues: a wealth of interesting asides about variation between countries in cultural policies; a discussion of the effects of moving from an oral to a written culture, and now to a visual (electronic) one; and too many other topics to mention. Even though the translation is sometimes awkward, this book deserves a large audience.

Skepticism, Belief, and the Modern: Maimonides to Nietzsche. By Aryeh Botwinick. Ithaca, NY, and London: Cornell University Press, 1997. 249p. \$39.95.

Fredrick Appel, *Harvard University*

Aryeh Botwinick is nothing if not ambitious. In this provocative and occasionally insightful book he proposes nothing less than a rereading of Western intellectual history as the progressive triumph of skepticism. The general idea is that skepticism, the view that "our theoretical formulations do not necessarily intersect with a reality outside themselves" (p. 18), initially presented itself in an inchoate and unself-conscious form in antiquity and the Middle Ages before gradually emerging in modernity and postmodernity as a more mature (i.e., more self-conscious and self-confident) mode of being in the world.

Although Plato makes a (surprising) cameo appearance as a posterboy for premodern skepticism, Botwinick places the

twelfth-century Jewish philosopher Maimonides center stage as the exemplary premodern thinker who placed skepticism on its road to triumph. In the course of his "negative theology," Maimonides dismisses popular, literal accounts of God as mere linguistic constructions that have no basis in reality. This insight is said to have opened the door for more mature forms of skepticism to expose linguistic constructivism as an exercise that "may proceed to infinity" (p. 30). Botwinick argues that Thomas Hobbes appropriates key Maimonidean motifs, thereby extending the scope and power of skeptical doctrine. Finally, skepticism as a mode of being emerges in its fully developed form in Friedrich Nietzsche, who is portrayed as both the quintessential modern thinker and as an early exemplar of postmodernism, "modernity's most elevated moment of reflectiveness and self-consciousness" (p. 9).

There is much to admire in this learned book, particularly in the sections on Maimonides and Hobbes. Botwinick points to some clear and important parallels between the austere monotheism of Maimonides and the account of God in the second half of Hobbes's *Leviathan*. Even if Maimonides were not a direct formative influence on Hobbes, Botwinick is right that something like the Maimonidean vision informs Hobbes's account. In light of Hobbes's well-known assessment of the dangers of allowing nonstate actors to proclaim themselves religious authorities with privileged knowledge of the Deity, it is understandable why he would be attracted to something like the Maimonidean notion of a wholly inscrutable God.

Unfortunately, Botwinick's efforts to make each of his featured thinkers fit into his metathesis lead to some highly problematic interpretations. While it is true that Maimonides sometimes seems to adopt the perspective of a "field anthropologist" vis-à-vis Jewish ritual practices (p. 133), describing them functionally rather than in terms of their truth value, Botwinick goes too far in asserting that *The Guide of the Perplexed* points ultimately to the "foundationless character of all our knowledge claims" (p. 32; cf. 41). Although Maimonides was at pains to stress the limits of reason, he also insisted upon the possibility of apprehending things outside the mind (*Guide of the Perplexed*, I, chap. 50). Botwinick seems aware of this at times; for example, he notes that for Maimonides "only the solitary thinker has an opportunity to approach the limits of knowledge and of truth" (p. 149). But he then suggests, strangely, that the truths attained by these scholars are strictly "private" (*ibid.*).

Botwinick is certainly on solid ground in making the case for Hobbes's moral skepticism. Once again, however, he strains credulity by asserting that it is so thorough-going that it leads us to bypass altogether any reference to an external reality (pp. 5, 152). Far from presenting his views as a closed system, Hobbes insists upon the existence of at least a few cross-culturally valid facts (e.g., our striving for self-preservation, our valuing existence as good) that a modern political science can unearth. (Botwinick notes Hobbes's admiration for modern science in passing, without reflecting on the difficulty this creates for his thesis.)

The view that Nietzsche "attempts to evolve a philosophical discourse situated beyond preoccupation with truth" (p. 1) has been standard in Nietzsche scholarship until the last decade. Unfortunately, Botwinick shows no sign of having considered more recent work (by, for example, Maudemarie Clark, John Richardson, and Peter Berkowitz) which marshals impressive textual evidence that demonstrates (to my mind, at least) Nietzsche's abiding interest in truth. If this recent scholarship has any bite, the central question of Botwinick's Nietzsche chapter—does Nietzsche successfully

come up with a strategy for salvaging his extreme skepticism and relativism?—loses its dramatic force.

Botwinick's metathesis might (possibly) be of concern to philosophers interested in epistemology, but why should political theorists care about this book? The author assures us that the story of skepticism's triumph has salutary political consequences: Skepticism, we are informed, provides strong support for both liberalism and participatory democracy. If all arguments about reality are indeed circular, then this fact necessarily "undercuts the claims of particular individuals or groups to superior knowledge" and "justifies the inclusion of as many people as possible in public decision making" (p. 7). Moreover, the "most coherent reading" of liberalism reveals it to be "grounded in skepticism" (p. 6). I am not so sure, however, that the flourishing of liberal democracy is as dependent upon the veracity of Botwinick's metathesis as the author thinks. Although much contemporary political theory suggests otherwise, the idea that epistemology drives politics is not self-evident. It seems to me that a given epistemological stance can lead to a bewildering variety of political stances. The political credentials of skepticism, in other words, remain an open question.

Even if Botwinick's enthusiasm for his metanarrative has led him into such misreadings, this fact alone does not disprove his story. Realist conceptions of truth are taking a beating from all sides in the academy these days: Mainstream analytic philosophers such as Michael Dummett and Crispin Wright are in the antirealist camp, and of course antirealism is a staple of postmodern writing inspired by Foucault, Deleuze, and Derrida. So Botwinick can count on a lot of support. Yet, the possibility of a strongly realistic conception of truth should not be discounted. Contemporary philosophers such as Alasdair MacIntyre, Martha Nussbaum, and Charles Taylor agree that we must discount naïve positivism without following Botwinick to the conclusion that our language games are entirely self-enclosed (p. 83). The debate between realists and antirealists is far from over; as Botwinick himself concedes, "the returns are not yet in" (p. 18). As the debate unfolds, Botwinick's metathesis must be taken seriously as a contender. Hence, for all its flaws, the book is important.

Hannah Arendt and the Meaning of Politics. Edited by Craig Calhoun and John McGowan. Afterword by Martin Jay. Minneapolis and London: University of Minnesota Press, 1997. 376p. \$54.95 cloth, \$21.95 paper.

Phillip Hansen, *University of Regina*

This fine collection of essays, prepared originally for a conference at the University of North Carolina at Chapel Hill in 1995, makes a valuable contribution to the continuing debate about the meaning and significance of Hannah Arendt's political thought. Largely eschewing exegesis, the authors attempt to think creatively with and against Arendt in the quest for "a political theory that gives a richer meaning to the idea of politics than has seemed common in recent years" (p. 2). In line with current preoccupations in political thinking, the book focuses on what might broadly be called the aesthetic dimension of Arendt's work. It devotes considerable attention to the roles that judgment and public space play in her thought; as a result, the differences between so-called postmodernist and Habermasian interpreters figure prominently throughout. The arguments of the papers are developed against the backdrop of the complex relation of Arendt's ideas to the modern age, the legacy of enlightenment, and especially the consequences of totalitarianism.

Reflecting the view that a conference is itself an action in public space, the book is structured as a dialogue among the participants. The papers written by Susan Bickford, Nancy Fraser, Craig Calhoun, and Stephen T. Leonard are direct responses to those of the other authors, while Martin Jay provides a perspective on the conference as a whole. For a work of this kind, the essays are of a uniformly high quality. Not all are, to this reviewer, equally compelling. Those by Leonard and by Anthony J. Cascardi seem to misconceive important dimensions of Arendt's ideas, while Cascardi and Dana Villa overplay the "agonistic" character of Arendt's notion of public space, forgetting that for Arendt political action ought to be properly bounded by the requirements of power and thus a certain sort of solidarity. But all are well written and thoughtful.

The book offers insights into the phenomenology of political experience, the ways in which politics can be personally meaningful in the face of current predicaments, and it shows how Arendt's ideas contribute to the kind of understanding required. This is the book's strength, but it is also its weakness. There is today a tendency (to which this reviewer has also contributed) to emphasize the micropolitics of experience, to the exclusion of macropolitical questions that involve confronting issues of history and social structure, as Arendt herself often did. For a variety of reasons, not least the assumption that actually existing liberal democracy is the best we can do, much recent political thought has failed to confront the question of how to relate micropolitical to macropolitical concerns.

Not every essay in this collection ignores this admittedly complex problem. Leonard's argument assumes the need to face it, while Lisa Disch provides an imaginative attempt to relate Arendt's perspectival account of judging to the 1970s experience of feminist consciousness raising, with a view to institutionalizing a "cubist" public sphere adequate to the pluralist character of contemporary societies. And both Eli Zaretsky and Nancy Fraser, the one explicitly, the other implicitly, remind us that Arendt's political thought emerged in large part as a dialogue with Marx; Fraser is particularly good in sharply criticizing the proclivity to overburden normatively Arendt's notion of action, to the exclusion of considerations of justice and equality, a proclivity Arendt herself abets. These latter pieces suggest that political theory must become reacquainted with political economy if it is to address meaningfully contemporary political questions.

In light of these considerations, the essay by Richard J. Bernstein on the relations among thinking, judging, and evil stands out. It is not the best essay—that honor falls to Kirstie McClure's splendid exploration of the complexities of Arendtian judgment—but it is in a sense the most representative. After carefully discussing Arendt's account of Adolf Eichmann, and the problem of evil and complicity with it, Bernstein argues that Arendt does not, and perhaps cannot, tell us how to distinguish between those who in the face of moral collapse can still judge and follow their conscience and those who, like Eichmann, either lost this ability or never had it. In Bernstein's view, this reveals a contradiction in Arendt's thought: While "Arendt herself was critical of what she once called 'the optimistic view of human nature', which presupposes 'an independent human faculty... which judges anew and in full spontaneity every deed and intent'... ironically it is Arendt herself who seems to *want to believe* that there is such a human faculty... the faculty of judgment" (p. 318). As Bernstein sees it, she has no way of reconciling these positions, and this suggests a terrible and unresolvable human dilemma.

This contradiction is posed too sharply, however, because

it is too wrapped up with the micropolitics of personal judging. In *The Origins of Totalitarianism* (3d ed., 1973), Arendt argued that totalitarianism and thus the moral collapse it brought with it fed upon loneliness and isolation, themselves the products at least in part of human misery and material deprivation. In other words, there are conditions under which at least the possibilities for judging can be more fully secured, as opposed to those conditions under which it is more likely to be suppressed. Such conditions are alterable and involve changes in social structure—and this in spite of Arendt's well-known (and overly exaggerated) hostility to the "social" as well as her tendency in her late work on judging to overlook her own earlier argument. More decent socioeconomic and political conditions provide, of course, no guarantee against unconscionable behavior; nothing can. But they do call for a more nuanced account of human capabilities. Our encounters with the challenges, problems, and dilemmas of politics are not as starkly "existential" as Bernstein's account, and many of the essays in this book, imply.

One thing clearly emerges from this thought-provoking collection: After twenty years of intensive examination, Hannah Arendt's political ideas continue to challenge and provoke—and, on occasion, to frustrate as well.

Nietzsche's Dangerous Game: Philosophy in the Twilight of the Idols. By Daniel W. Conway. Cambridge: Cambridge University Press, 1997. 267p. \$54.95.

Tracy B. Strong, *University of California, San Diego*

Daniel Conway has written an important book focusing on what he calls Nietzsche's "mature political thinking" (p. 1). He identifies this as the work Nietzsche completed after the fourth part of *Thus Spoke Zarathustra* (1885) and the onset of his insanity in early 1889. That Conway can speak of Nietzsche's "mature" political writing is a sign of how far Nietzsche studies have come in the last quarter-century. The question used to be whether he had any political thinking worth paying attention to at all.

The dynamic premise of this book is that Nietzsche knew himself to be implicated in and to exemplify the cultural crisis of modernity. Nietzsche's name for this crisis is "decadence," which Conway reads as a mis- or inappropriate matching of instincts to life—a kind of collective neurosis and/or psychosis whereby a culture consistently makes choices harmful to its health. Conway spends a strong chapter arguing that Nietzsche intended this diagnosis as empirical; I think him right about Nietzsche's intention here (and a good deal of recent work on Nietzsche—by such authors as Keith Ansell-Pearson, Babette Babich, Mark Warren, and David Owen—provides additional support for versions of this claim).

If Nietzsche is indeed writing about existing historical conditions, then his political philosophy will of necessity exemplify at least some of the problems identified. How could any project of cultural revolution not make the situation worse? And this in turn implies, as Conway argues, that as an author Nietzsche will not be able to control the understandings given to and uses made of his work. (This is the situation that precipitates Zarathustra's departure from the marketplace at the beginning of the work that bears his name.)

Zarathustra's failure in the marketplace thus precipitates in Nietzsche a new approach, which Conway holds to be characteristic of the work of the last period of his life. In his attempt to deal with the problem of his own involvement in that of which he is critical, Nietzsche develops a number of rhetorical strategies. Conway analyzes these under the term

parastrategesis, which designates "those rhetorical strategies that [Nietzsche] intentionally crafts to exceed the sphere of his own authorial control. . . . [It] constitutes an arena of dialectical contest within which the decadent Nietzsche is forced to confront his most independent readers" (pp. 153–4). (I should note that part of the richness of the book is a discussion of Nietzsche's philosophy as a kind satyr playing with its audience).

Nietzsche's project is thus political in two senses. First, it is Nietzsche's intention to found "communities of resistance" (p. 95) to the condition of modernity. Second, such communities will be of a nonliberal politics in that they will be composed of those who would find themselves in resistance in general, rather than in particular, to the society of which they are members. Such politics will not address specific problems but society as a whole (on this last point I may be reading something into Conway, but it is, I think, implied). Conway notes (as have some others, including this reviewer) that by fall 1888 Nietzsche was willing to accept for himself the designation of a political lawgiver. The claim here is that Nietzsche's assumption of a political stance corresponds to his having finally accomplished and embodied the full critique of Christianity. For Nietzsche, Christianity is the source and cause of the political ills of the modern world.

From whence the Anti-Christ, now seen as a necessary political figure? Nietzsche, for Conway, wants to turn his readers (his perfect readers) into his agonistic enemies, to embody himself in them as the opponents of Christianity. Parastrategesis is the "dangerous game" of Conway's title. For this strategy to work, however, Nietzsche would have to have as perfect knowledge of himself as he hoped for in his readers. Conway scatters the book with references to Nietzsche's "unconscious prejudices" (p. 16) and "unwitting" self-presentations (p. 131). In the end, Nietzsche "did not possess sufficient self-knowledge to close the circle of his thought and complete his critical project" (p. 248). Conway illustrates this with an extremely interesting reading of Nietzsche's *The Antichrist* (or *The Antichristian*, the German can mean both), a reading all the stronger for showing why most readers have tended to pass over this book as an embarrassment in Nietzsche's corpus.

What, then, is Nietzsche's accomplishment, if we accept that his project fails and must fail? For Conway, Nietzsche provides us in his own example with "a representative type of life that faithfully express the fractured ethos of the age. . . . Owning to his unique destiny as a representative exemplar of late modernity, he accommodates within his tortured soul the riddles and tensions that define his age" (pp. 233–4). Conway concludes, however, that his "actual readers" are only pale reflections of his would-be exemplars, "nook-swelling creatures of *ressentiment*, versed in the 'effeminate' arts of subterfuge, duplicity and deception, . . . treacherous followers who will betray him and distort his own teachings to suit their own designs" (p. 255).

I do not know exactly whom Conway has in mind as the membership of this last inadequate group. His footnotes are a model of learning and kindness; he wears them lightly and covers most of the important (and less important) scholars. But beyond naming names, there is an important point here: Nietzsche has the quality of lending himself to promiscuous and self-serving appropriation. I am not as sure as is Conway that this is a bad thing; at least I do not think that the matter can stop there. In my experience, Nietzsche writes not only in such a way that it is inevitable he be misunderstood but also with the knowledge that being misunderstood is a necessary part of being understood. For example, we all know that Nietzsche says "whatever does not kill me makes me stron-

ger." *Conan the Barbarian* and Gold's Gym are not the first appropriations. But Nietzsche is quoted out of context. In *Twilight of the Idols*, a book that is to be a "declaration of war" but also a "wounding" of himself, he writes: "*From the military school of life*: whatever does not kill me makes me stronger." So part of our understanding of this aphorism has to do with why we want to misremember it. And, presumably, understanding why we want to misremember will tell us something about the kinds of things from which we feel the need to protect ourselves. We will have to think about our thinking.

Conway has written an excellent and thoughtful book. The difference between him and me has to do with the possibility of writing political theory in and for the modern age. If Nietzsche cannot be avoided—a claim in itself, but one which I think true—then Conway shows us that political theory is in fact impossible; it will be only ideology or neurosis. If what I say about Nietzsche's texts is true, then they have the quality of not allowing us to spare ourselves from thinking, and that may be more than just a start to political theory.

Ways of War and Peace: Realism, Liberalism, and Socialism.

By Michael W. Doyle. New York: W. W. Norton, 1997. 557p. \$30.00.

Steven Forde, *University of North Texas*

This lengthy tome undertakes a truly ambitious project, mining the thought of the past two millennia for guidance on how to approach the challenges of international politics today. Michael Doyle structures his account around the three outlooks that have dominated international thought during the twentieth century: realism, liberalism, and Marxism or socialism. Each of these outlooks has older roots, and Doyle explores them at length. Large portions of his book are devoted to treatments of Thucydides, Kant, Marx, Rousseau, Schumpeter, and a host of other writers who contributed to the development of the three paradigms. These writers are often treated perfunctorily in books on international politics, if they are treated at all, but Doyle's discussions are thorough and nuanced. Specialists on each of the authors may quarrel with details of the exposition, but very few will be well enough versed in all the thinkers to play the critic. In that respect, the book is encyclopedic in its range.

The range is impressive, but it creates some problems as well. Some readers may complain that the book lacks a clear thesis or agenda, a criticism that receives some justification from the far-flung and diffuse nature of the work. The same qualities sometimes make the thread of the argument hard to follow and, occasionally, lead the author into redundancies. It is also true that, by dint of giving every thinker and every perspective a sympathetic hearing, Doyle sometimes leaves it unclear where he stands. This I do not regard as a vice, though it does lead to occasional confusion as to what Doyle is saying in his own voice.

The aim of the book is not merely to interpret theorists but to move beyond this and bring the insights of these traditions to bear on some of the hard problems faced by states and statesmen today. Woven in with the theoretical expositions are sometimes extensive discussions of historical and contemporary events. These are examined with a view to the light that each of the three fundamental theories can cast on them—and vice versa. One of the most interesting aspects of this book is its sustained attempt to use historical and contemporary case studies to test the theories. As Doyle points out, the lack of such testing is a shortcoming of much current literature, in which the underlying theories of real-

ism, liberalism, or socialism often appear as mere assumptions. In the separate sections of the work devoted to each of the fundamental theories, Doyle undertakes both to explore the theory in question and to test it. Thus, under "realism," he identifies structuralist, fundamentalist, and constitutionalist variants of the theory and explores the classical and contemporary authors who have shaped them. He then uses the case of the (shifting) balance of power in eighteenth-century Europe to test which of these variants best explains events (the constitutionalist model, emphasizing domestic political arrangements, seems to be the winner: p. 192).

In the course of the book, Doyle makes many arguments that should materially improve the state of the discussion in international theory. He shows how Machiavelli's fundamentalist theory is more consistent (and thus more instructive) than most versions that have followed it. He argues that Hobbes's structuralism is superior to more modern variants in that it is not purely structural: Anarchy leads to conflict only given certain suppositions about human nature. Doyle's discussion of Kant and the liberal paradigm sheds light on the "democratic peace." As scholars have come to realize, this phenomenon would be better labeled the "liberal peace," as Kant would have preferred. Doyle shows that "liberalism" must be even further refined and restricted to vindicate the hypothesis. Thucydides' Athens and Machiavelli's Rome were characterized by "liberty" but were far from pacific. It is only distinctly modern liberty, universalist and nondiscriminatory, that makes liberal regimes peaceful (p. 306). When discussing the socialist tradition, Doyle outlines important differences between Marx and Lenin regarding their theories of international politics and imperialism, and he locates their thought firmly within the historical context that shaped them. In one indirect test, Lenin's theory does not fare well (p. 359), but Doyle exonerates the socialist movement as a whole from the charge that individual parties' support for war in 1914 was a betrayal or refutation of their professed internationalism (pp. 368–77). He argues that the prudential component allowed for in Marxist international thought can explain the parties' behavior.

The final sections of the book bring the three traditions to bear on some of the tough ethical and practical issues of international politics today. Doyle explains how realism, liberalism, and socialism would each approach the issues of intervention and of international (re)distribution of wealth, and how they might see the future of the international system. Policymakers' responses to each of these challenges will depend decisively upon which perspective is taken, so Doyle's effort to trace the practical implications of each of the theories in this matter is a real public service. The centerpiece of his treatment of intervention is a discussion of the "hard case" of U.S. intervention in Grenada. He finds the intervention ethically justifiable despite its violation of international law. Its justification, though, is not the one that (he finds) motivated President Reagan, but rather the principle of Grenadan self-determination. In the matter of the international distribution of wealth, Doyle argues for the position that some redistribution is a duty. This redistribution should be more extensive than allowed by the current U.S. foreign aid budget, but its appropriate level is difficult to peg with exactness (p. 435). According to Doyle, appropriate redistribution will depend upon many factors, such as the moral standing of individual wealthy and poor states (p. 434), whether they are participants in the "liberal peace" (p. 435), the legitimate security concerns of the donor (p. 435), and concern for the moral autonomy of citizens in the wealthy states (they should not be coerced into the role of "moral saints," p. 433).

This highly qualified verdict gives a good sense of the type of theoretical outlook Doyle wishes to forge as a guide to contemporary policy. It is a mixed one. Doyle wants to fashion an outlook on international politics that combines preferred elements from each of the three fundamental perspectives (p. 495). This does not necessarily mean a sacrifice of theoretical coherence, since at least some authors in each of the traditions mix elements in just this way. Perhaps the perspective Doyle prefers is closest to his understanding of Thucydides, who combined fairly hard-headed realism with a genuine moral concern (pp. 82–3). This would not be a bad model to follow. The outlines of Doyle's international ethics, however, are somewhat more difficult to make out. This is in part because of his laudable refusal to oversimplify the complexities of international politics and ethics, and in part because he wishes to provide guideposts for thinking, rather than a full-blown theory of his own. Readers wishing to make a fresh start on their thinking about international politics and ethics will find this book an admirable starting point.

Leo Strauss and the American Right. By Shadia B. Drury. New York: St. Martin's, 1997. 239p. \$35.00.

James F. Ward, *University of Massachusetts Boston*

Shadia Drury's book is necessary reading for anyone interested in Leo Strauss's political teaching, its significance, and its influence. Although it is not a perfect book of its kind, it raises questions disciples of Strauss should, but I suspect many will not, address with a seriousness commensurate to their importance. Strauss appears here as a thinker of the radical Right who has had a profound influence on the "political triumph of neoconservatism in America" (p. xi). Drury makes a strong case that Strauss is profoundly hostile to liberal democracy; his alleged defenses of it, so frequently cited by his students or defenders, are both misunderstood and given excessive weight by them. This is an extremely provocative reading of Strauss, who is portrayed by many Straussians as having recovered classical antiquity the better to defend liberal democracy against its own excesses, and by many of his critics as having provided an especially influential statement of political conservatism. In this book, Strauss is no conservative but, rather, a radical Nietzschean who rejects modern liberalism or liberal democracy root and branch because he believes that it erodes and destroys the public and specifically religious orthodoxy necessary for the maintenance, even the very existence, of political society.

According to Drury, Strauss believes that because genuine philosophers recognize that the "truth is dark and sordid," they construct salutary myths, orthodoxies for the many, while teaching their disciples that "all truth is fabrication, that justice is doing good to friends and evil to enemies, and that the only good is one's own pleasure" (pp. 17–8). She further holds that Strauss's antipathy to liberalism is principled; he opposes its fundamental ideals, "secular politics, human rights, equal dignity, and individual freedom" and not simply its faults (p. 10). Drury argues that unlike conservatives, however, Strauss does not truly appeal to tradition, for he knows that "tradition is the conscious creation of philosophers-lawgivers-prophets" or Nietzschean supermen who invent, and must then conceal their invention of, the myths or frauds required for society (pp. 11–2). This book continues the author's interpretation of Strauss as presented in her *The Political Ideas of Leo Strauss* (1988) and in a chapter in a later book, *Alexandre Kojève: The Roots of Postmodern Politics* (1994).

For Strauss and his disciples, Drury argues, liberal democracy is exemplified by the Weimar Republic, whose fate could well be America's future unless liberalism is somehow diminished in or purged from the American regime. She maintains the political actions of Straussians consist of attempts to reinterpret the American founding in order to detach liberalism from it as much as possible and to forge an alliance with the religious Right, or more generally, to attempt to use populism to separate liberalism from democracy.

The present book is concerned with the Straussian filiation of neoconservatism and thus of what Drury regards, without adducing evidence, as the "dominant ideology" of the Republican Party (p. 137). The book straddles somewhat uneasily a boundary between political commentary—here of the dangers Straussian-influenced neoconservatism poses to liberal democracy—and criticism of Strauss as the source of those dangers. The introductory first chapter recounts the visibility of some of Strauss's students and followers in American government and Republican politics. The second and third chapters are the intellectual core of the book, concerned, respectively, with Strauss's complex relationship to his "Jewish heritage" and his significant intellectual debts to Carl Schmitt and Heidegger. The fourth chapter rehearses and criticizes the political teachings of Harry Jaffa, Allan Bloom, and Willmoore Kendall as followers of Strauss who, like their master, exhibit contempt for much of the modern liberal enterprise. The final chapter on neoconservatism is devoted to Irving Kristol as the most politically influential continuator of Strauss's "radical and reactionary" (p. 161) perspective.

For Drury the "key to understanding Strauss rests in comprehending his efforts to reconcile" his legacy from Judaism with his legacy from German philosophy, "a posture of resignation in the face of the injustice and tragedy of life," with "a political romanticism that gave him an aversion to liberal democracy" (p. 33). The author's interpretation of the former topic is, for me, the most intriguing part of the book. Drury maintains that for Strauss the "Jewish problem" is unsolvable, for neither assimilation, nor liberal democracy, nor political Zionism can eliminate the need for Jews who would live as Jews to live with persecution. She goes on to argue that the Jews for Strauss are an essentially religious and thus an essentially antimodern people, which makes the universalism, secularism, and individualism of liberal democracy profoundly antithetical to their identity. She views Strauss as a Jewish nationalist who sees liberalism as a "special threat to the uniqueness of peoples" (p. 42). In the most acute discussion in the book (pp. 54–64), Drury criticizes Strauss's understanding of Judaism as excessively political. Moreover, his notion of the philosopher-prophet as standing beyond good and evil is a secularized version of the teachings of Kabbalistic mysticism. Strauss's philosopher-prophet is a "secular messiah" who brings divine law from the "abyss of nihilism," engendering, for Drury, a terrifying political ideal that "leaves us entirely at the mercy of cunning and ambitious priests" (pp. 63–4).

The chapter on Heidegger and Schmitt is less satisfactory, primarily because Drury's treatment of Heidegger is superficial. While Strauss shares Heidegger's abhorrence of modernity, he regards Nietzsche as superior in his grasp of both the disease of and the cure for modernity. Drury accepts uncritically the opinion that Heidegger's teaching is best understood as individualist and nonconformist, and she relies here (as she does in her discussions of Plato and Nietzsche) on conventional interpretations. She believes that Strauss shares with Heidegger an apocalyptic sense of the crisis of modernity, a belief that philosophers should influence those

in power, a radical aspiration to begin anew, and a "self-referential" (p. 77) way of reading the works of the philosophers. Drury simply accepts the received opinion that Strauss and Heidegger distort the texts of the philosophers without examining this issue herself.

According to Drury, Strauss adapts and radicalizes Schmitt's critique of liberalism in his own critique of American liberalism. He accepts and accentuates Schmitt's rejection of liberalism as antipolitical and agrees that the political is the necessary opposition of friend and foe. Strauss embraces the political, celebrating it as superior to a "depoliticized" world (p. 92). Against Schmitt, Strauss proposes to "re-theologize the political" to inspire the kind of loyalty and self-sacrifice essential to politics (p. 93). Finally, Schmitt and Strauss reject universalism and know and celebrate only the particular, the nation, the people; thus, in their own ways, they are eminent postmoderns (p. 95).

The author refers to most, although not all, of Strauss's published writings, but she engages in very little close reading of any of them. She excels at finding passages that shock the sensibilities of liberals, but we are entitled to ask whether Strauss's works are as easily understood and as politically transparent as Drury believes. For her, Strauss's message is "loud and clear to anyone who is patient enough to read carefully and to the end" (p. 49). Yet, there remain a number of mutually incompatible readings of Strauss, produced by some of his best students. Drury's reading is relentlessly political. Evidently, she finds nothing in Strauss's books that surprises, puzzles, astonishes, or delights, and she has no use for the claim made by students of Strauss that he is a *zetetic* or authentic skeptic. She reads Strauss narrowly, like critics of Heidegger who read his work exclusively for Nazi resonances and are oblivious to any thought for which this correlation cannot be readily established. I am inclined to think that Strauss's works, to borrow a remark Derrida made concerning Heidegger, have immense reserves, that they do not, contrary to Drury, foreclose inquiry.

Drury is a liberal who is not unsympathetic to conservatism. She recognizes, to her credit, that liberalism is vulnerable because it opposes the "human proclivity" (p. 175) for homogeneous social identity. It is ultimately fragile, a "heroic achievement against nearly insurmountable odds" (p. 176). Liberalism is exposed as well to the difficulty that it is not a glamorous political position. It regards politics as a "practical and prosaic affair—not the stuff of poetry and martyrdom," for it "is not the business of politics to intensify life, to give it meaning, mystery, and magic" (p. 43). Defenses of liberalism will seldom satisfy political romantics of the Left and Right. Drury's reading of Strauss has merit because it allows us to recognize more fully the gulf both wide and deep between liberalism and political romanticism.

The New Golden Rule: Community and Morality in a Democratic Society. By Amitai Etzioni. New York: Basic Books, 1996. 314p. \$27.50.

Jeff Spinner-Halev, *University of Nebraska-Lincoln*

Amitai Etzioni has written this book to clarify his version of communitarianism. He was partly prodded by critics of his earlier books to write this new one, but he explicitly avoids lengthy scholarly disputes, even as he drops names left and right. Indeed, this book often reads as a manifesto (though a rather long one). Keep your seat belt on if you read this book: Etzioni often moves from topic to topic with lightning speed. There is a new heading or subheading every couple of pages, sometimes every page (and occasionally every paragraph or

two). The moral problem with lawyers defending the indefensible is discussed in one and one-half pages; seat belt, speed limit, and helmet laws are discussed in three paragraphs, while Habermas gets two.

Those familiar with the more popular communitarian arguments will not find much new here. Many of his policy prescriptions and moral urgings are familiar and usually sensible. Those in the dark, however, and who are curious to know how communitarians want to change society will profit from this book. (Unless they want to look up the communitarian platform on the World Wide Web; Etzioni conveniently lists in the preface the Web address of the Communitarian Network, which he founded. Or you can call: Etzioni lists the toll-free number of the network in an endnote so you can order their position papers.)

The core of Etzioni's argument is that our society should establish a new golden rule: "A good society requires an order that is aligned with the moral commitments of the members" (p. 12). Figuring out the meaning of these moral commitments is tricky business, of course, and Etzioni sometimes avoids it. Indeed, he drops the idea of moral commitments when he later defines the new golden rule as one in which order "is balanced with autonomy" (p. 165). Much of the first half of the book reads as a defense of the later version of the golden rule: We must learn to balance autonomy with order. Some societies, like China, emphasize order too much and crush autonomy when they do so. Other societies, like the United States, emphasize autonomy too much at the expense of order.

Etzioni claims that American society is now characterized by excessive individualism. The accusations are familiar. Individualists want rights, not responsibilities; they criticize metal detectors in airports, drug testing of school bus drivers, and roadblocks to catch drunken drivers. Individualists' highest value, and sometimes their only value, is the right to choose. Etzioni, however, thinks that this position ignores the social attachments that are crucial to a good society. Yet, he thinks that social conservatives who have a bad case of nostalgia and want to revert to the supposed utopia of the 1950s are trying to resurrect an oppressive social and political structure. Etzioni calls for a resurrection of communities, communities that support both autonomy and order and that respect the dignity of all their members. He wants a community of communities, in which people have multiple memberships, so no one membership is so stifling as to stamp out one's autonomy. If you dislike the direction of a community, and you cannot change it, then you can simply devote your energies to another community.

While many liberals may be suspicious of a call for more order in society, what Etzioni often means by order is more familiar and palatable. He wants people to curb their desire to act selfishly. He contends that people are born self-interested, but over time a set of values that recognize our social nature and the communities in which we live can be encouraged and instilled within us. There is a tension, Etzioni claims, between the "pleasure principle and the moral voice" that is within us all (p. 170).

Etzioni argues that we should not rely mostly or only on laws to ensure order. Rather, the good society must be guided by shared moral values that condone certain behaviors and condemn others. Etzioni does not dismiss the importance of laws but argues that values must be shared for a moral and orderly society. These moral values can be revealed and established through a "megalogue"—a moral dialogue that takes place in local and national forums. That these dialogues not be only national is important for Etzioni. He argues that

local communities are important places to nurture and hear the "moral voice" needed in megalogues.

Etzioni admits that megalogues are a bit fuzzy, and he tries to deflect the criticism that he is actually long on moral hand-wringing and short on policy prescriptions by arguing for the importance of moral dialogue. This argument is unnecessary, though, for the second half of the book has many policy prescriptions. He argues for government funding for community organizations, the protection of public spaces, community courts and community policing; he insists that schools should be character-building agents, and he calls for a variety of ways to strengthen marriage, among other proposals.

Etzioni wants to drive a middle ground between social conservatives and liberal individualists. By leaving aside scholarly debates, however, Etzioni does not note how many liberals have responded to the communitarian critique in the last fifteen years or so. Many liberals today commonly argue that the state cannot be neutral on the good life, and that good democratic citizens have certain virtues which are best inculcated in schools, the family, and all kinds of local communities. By agreeing with these arguments and by holding on firmly to the idea of autonomy, Etzioni makes arguments that are distinctive from many liberal positions only when it comes to the details. It is hard to know exactly where these differences arise, since Etzioni rarely points them out or says how his arguments differ from liberals in any substantive way. Those who want to know how the theoretical differences between liberals and communitarians lead to policy differences will want to look elsewhere for guidance. Those who are looking for a primer on communitarian politics and policies will find this book useful.

Corrupting Youth: Political Education, Democratic Culture, and Political Theory. By J. Peter Euben. Princeton, NJ: Princeton University Press, 1997. 272p. \$55.00 cloth, \$18.95 paper.

Susan D. Collins, *Southern Illinois University at Carbondale*

In this rich and often moving study of the political and intellectual life of classical Athens, Peter Euben makes an impressive case that there exists a fundamental kinship between democratic politics and the philosophic activity of that most famous corrupter of youth, Socrates. Euben is aware that he defies a certain orthodoxy connected with Platonic political philosophy: the view that there exists an ineradicable tension between politics and philosophy in general, and between democracy and philosophy in particular. Euben's redefinition of these relations is more than an academic exercise. Moving gracefully between America at the millennium and classical Athens at its zenith and nadir, he seeks to shed light upon the debate over education in the contemporary "culture wars." He enlists the aid of such classics as Thucydides' history, Aristophanes' *Clouds*, Sophocles' *Antigone* and *Oedipus Tyrannus*, and Plato's *Apology*, *Gorgias*, and *Protagoras*. In illustrating the relevance of these great works of the Western tradition to our times, Euben sides not with the canon's usual defenders, whom he calls "conservative canonists," but with those whom he identifies as these canonists' "multicultural critics." Although he is not simply a partisan of the latter or a foe of the former, he nevertheless condemns the "didactic cooptation" and one-dimensional readings of the Greek texts by conservatives, and he proposes that multiculturalists, in their quest to challenge "the dominant voices in our culture," take inspiration from the "deeply radical impulse" of the very tradition they

challenge (p. xiv). In his own sometimes admittedly idiosyncratic reading of the works—he speaks, for example, of “my” Socrates of the *Apology*, and of his “against the grain” and “democratic” readings of Plato’s dialogues (pp. 54, 246, 204, 226–7)—Euben offers much evidence for his proposition. He draws links between Athenian political practices and Socratic critique, discovers common ground between Aristophanes and Socrates in the concern to preserve the best traditions of Athenian democracy, and brings to life a multivocal and paradoxical world of politics to which only democracy and Socratic dialectic, properly understood, can do justice. Euben’s case for the relation between democracy and Socratic political philosophy forms the serious core of his book and raises compelling questions, especially about the possibility of a “philosophic politics” and about the grounds of the Socratic way of life.

In its essence, Euben argues, Athenian democratic culture constituted a form of political independence and self-consciousness, as well as theoretical self-awareness. The “daring” typical of the Athenians, and celebrated in the “legitimizing story” of Athenian democracy, the naval battle at Salamis, had its source in a desire for liberation from all forms of authority, political and theoretical. Even as they sought empire over others, the Athenians undertook to bind power within their domestic sphere through such political practices as scrutiny and critique (see especially Euben’s discussion of *dokimasia* and *euthunai* in chapter 4), and in contrast to the Spartans, who were deferential in the face of what they saw to be “natural or divinely ordained necessities,” the Athenians conceived of the world as “moments of opportunity for the exercise of political and theoretical power” (pp. 80–1). Yet, “the cultural rhythms” initiated by Salamis, which were the basis of Athens’s freedom, proved also to be the source of its decline into tyranny; more generally, the Athenian rejection of all authority—of that which is to be revered without question—leads, if left unchecked, to the political and linguistic chaos described by Thucydides in his account of the Corcyrean Revolution. Euben seeks to show that the problem of maintaining political as well as epistemic order while preserving the freedom to criticize that order is the stuff of Aristophanic comedy and Sophoclean tragedy and lies at the heart of what he calls the “Socratic project” (p. 88). Socrates’ philosophic activity, he maintains, involves both the elaboration of “an already existent theoretical impulse” in Athenian democratic culture and the “grounding [of] that impulse in the traditions it threatens to destroy” (p. 88). On Euben’s reading of the *Apology*, *Gorgias*, and *Protagoras*, therefore, the deepest purpose of Socrates’ dialectical confrontations is not, finally, the refutation of the Oracle at Delphi but the promotion of a “philosophical citizenship” and “politicized philosophy” in accord with the finest traditions of Athenian democracy (p. 107).

Central to Euben’s argument is a theme familiar from his earlier work: the importance of what he calls “the tragic sensibility” to clarity about political life and human existence (see especially *The Tragedy of Political Theory*, *The Road Not Taken*, 1990). In his present study, Euben turns to Sophocles’ *Antigone* and *Oedipus Tyrannus* to lay out most fully the tragic view undergirding his position: The world into which we are thrown, he suggests, is one of multiple voices, meanings, differences, and oppositions we can never fully resolve or overcome; this is a world which ultimately eludes human comprehension and which, lacking a legitimating myth, will naturally devolve into chaos. Euben thus counsels that we create a political and philosophic discourse that is as inclusive as possible of the world’s many voices, differences, and oppositions, at the same time as we guard against that same

discourse becoming “hegemonic.” The promotion of such a democratic order is the proper end of political education, and Socratic dialectic is the political-philosophic vehicle upon which we may reach this end. In the midst of our rather precarious situation in the world, then, Euben and his Socrates, as a “paradigmatic educator of a democratic polity,” offer hope (pp. xi–xii; cf. chaps. 2 and 9). Or do they? Euben himself concludes on a tragic note, calling the “idea” of a “philosophical democracy” “a noble legacy and a seduction, the only aspiration worthy of political educators and sheer vanity” (p. 265). The tragic sensibility he has recommended as the true view and as a necessary “antidote” to misconceived and typically modern attempts to master nature and rationalize human affairs is also revelatory of the ultimate futility of even the best efforts to find a stable home amid the fundamental chaos. Our hopes, it seems, may be dashed at the very moment they are raised, the nobility of our aspiration having been undone by our realization of its vanity.

By both its critics and sympathizers, Euben’s *Corrupting Youth* will be admired for its mastery of the secondary literature, facility with old and new discourses, and lively readings of old works. The book’s most important contribution within and without the scholarly community, however, concerns human education. The first part of its subtitle notwithstanding, Euben’s return to classical Athens is about more than *political* education and *democratic* culture, strictly speaking. The larger frame of the book, to which the subtitle’s reference to political theory points, is the rebirth of efforts to understand the whole of human life, its moral and political dimensions, longings and hopes, evils and goods. As Euben’s study attests, these efforts cannot find direction absent a quest to understand the whole within which we exist. The sheer scope and quality of his work should raise the level of contemporary discourse and inspire especially the young to undertake the inquiries that an understanding of human life seems to demand. Yet, if that whole and that quest are such that they will always elude human comprehension—if, therefore, we can know about the world only that it is fundamentally tragic—then the possibility of a truly philosophic politics remains all the more unlikely, and the grounds of Socrates’ own activity and way of life are all the more mysterious than even Euben would seem to admit.

Tradition and Modernity: Philosophic Reflections on the African Experience. By Kwame Gyekye. New York: Oxford University Press, 1997. 338p. \$45.00 cloth, \$19.95 paper.

Crawford Young, *University of Wisconsin-Madison*

Kwame Gyekye is an ambitious scholar. A philosopher sometime of the University of Ghana, he undertakes a far-reaching excursion into the philosophic dimensions of the core dilemmas confronting the contemporary African state. In this endeavor, he seeks to marry current debates in moral philosophy with the empirical literatures relating to the African condition.

The resulting study, largely completed during a fellowship year at the Woodrow Wilson International Center for Scholars, covers a vast terrain. His acknowledgments of those who provided critical comments on the manuscript list an unusually distinguished roster of luminaries: from Amitai Etzioni and Will Kymlicka to Seymour Lipset and Ernest Gellner. Interestingly, none of them are Africanists, an intellectual domain in which the author understandably felt solidly implanted.

Gyekye, after locating himself in the broader realm of

philosophic discourse as a "moderate communitarian," explores the issue of whether there is an "African philosophy." Although he has no sympathy for Afrocentric framings of this issue, his analysis does presume a broadly similar sub-Saharan cultural heritage that permits and validates the continental perspective he adopts. He examines in turn the relative saliency of individual and community in African political thought, the (mis)uses of a presumption of ontological primacy of community in the African heritage as justification for socialist orientation, the problematic of ethnos and nation in the African state system, the elusive quest for legitimacy, the stain of corruption, and the master binary of "tradition" and "modernity" in understanding Africa.

Gyekye is always interesting, frequently combative, and sometimes unpersuasive in his analysis. One can only admire the systematic invocation of normative inquiry into such a broad range of questions. The scope of the ambition carries the inevitable corollary of the unevenness of the result.

The vertebral hypothesis of a general African culture and heritage encounters the contradictions of the evidence. The author, perhaps necessarily, relies heavily upon evidence drawn from his own Akan background; throughout, there is an inarticulate major premise that Akan patterns are paradigmatic for the continent. The many Akan proverbs he cites are indeed redolent of a practical but profound wisdom. But can they stand for Africa writ large?

Intriguingly, two other major contributors to the idea of an African philosophy drew essentially from the same cultural resource, though reaching different conclusions: Willie Abraham (*The Mind of Africa*, 1962), and K. Anthony Appiah (*In My Father's House: Africa in the Philosophy of Culture*, 1992). Indeed, the original contributor to the notion of a distinctive African cosmology, the Franciscan missionary Placide Tempels (*Bantu Philosophy*, 1948, not cited), likewise projected a Luba-Katanga template upon the continent.

An example of the problems arising is the argument that democratic elements are embedded in the cultural heritage. One can indeed identify important elements of consensus and consent in Akan and many other precolonial African political forms: the practice of destooling the autocratic ruler, in the case at hand. But the germs of democracy are difficult to detect in military conquest states, such as the Chaka Zulu kingdom, in the slave-raiding states, such as those of Rabeh or Msiri, or in the theocracies issuing from the Fulani Islamic revolutionary states in inner West Africa in the 18th and 19th century.

The use of the Akan category also bears reflection. Initially a purely linguistic classification of closely related languages, the more operative political identities were located one level down (Asante, Fante, Nzima, Akuapem, and others in Ghana, Baoule and some other Ivory Coast ethnic communities). The Akan category, however, has become something more than a purely external classificatory label in recent times. Here a larger point needs underlining: Identity politics in postcolonial Africa operates in complex ways; analysis must incorporate the multiplicity of levels, contingency, permeability, situational shifts, and evolving dynamics of identity construction and transaction.

The effort to capture in a reductive notational schema the multifaceted nature of ethnicity in politics, and its interaction with state institutions in quest of legitimacy and evolving discourses of "nation," is bound to fall short. Gyekye postulates the existence of a number of genuinely homogeneous nation-states (actually on close inspection relatively rare), labelled N1. Juxtaposed to these are the African norm of multinational states (N2), wherein state affective legitimacy rests upon a weakly articulated sense of "nationhood." The

normative path (nation-building) is toward N3, where a fully constructed nation is in place, and finally N4 (the "mentanation"), where the "toxic effects" (p. 103) of ethnicity are finally purged from the system. This rather evolutionary construct sits uneasily with the actual dynamics of social construction on the ground.

Gyekye takes a critical look at the argument—first advanced by the founding fathers of African socialism—Julius Nyerere, Kwame Nkrumah, and Leopold Senghor, among others that socialist doctrine could draw upon the powerful heritage of an essentially communal cultural heritage. The author persuasively demonstrates that the African tradition contained individual as well as communal elements, and that the communitarian reading was an obfuscation. This critique, though not entirely novel, does help explain the shabby, moth-eaten nature of "really existing socialism" in Africa by the 1980s. But to be fair, one need also acknowledge that similar pathologies of bloated and predatory states, oversized and underperforming, characterized much of Africa in the 1970s and 1980s, with or without benefit of socialist orientation.

An author of such large ambitions can hardly expect all readers to nod amen at every page. But the book deserves many readers, who are guaranteed stimulation in the arguments advanced, and admiration for the wide-ranging erudition of Gyekye. He makes a valuable contribution to joining philosophic reflection to political analysis.

Bodies of Law. By Alan Hyde. Princeton, NJ: Princeton University Press, 1997. 266p. \$49.95 cloth, \$16.95 paper.

Thomas F. Tierney, *Concord College*

Alan Hyde, a law professor at Rutgers, has read widely in the literature of body politics and has brought this scholarship to bear upon legal discourse. His intended audience is primarily students and professors of law, as well as attorneys and judges, and in regard to his audience his goal is to challenge the "cold metaphors" through which the law approaches the body, and which "proliferate so many discursive constructions of the body that none may ever seem 'natural' again—especially not a body's gender or race" (p. ix). Toward this end Hyde employs the writings of Michel Foucault, Judith Butler, Julia Kristeva, and many others, but he admittedly engages these writers in an "extremely light" manner (p. vii). Hyde's objective is not to use case law to support particular readings of these theorists but, rather, to use these theorists to open the law to multiple readings.

As for the larger audience of social and political theorists with whom Hyde would also like to "advance a dialogue" (p. vii), those who are hostile to constructivist claims may become more amenable to these upon exposure to the myriad legal constructions of the body that Hyde examines, especially since the powerful consequences of these constructions are not easily dismissed (p. 262). Theorists already indebted to writers like Foucault, Butler, and Kristeva are presumably not in need of any further persuasion about the discursively inscribed nature of the body, and given Hyde's allusive treatment of such writers, these theorists will not find much to argue with in this book. Nevertheless, *Bodies of Law* is a valuable resource for those already attuned to the discursiveness of the body, in that it provides many examples of body constructions that could bear further theoretical elucidation.

The book is divided into fifteen chapters, each of which examines a particular legal construction of the body, and these chapters are grouped into three divisions according to

the type of cases involved. For the purposes of this review, the divisions can be distinguished by the dominant theoretical influences that Hyde employs in interpreting the cases. The first part, "Regulation," relies primarily on Foucault to interpret cases involving the sale and donation of bodily fluids and parts, abortion rights, and impaired reproductive capacity (both as a condition of employment and as the result of accident). Part 2, "Desire," examines cases of compelled and suppressed bodily displays, body searches of prisoners and suspects, the measurement of penile arousal as a condition of reemployment, and the forced medication of prisoners. Many of the cases in this section turn on gender distinctions made by the courts, and Butler's writings figure prominently here. The third part, "Abjection," uses Kristeva's writings to interpret cases involving urine testing, contested racial identities, mandatory vaccination policies, and the exclusion of offensive bodies from public settings as instances of public purification rituals.

Through this encyclopedic examination of case law, Hyde convincingly demonstrates that any strategy for protecting bodies from economic or public intrusion which relies upon constructions of the body as property, a privacy interest, or an inviolable realm of individual autonomy can do so only by further exposing bodies to intrusion by these same forces. To claim property rights in the body, for instance, is to "inscribe them into the normal regulatory apparatus of consumer and market society, a world of contracts and compensation, domination mystified as economic exchange" (p. 76; also see p. 93). Similarly, the recognition of privacy interests in the body, as in regard to abortion rights (pp. 82–6) or the Fourth Amendment right against unreasonable searches (pp. 154–86), only places those interests in a balance with the public interest that threatens to outweigh them. "The paradox" of the dominant legal strategies, Hyde claims, "is that the body is protected in contemporary law only by means guaranteed to subjugate it" (p. 200).

Although his task is primarily deconstructive, Hyde mentions, but does not develop in detail, an alternative "prototype for the body of law that should be constructed much more frequently" (p. 97). This preferred construction is a narrative that presents the body not as an abstraction that is common to all individuals but as a particular body in specific circumstances with which others can empathize. Hyde is not excessively sanguine, however, about the prospects of even this strategy in the existing legal environment. He applauds one case in which a woman was able to win compensation for loss of consortium through the use of such a personal narrative (pp. 100–3), and he decries another in which a woman was forced to submit to a vaginal search for illegal drugs because of her relation to her husband, a suspected drug smuggler (p. 170). In order to foster the deployment of such body narratives in "the service of human coexistence, understanding, and empowerment" (p. 235), Hyde concludes the book with a brief discussion of an alternative, utopian legal perspective that he calls "a body fantasia." This perspective would "develop a discourse of bodily presence not absence, pleasure not pain, wholeness not fetishism, relations not isolation, connection not display, fusion not difference, incorporation not abjection, play not control" (p. 263).

Hyde is clearly aware of the obstacles that such an alternative legal discourse faces in liberal judicial systems. Indeed, throughout his text he inadvertently indicates just how difficult such a transformation would be to accomplish. Although he repeatedly acknowledges that there is no physical, material body available beyond or underneath discourse (e.g., pp. 6, 187, 240), when Hyde aggressively challenges a judicial decision regarding a specific bodily intrusion, he often comes

close to condemning the court for ignoring just such a "real" body (e.g., pp. 85, 157, 243). This is not to criticize Hyde for inconsistency but to point out how effectively the deep-seated adversarial nature of American juridical discourse constrains the introduction of playfulness and contingency into the law. Even those lawyers who have learned Hyde's lesson—that any claim they make about the body, even a narrative of the sort that he favors, is an arbitrary and contestable construction they are employing for instrumental purposes (pp. 6, 235)—will be reluctant to acknowledge this "provisional and artificial quality" (p. 4) in the heat of a legal contest.

In this attempt to provide legal practitioners with a wide array of body constructions from which to choose, Hyde has employed an impressive range of contemporary theory that extends far beyond the primary theorists mentioned in this review. Yet, *Bodies of Law* should not be approached as a law professor's attempt to do theory, which would only subsume Hyde's project in quarrels about the finer points of interpretation of the many theorists he employs, or mire it in debates about the ontological status of the body. Rather, *Bodies of Law* should be approached as a poignant reminder of the various ways that political theory is inscribed in bodies through the law and as an invitation to theorists to join in challenging and expanding the prevailing parameters of the juridical construction of the body.

Creatures of Prometheus: Gender and the Politics of Technology. By Timothy V. Kaufman-Osborn. Lanham, MD: Rowman & Littlefield, 1997. 292p. \$57.50 cloth, \$22.95 paper.

Ruth Abbey, *University of Western Australia*

Finding a title for this book cannot have been easy. One of Kaufman-Osborn's major concerns is to challenge ways of thinking about the relationships between human identity and the things we make. He is suspicious of the term *technology*, finding it too gross and essentialist to make much sense of the many different sorts of things humans make. He also detects in it traces of the Cartesian approach to identity that he criticizes relentlessly throughout the book for positing an autonomous, bounded self that works on and controls a mindless, inherently meaningless, and endlessly malleable world of objects. The author's insistence that humans are both made by and makers of the things we create means, however, that the eponymous Prometheus is himself both creature and creator.

To threaten any firm separation between subject and object, Kaufman-Osborn's preferred term for humans is "artifact" and for objects it is "artisanal artifacts." He stresses that the arrows of influence run between both sorts of artifact. Adapting Elaine Scarry's dialectic of projection and reciprocation, he offers an account of the ways in which embodied humans engage with and are shaped by the world of artifacts which precedes and survives us. When humans project themselves onto the world, we create things that relieve or reduce the effects of our physical and intellectual limitations. Knitting a pair of gloves for winter is an example of projection. Projection removes or mitigates the effects of physical vulnerability and thereby frees humans, releasing potential for more and different action. With warm hands I can build a shelter to protect my whole body from the cold, which in turn will enable me to engage in other activities. Through the work of projection and reciprocation we both acknowledge and transcend our needs as embodied creatures.

The author's second major concern is with how gender is

implicated in the production of artisanal artifacts. Kaufman-Osborn portrays gender as an artifact, as something produced partly through the different things that men and women typically make and the different tools used in these processes. The different roles of men and women in reproduction is an important, but not unique, example of the way working produces gender. His reciprocal proposition that artisanal artifacts are also gendered requires a more sustained argument to be convincing. The claim, for example, that men's tools are thought of as technology but women's are not is unpersuasive to this reader.

The third important artifact Kaufman-Osborn identifies is language. Language classifies and identifies things but is not unconstrained in this; certain artifacts stubbornly resist some classifications. As this suggests, he resists the deification of language he sees in some strains of postmodern thought. Moreover, he wants to rescue the idea of extradiscursive experience from linguistic reductionism by insisting that things can be known outside of language, that the body can feel things either without or prior to their being articulated.

These three sorts of artifact—human, artisanal, and linguistic—can be disintricated only in thought; in reality they are always connected in some way or other, and any one of three modes of agency can alter these relations. Underlying all this is Kaufman-Osborn's concern with the presence and power of the unreflected background of our daily practices. He strives to remind us how influential the things we routinely take for granted are; we usually fail to notice their significance until they break down or confound our expectations in some way. He also wants to draw attention to how much work is congealed in these everyday artisanal artifacts.

There is obviously a good deal of Marxian influence in the author's approach and concerns; more in fact than is signalled by the book's explicit references to Marx. Nietzschean holism is also invoked to defend the premise that meaning and identity are always relational. The pragmatism of Dewey and James further informs many of this book's arguments. Inspired by these traditional sources, Kaufman-Osborn takes issue with contemporary theorists, such as Donna Haraway, Judith Butler, Iris Marion Young, and Richard Rorty.

While the first and second parts of the book expound Kaufman-Osborn's theoretical approaches, the third explores these through stories: a section from the *Iliad*; Mary Shelley's *Frankenstein*; and two stories about Chernobyl; one told by a Soviet nuclear physicist and the other by the novelist Christa Wolf. Given the book's theoretical dedication to daily life, it might have been more consistent, as well as more useful and interesting, to devote more of these pages to showing how the author's preferred way of talking about things sheds new light on contemporary issues. He claims, for example, that the gun lobby's observation that "guns don't kill people, people do" presupposes the Cartesian paradigm of use, and the development of this type of engaged argument would have been welcome.

When I was reading this book, two pubescent boys in Arkansas murdered four of their female peers and a female teacher. This provided graphic illustration of Kaufman-Osborn's insistence upon the mutual constitution of identity, gender, and objects. These boys grew into a world saturated with guns; being shooters had been part of their identity from a remarkably young age. Conversely, the media have made no mention of what skill with guns the five dead women had, from which it might be inferred that proficiency with guns was not an integral part of their development. Shortly after, however, a young girl shot herself at school in Chapel Hill. Interpreting events like these, along with others less tragic

from ordinary life, would have improved and enlivened this third section of the book.

John Locke and the Origins of Private Property: Philosophical Explorations of Individualism, Community, and Equality. By Matthew H. Kramer. New York: Cambridge University Press, 1997. 347p. \$59.95.

Eduardo A. Velásquez, *Washington and Lee University*

John Locke's vision of the prepolitical and political condition of human beings, of the inherent powers by which so-called individuals appropriate and master the gifts of nature through labor, and of the use of those powers to create governments for the protection of their persons and property stands at the fountainhead of liberal political philosophy. This vision is no mere abstraction. Locke's doctrine of rights, chief among them the right to the fruits of our labors, is arguably the very soul of the American republic, if not of liberal republicanism generally. In a study that is bound to startle most students of Locke, Matthew H. Kramer proposes a reinterpretation of the central pillars of the Lockean and liberal edifice. The arguments of *John Locke and the Origins of Private Property* supposedly demonstrate that the "apparent individualism of Locke's labor theory of property is rooted in a thoroughgoing communitarianism" (pp. xi, 3). But in coming to terms with Locke's communitarianism, the reader should not think that Kramer's study "tries to blend or junction . . . communitarian elements and individualistic elements in Locke's thought." Instead of "merely being coupled with individualism," Kramer argues that "the communitarianism in the Lockean state of nature would engulf individualism and would employ it for communitarian purposes. Individualism was never absent, but it was starkly epiphenomenal" (p. x). Moreover, Kramer does not side with the likes of Charles Taylor, Jean Bethke Elshtain, Michael Sandel, Alasdair MacIntyre, and other communitarian critics of liberalism (p. 3). Kramer engages Locke on his own terms in order to show that his "atomism was itself utterly collectivistic" (p. 4). The "rights of the individual in the state of nature were but facets or offshoots of humankind's collective ideals and purposes" (p. 3).

Locke, however, is not a self-conscious communitarian. "Having taken his axioms as givens," Kramer writes, "we proceed to observe that he committed some downright blunders in the argumentative uses to which he put those axioms" (p. 12). By reasoning through Locke's "blunders," as Kramer purports to do, interpreters can now appreciate the extent to which the cherished individualism bequeathed to us by the author of the *Second Treatise* is viable only by taking seriously Locke's unconscious collectivist or communitarian "ideals and purposes." Among the most serious mistakes Kramer notes is Locke's attempt to "derive the norm of political equality from a thesis about physical and mental equality" (p. 38). To demonstrate Locke's faulty reasoning, Kramer turns to a familiar passage in the *Second Treatise* (II, p. 4), where Locke argues that all power and jurisdiction is reciprocal, "there being nothing more evident, than that Creatures of the same species and rank promiscuously born to all the same advantages of Nature, and to the use of the same faculties, would be equal to one amongst another without Subordination and Subjection." Locke here is interpreted to mean that "human beings patently all belonged to the same species, with roughly the same endowments; hence, Locke insisted, they were bound to refrain from wielding any dominion over one another" (p. 38). In a lengthy chapter devoted to "Equality Unlocked" (pp. 37–89), Kramer then

proceeds to show that the "fact" of human equality does not issue in the "norm" that all human beings should treat one another as equals, at least not without having those "norms" buttressed by communitarian presuppositions. Locke's blunder is further accentuated when we consider that his devotion to equality is intimately bound to his defense of freedom (pp. 46–8).

Having demonstrated how Locke's premises about human equality and freedom do not necessarily issue in a respect for natural rights, much less than in a community of mutually respecting, tolerant, and civil human beings, Kramer turns to Locke's theory of property. "With his recountal of the paths by which human beings qua autonomous agents could procure things as owned possessions," Kramer concludes, Locke "revealed quite inadvertently that autonomous agents would strip themselves of autonomy by dint of exercising it" (p. 91). Although "the maximizing of overall welfare could sometimes occur through the maximizing of every individual's welfare," a position we ascribe to Locke and to liberal capitalism generally, Kramer argues that the public good is not necessarily or consistently served by the emancipation of individual acquisitiveness. Arguments which "pose their theses as theses of overall production, must refer to the good of humanity rather than the good of all persons qua individuals" (p. 125). Locke's implicit communitarianism becomes explicit by our noticing that "efficiency-centered line of justification for private ownership must advance its refrain in a collectivist key, by pointing to the implication of private ownership for the common weal and by having to disregard the implications of private ownership for the standing of each person considered separately" (p. 126). Locke's supposed claim on behalf of nature's bounty does not rescue his individualism (pp. 102–6).

Kramer's thesis invites scholars to consider important questions and problems that abound throughout the *Second Treatise*. But it is likely to strike the reader that those questions are not necessarily the ones Kramer himself entertains, to his detriment and ours. Consider only one. Conspicuously absent throughout Kramer's work is a necessary appreciation of the rhetorical art, of the differences between the demands of persuasion and logical consistency, of the manner in which Locke fashioned arguments in the context of the contentious political climate of his time. Now, to say that Locke was a political writer makes one neither a disciple nor a dupe of Leo Strauss and other exegetes of esoteric writing (p. xi). But a short experience in the world can teach the importance of tact. And tactful Locke certainly was. Not every premise advanced at, say, the beginning of the *Second Treatise* is sustained by conclusions that emerge later, and of this Locke is more than aware. For example, the argument in chapter II, section 6, of the *Second Treatise*, according to which human beings are the "workmanship of one omnipotent, and infinitely wise maker" and thus obliged not to destroy themselves or any other person, is very difficult to reconcile with the argument in chapter V, section 27, according to which "man has a *property* in his own person."

It is well beyond my scope here to explore what these apparent contradictions mean. I only point out that no reading of *Second Treatise* will illumine Locke's purposes without attention to tensions Locke *himself* weaves throughout his work. Locke is aware that civil society does not eradicate the "inconveniences" of the state of nature. As to the benefits of commercial society that are the fruit of emancipated acquisitiveness, there is good reason to suspect that the state of nature serves as an apt metaphor for the transactions of the "marketplace." At the center of Locke's teaching one discovers less than edifying premises about the motives that propel humans to action. That our examination

of these motives uncovers a necessary admixture of virtues and vices, that the provisions of the Deity are less than adequate to the exigencies of our individual and collective well-being, that the wants of individuals are not in harmony with those of the community but must be made so, are only a few of Lockes' teachings obscured or ignored by the failure to engage Locke's rhetoric. Consequently, *John Locke and the Origins of Private Property* turns out to be an intriguing collection of Kramer's own "philosophical explorations of individualism, community, and equality"; much less is it an interpretation that sheds light on the methods, aims, and character of Locke's political philosophy.

Piety and Humanity: Essays on Religion and Early Modern Political Philosophy. Edited by Douglas Kries. Lanham, MD: Rowman & Littlefield, 1997. 286p. \$68.00 cloth, \$24.95 paper.

Peter Augustine Lawler, *Berry College*

This excellent book is a most impressive and thorough defense of the relationship between "early modern political philosophy" and "the theologico-political problem" first put forward by Leo Strauss. Its fundamental premise concerns the power of ideas, especially political ideas, in shaping history. The modern world is largely the creation of political philosophers who viewed revealed religion as their chief adversary. Christianity and Judaism, owing to human weakness, could not be completely destroyed, but they could be refashioned in a way compatible with demands of liberal, democratic government. The rule of God and priests could be replaced by self-rule. The modern goal, finally, is autonomy, to which even prosperity is subordinated.

For most of this book's authors at least, it is clear that Machiavelli, Bacon, Hobbes, Spinoza, Locke, Montesquieu, and Rousseau were all freed by reason from being moved personally by the challenge of revelation. They are best understood as using reason to free themselves and the world from the thrall of the Bible. But the dominant scholarly view remains that these philosophers were really believers or "sincere theists," unable to transcend through thought the religious prejudices of their time and place. Because Strauss himself did not convince scholars, more evidence, the authors believe, is required.

Andrea Ciliotta-Rubery's opening chapter is the book's most modest. In light of Strauss's recovery of Machiavelli's intention to manipulate Christianity for political purposes, she argues, Machiavelli's *Exhortation to Penance* can be read as clever subversion of Christian doctrine. On its own terms, she admits, all that can be said for certain is that Machiavelli's interpretation of the faith is strange, but not necessarily fraudulent.

David C. Innis captures the chilling hopelessness that lurks beneath the surface of Bacon's secularization of Christian hope in the *New Atlantis*. This chapter is the one most clearly critical of the elusiveness of the true goal of modern rationalism, and so it is especially to be recommended. Paul D. Cooke does a perfectly competent job of showing that Hobbes's Christianity is counterfeit, but he accepts too readily the thought that Hobbes's true standard is somehow both human reason and human sovereignty.

Martin D. Yaffe presents a most careful and brilliant account of Spinoza's *Theologico-Political Treatise*. He finds something good in Spinoza's destruction of the Bible's authority as the bond that holds political community together: We are now in a position to consider more freely the Bible's claim to be true. But doing so requires that we be more naive and more philosophical than the polemical and methodical Spinoza.

The three chapters on Locke actually disagree. Peter Myers argues that Locke was a rationalist who saw the limits of human reason, and thus, reason's incapacity to refute the claims of revelation. His Locke seems more Tocquevillian than characteristically modern in orientation. Dale S. Kuehne, the book's heretic, presents an anti-Calvinist but ultimately pro-Christian Locke. David Foster, with the preponderance of evidence on his side, counters that Locke's view of human freedom is actually radically antibiblical. His Locke is the most secular and materialistic of the three, but Foster can only muster a few limp words to question this modern extremism.

The last two chapters are by editor Douglas Kries. The first exposes Montesquieu's veiled attack on Christian historiography. The veil is not out of respect for Christian faith but for religion's political power. Kries also contributes a fine account of Rousseau's attempt to replace revealed religion with civil religion. He notes that the philosophic discrediting of the former has not led to the reemergence of the latter. Perhaps that is because the psychological criticism by the Christians of civil theology remains true, whether or not the Creator-God of the Bible actually exists.

The authors generally limit themselves to doing little more than showing the hostility of the early modern political philosophers to the claims for truth and political power of revealed religion. The authors are to be praised for doing what they set out to do. But because it had already been done to my satisfaction by Strauss and other Strauss-inspired writers, I wish they had turned more to criticism of the emptiness of modern rationalism. The authors' tendency is to let the modern philosophers off the hook too easily by saying too often that they were primarily defending liberated rationalism as such from piety. The Christians were surely right, after all, to call the pursuit of autonomy sin or prideful self-deception, or not really rational at all.

Harvy Mansfield, in the book's judicious Foreword, says that the modern political philosophers saw religion as a sign of human weakness. To the extent that their efforts replace weakness or dependence with self-sufficient strength, religion can wither away. But at the end of the great success and deeper failure of the modern world, we are more likely to admit that the fundamental human experience is one of limitation, and that modern efforts to deny or destroy that indestructible fact are themselves forms of weakness. If we are not nihilists, then we add that human life as it is actually experienced is nonetheless good.

Religion has not, in fact, withered away. The modern political philosophers said too little or almost nothing about affirming our limitations as the indispensable conditions of human goodness and human happiness. They have too little to say, as Allan Bloom, for one, complained, about the twinship of love and death.

The idea of toleration (of difference in religious lifestyles as well as in ethnic culture, general definition, or sexual orien-

tation) has become a major theme of political theory research in the 1980s and 1990s. These two collections of new scholarship expand knowledge of the multiple versions of religious toleration from the twelfth through the seventeenth century. *Difference and Dissent* considers the theorists of John of Salisbury, Marsiglio of Padua, John Wyclif, Christine de Pisan, Hans Denck, Sebastian Frank, Francisco de Vitoria, Bartolomé de Las Casas, Jean Bodin, Thomas Hobbes, Samuel Pufendorf, Benedict de Spinoza, and John Locke. *Beyond the Persecuting Society* not only considers practices of toleration in eastern Switzerland, 1525–1615, and in seventeenth-century Massachusetts, but also analyzes the thought of Peter Abelard, John of Salisbury, Menahem ben Solomon Ha-Ne'ira, the circle of Cardinal Pole, Jean Bodin, Samuel von Pufendorf, Pierre Bayle, Aphra Behn, and seventeenth-century religious skeptics and millenarian dogmatists. The editors are to be commended for inviting political theory colleagues in history, literature, philosophy, and religious studies to join with those more numerous in political science to broaden the issues upon which toleration is studied. Each volume has an index, notes following each article, and a statement about contributors.

In *Difference and Dissent*, Nederman and Laursen respond to contemporary critics of toleration by disengaging the identification of toleration with the line of thought extending from Locke through the Enlightenment to Mill. A communitarian functionalist theory of toleration appears in Nederman's discussion of the rights theory in John of Salisbury and Marsiglio of Padua and in Kate Forhan's analysis of Christine de Pisan's philosophy of the active interdependence of the different social classes and the tolerance of one part of the body politic to another part, including women and foreigners. Laursen's article on Spinoza shows that his more universalist, modern theory predated and possibly influenced Locke; the inclusion of articles on Spinoza and Bodin, who both exhibit toleration of Jews, Muslims, deists, skeptics, and other free-thinkers, shows by contrast Locke's limited focus on the toleration of Protestant dissidents by the established Church of England. The book concludes with William Walker's analysis of Locke's contention that persuasion is a kind of force; Locke's "ideal" commonwealth emerges as a place where all, including the ruler, have freedom and duty to persuade others concerning salvation.

Augustinian theology, according to Stephen Lahey, is the source of John Wyclif's belief in fair government rule over those destined for Hell. A more positive attitude is found in the Radical Protestant views of Hans Denck and Sebastian Franck, who, according to E. J. Furcha, value the divine spark in Jews, Muslims, and heathen; I would attribute that confidence to the Stoic thread in Erasmian humanism and to such medieval theorists of discourse among Christians, Jews, and Muslims as Raymond Lull. Such a view of the necessary premillennial forbearance of religious difference the editors appropriately label "concordance." In that category also is the toleration of Amerindian cultural difference in Vitoria and Las Casas, whose writings are viewed by Paul J. Cornish, as evidence that a Thomist framework allows protest against extreme injustice within general toleration of cultural difference.

Gary Remer interprets Jean Bodin as a theorist of pluralism who defends freedom to find one's own truth in a world where truth is knowable; the *Colloquium* he appropriately interprets not as a failed debate or a colloquy for conversion but as a successful model of how diverse religionists and doubters today might openly listen peaceably to one another's viewpoints. Glenn Burgess appreciates Hobbes's desire to distinguish religion from philosophy (truth claims) and

ecclesiastical polity from polity, and he views Hobbes not as a theorist of liberty of conscience but as a natural law theorist who contends that persecuting members of society for personal beliefs hurts political stability. Simone Zurbuchen interprets Samuel Pufendorf's rejection of the Revocation of the Edict of Nantes as an inconsistent blending of a republican argument for peace-producing balance in domestic and international politics and a natural law argument that religion is based on a natural freedom not delegated to the sovereign.

Beyond the Persecuting Society encourages contingent, local studies of toleration policies. The editors' introduction localizes and limits Locke and disputes the myths of relentless persecution in medieval and early modern times, of secularization encouraging toleration, of unilateral Christian intolerance of non-Christians. If this deconstruction is necessary, then obviously there has been a cultural lag between the work of numerous historians and the mainstream teaching in political theory.

The medieval section stresses openminded thinkers. Constant J. Mews's study of Peter Abelard's *Dialogue of a Philosopher with a Jew and a Christian* emphasizes Abelard's focus on rational ethics and his finding of a compatibility of such ethics with Jewish law and with Christianity. Mews shows Abelard's further development of dialogue in letters to Heloise and in his poem to his son. Nederman analyzes John of Salisbury's moderate Academic skepticism and his conviction that wise individuals might disagree.

The Jewish question appears from some important new angles. Gary Remer explores the very important issue of Jewish toleration of non-Jews, pointing out that Jewish law does not deny salvation to non-Jews, does not aim to convert all, and respects righteous gentiles; yet, the Provençal Talmudist Ha-Me'iri expanded Jewish toleration by clarifying that Christians are not idolatrous and that Talmudic regulations concerning trade with the idolatrous are not applicable to Jewish relations with Christians. Marion Leathers Kuntz emphasizes the Renaissance Catholic Venetian setting (where there were districts for Jews, Muslims, and Protestants) of Bodin's *Colloquium Heptaplomeres* and emphasizes that the open sharing of religious viewpoint without aim of conversion is musical harmony in that each voice is needed to complete the whole. Richard Popkin suggests that seventeenth-century millenarians who proposed temporary toleration until the near conversion of all to pure Christianity (such as Isaac La Peyrère or Anna Maria van Schurman) encouraged toleration as much as did the very different deists and nonreligious (such as Spinoza or Bayle).

Randolph Head's concise historical introduction to the sixteenth century focuses on the loci of limited toleration, and his article on eastern Swiss villages of Catholic majority and Protestant minority traces the shift from coexistence with Protestants worshipping in a neighboring village to sharing the same church for services of the two different religions. The account is a case study in conflict management and of variations in religious coexistence, where change is justified by custom rather than by principles of toleration. Likewise, Thomas F. Mayer's close study of Reginald Pole's possible influences on Thomas Starkey, Andras Dudic, and Gianbattista Binarid indicates the practical decisions made by the lenient, concordant Pole during the Marian Reformation.

Laursen's introduction to the seventeenth century focuses on the diverse motives for toleration amid the contingencies of civil discord in the variety of European states. Detlef Döring treats Samuel Pufendorf as a Lutheran natural law theorist who is not as liberal as Leibniz, except in the notion that the sciences should be free of influences of theology. Laursen highlights the turning points in Bayle's development

of his views on rights of conscience and toleration, which included preventative measures against those who would persecute others. Aphra Behn's novel *Oroonoko* exhibits a respect for the African hero's virtue and for deism that makes this female royalist poet and playwright an early advocate of toleration of diverse ethnic lifestyles. The concluding article on Massachusetts by H. Frank Way shows the colony shift from exiling Roger Williams and Anne Hutchinson, to a gentler policy during the English Restoration, and by 1708 to a grudging toleration of Quakers.

The overall contribution of *Difference and Dissent* is to recognize communitarian and natural law foundations of toleration theory and to encourage us to ask precisely whom a theorist is tolerating, whether s/he intends temporary concordance or permanent toleration, and to whom the theorist is not extending toleration. *Beyond the Persecuting Society* gives evidence of pockets of religious coexistence and of developments in toleration theory in Christian, Talmudic, literary, and philosophical authors of medieval and early modern Europe. Either book would be appropriate for an undergraduate or graduate course on political theory.

Politics and Truth: Political Theory and the Postmodern Challenge. By Theresa Man Ling Lee. Albany: State University of New York Press, 1997. 243p. \$17.95.

Louis Herman, *University of Hawaii at West Oahu*

Ever since the "polis killed Socrates," those who follow the truth quest have kept a sharp eye on those who wield power. Theresa Lee's exploration of politics and truth begins by noting that twentieth century politics is distinctive by way of how political ideas dominate the conduct of politics. The Cold War of political ideas has given way to the postmodern politicization of knowledge in the liberal democracies and the equally important depoliticization of knowledge in the Leninist socialist camp. This has given political theorists a unique opportunity, states Lee, to reconsider the fundamental principles of liberal democracy without any palpable threat.

Ironically, *Truth and Power*, a highly intelligent work of professional scholarship, exemplifies the sort of conventional theoretical writing that is quite irrelevant to those who wield the sword or those who are engineering the final stages of corporate globalization (or, for that matter, the lay citizen). The book is complex and makes much of small distinctions, which, elegant though they may be, are laboriously elaborated. Consequently, the book falls far short of taking us beyond the technical deconstructions of postmodernism; it fails to provide what it suggests is needed—a Socratic philosophical discourse which engages what Eric Voegelin called "the full amplitude of human experience" and still has some moral force. Yet, the book does provide some clearly defined points of departure and a few hints for a bolder, more creative revisioning that the discipline so badly needs.

Lee aims to evaluate postmodernism as an alternative to the duality of liberal democracy and Leninist socialism. She begins with Plato, the obvious paradigmatic thinker on power and truth, proceeds to Hobbes, then Weber, Foucault, and finally Arendt. Lee illustrates some of the book's main points by briefly considering the epistemological debate in post-Mao China, and the identity politics of liberal democracies, associated with postmodern attempts to reconstruct university curricula.

Lee's reading of Plato follows a popular, well-established reductionist interpretation via Nietzsche, Popper, Foucault, and Arendt (and many others). She presents Plato's notion of

philosophy as essentialist, providing absolutely transcendent standards, embodied in the aristocratic *Republic*; a defense against the "opinion" of the polis that killed the philosopher. Lee mentions Strauss and briefly considers Gadamer's more reflective interpretation, which credits Plato with a subtle, dialectical notion of philosophy. For Gadamer, the Socratic-Platonic dialogues embody the quest for meaning in the openness of authentic discussion; meaning is found in the "in-between" (Plato's *metaxy*); the movement of thought between opposing positions. The *Republic* is a moment in an ongoing dialogue, not to be understood literally, and certainly not as the final word. Politics and philosophy only have meaning in a creative tension with each other. After this sympathetic treatment Lee dismisses Gadamer, preferring to resolve Plato's paradox (between the aristocratic republic and a democratic truth quest) in favor of a tyranny of a philosophical elite. She marshals support by citing the familiar aristocratic passages from the *Republic*, emphasizing Plato's dogmatic insistence that "the dialectic is the only way to truth." In doing so Lee effectively reduces the dialectic to a technique and seems to miss the point: The dialectic is indispensable because knowledge only becomes politically significant "truth" in the process of being mediated by the logic of discussion; that is, by being brought into relation with the different experiences and perspectives of a community of philosophers. A dialectical understanding of philosophy and politics would put the two in a creative dynamic tension; philosophers would rule to the extent that they eschew the desire to rule, and those who rule would prefer the joys of the truth quest.

Lee carefully elucidates "postmodern" tendencies in Hobbes and Weber, usefully clarifying what remains thoroughly modern in some "postmodern" thinkers, especially Foucault. She notes that Foucault himself identified with the question and questioning strain in Enlightenment thought. Foucault's rejection of the principle of universality contained in all metanarratives results in a postmodernism and a politics "shaped by the Liberal sentiment that there is always 'too much governing'" (p. 110).

It is against this problematic that Lee turns to Arendt. Arendt, however, wants to defend politics from the totalitarian dangers of ideology by reproducing and elaborating a host of neo-Kantian distinctions, resulting in some convoluted if not absurd conclusions. Arendt distinguishes between, on the one hand, the rational truth of axioms and theories in "mathematics, science and philosophy (sic)" and, on the other hand, the factual truth of "facts and events . . . in the ever changing affairs of men." Factual truth is thus by definition political, intimately related to speech and Socratic praxis. Arendt and Lee then further distinguish this Socratic philosophy from an absolute Platonic truth and end up by insisting that "truth" and philosophy should have nothing to do with politics. It would make a lot more sense to reserve the term "ideology" for the reifications of thought that support totalitarian regimes, and preserve the terms "philosophy" and "truth" for the Socratic speech dialectic that Arendt and apparently Lee think appropriate for influencing political action. This would save Arendt, and a number of postmodernist philosophers, from the embarrassment of having to say things like "totalitarianism is a profound indictment of the role of philosophy in politics."

The conclusion, dealing with post-Mao China and identity politics, is by far the most interesting and creative section of the book and should have been expanded. Lee examines the reforms in post-Mao China, which took seriously the issue of epistemological standpoint. She claims that this analysis, contra Connolly's notion of agonistic democracy, shows that

"there is nothing intrinsically democratic in a political practice that recognizes that truth ought to be rooted in the reality of experience" (p. 153). Lee cites, among others, Deng's "emancipation of the mind," but I am not persuaded that these utterances have any more than a superficial resemblance to Connolly's radical critical approach. I think Lee is correct, however, in suggesting that the antifoundationalist, contextualist approach of postmodern "legitimation discourse" is "not necessarily . . . conducive to democratic practice" (p. 157).

Lee examines identity politics in the West as the other example of politics in the spirit of antifoundationalism. She points to the obvious insufficiency: Politics based on a single identity is divisive and corrupts any notion of a good of the whole. She seems to end up endorsing the standpoint perspective of Hartsock, with its unifying notion of individual "experience" integrating multiple identities (nested identities?). Lee implies that this is similar to Arendt's principled defense of politics from totalizing systems. Her final sentence notes inconclusively and apologetically that this is "fundamentally an essentialist postulation." Lee's own position on this and other important issues remains unclarified.

Lee's predicament is the predicament of much of postmodern political theory. On the one hand, there is revulsion against the absolute "isms" of modernity and their murderous regimes. On the other hand, there is a growing recognition (which is thoroughly Socratic-Platonic) that without some sort of principled shared understanding of the human condition and a collective "good," politics becomes capricious, vulnerable to demagogues and tyrants. Unfortunately, a rigid dualistic (Cartesian) habit of thought blocks most Western philosophers from thinking Socratically, that is, in terms of the meaning generated by the tension between opposites, and thus moving through the paradox. None of Lee's sources show much stomach for this sort of Socratic-dialectical (as apposed to the Marxist-Hegelian variety) thinking, with the exception perhaps of Gadamer; and Lee ignores those philosophers who do: on the Left, the early Frankfurt School thinkers, Horkheimer, Adorno, and Marcuse; and on the Right Eric Voegelin, who is one of the few modern philosophers to explore the dialectically formulated "truth quest" in world civilizations.

It is a pity Lee does not take this opportunity to respond with gusto to the postmodern challenge to engage "the other." Her interest in China would seem to position her well to go beyond jargon-filled epistemological tracts "celebrating difference," where all opinions and all cultures are indifferently equated. Many non-Western, premodern traditions, from Native American shamanism to Chinese Taoism, are quite comfortable with such paradoxical, Socratic-dialectical thinking and could help considerably in formulating a normatively compelling "foundationless" foundation; neither absolute nor arbitrary; secure enough to guide meaningful action yet constantly shifting.

Ecocritique: Contesting the Politics of Nature, Economy, and Culture. By Timothy W. Luke. Minneapolis: University of Minnesota Press, 1997. 253 p. \$49.95 cloth, \$19.95 paper.

Leslie Paul Thiele, *University of Florida*

One can estimate the maturity of a social movement by the caliber of its internal critics. A mature movement generates thoughtful criticism within its own ranks. Arguably, this internal dissent stimulates the movement's capacity for adaptive change. *Ecocritique* confirms that the environmental movement has come of age. In its nine chapters, each of

which has appeared in whole or part in other publications, Timothy Luke offers insightful assessments of selected environmental organizations, theorists, and orientations.

Luke is not the first internal critic of environmentalism. Indeed, for the last number of years a new book has appeared on the shelves every few months that takes (some segment of) the environmental movement to task for its shortfalls. Luke suggests that his book is unique because it addresses environmental thinkers and groups that hitherto have been ignored. Yet, his investigations of deep ecology, Earth First!, green consumerism, and social ecology, to identify the subjects of four chapters, rework well-tilled ground. That is not to say that fresh plowing is without merit. Luke's chapter on Earth First!, for instance, is balanced and informative. On the whole, however, the value of *Ecocritique* rests not so much with the originality of its subject matter as with the originality of its insights.

Luke does venture into less charted waters on a few occasions, such as his chapters on Biosphere 2 and Arcosanti. Biosphere 2 was an experiment in building an ecologically self-sufficient set of biomes within a self-contained architectural structure. It was meant to yield ecological knowledge by mimicking the workings of the Earth as a whole. Located outside Tucson, Arizona, Biosphere 2 became operational in September 1991. For the next two years, a crew of eight was sequestered in this largely self-sustaining microplanet, which from day one was plagued by malfunctions. Luke acknowledges the intellectual and technological resources that were marshaled to get Biosphere 2 off the ground, but he worries that in design and in fact it stayed there. Rather than better integrating human communities into the natural world, the experiment put a technocratic green disguise on a corporate capitalistic venture.

Arcosanti, located in central Arizona, was the brainchild of Italian architect Paolo Soleri. It was designed as an environmentally benign, automobile free, urban landscape. Grounded in a Teilhardian philosophy, Arcosanti was meant to accommodate many thousands of residents and serve as a model for future cities. Currently it is inhabited by less than 100 people and serves largely as a tourist attraction and convention center. Still, Soleri's visionary city provides an alternative to the abuse of ecological space, commonly known as "sprawl," that largely defines the contemporary American landscape. Luke is enthusiastic about the possibilities of ecological urban design. Yet, he worries that Arcosanti, like Biosphere II, prefigures a "global systematization in green governmentality" (p. 114). Soleri's arcology, Luke observes, "smacks of a puritan desert despotism" (p. 171).

The rise of green totalitarianism is a central theme of *Ecocritique*. Luke shares the concern of Charles Rubin (*The Green Crusade*, 1994) that environmentalists are enamored with centralized, intrusive governance of potentially planetary proportions. A chapter assessing the efforts of Lester Brown's Worldwatch Institute, known chiefly for its annual publication, *State of the World*, reworks this theme. According to Luke, the institute stands in alliance with corporate capitalism in developing ways to control people through global strategies of sustainable development. Applying the thought of Michel Foucault to environmental issues, Luke argues that Worldwatchers are chiefly in the business of "environmentalizing discipline" (p. 81), and their goal is "to police the planet" (p. 84). This perspective is provocative, but at times Luke's railings come close to the paranoia of radical antienvironmentalists, who fear the rise of the United Nations because it designates World Heritage Sites.

For Luke, nature has been denatured through the modification of life that accompanies corporate hegemony.

Instead of directly taking on the institutions of translational capitalism, however, he criticizes environmentalists for being insufficiently radical in their own struggles against these institutions. There is, of course, a long tradition of armchair philosophers haranguing social activists for their compromises. Still, the irony is pungent. It is heightened by the fact that Luke's critique of too-timid, business-friendly environmentalism has been accompanied by the standard academic practice of producing a resource-consuming literary commodity of dubious recyclable value.

The connections to corporate capitalism of many of the mainstream environmental organizations certainly deserves criticism. Yet, Luke might have given due to those environmental groups that assail—in word and deed—the ecological irresponsibility of corporate power, such as the Center for Health, Environment and Justice (formerly Citizens Clearinghouse for Hazardous Waste), Earth Island Institute, Friends of the Earth, and Greenpeace, to name but a few. Luke picks easier targets. He focuses on The Nature Conservancy (TNC), a wealthy, business-like organization that purchases ecologically rich land and sets it aside for preservation. Luke questions whether these efforts to preserve biologically diverse tracts of land actually undermines the "cause of Nature preservation" because it reduces "Nature to real estate" (p. 58). This reduction should never be accepted, Luke insists, though he does not address whether all forms of land ownership are equally illegitimate.

To acquire its land, TNC needs lots of money. Like many other environmental organizations, it engages in endless fundraising. For good reason, this focus on revenue worries Luke. For many, environmentalism has primarily become a business enterprise. But Luke is wrong to assume that TNC does not also solicit from its members and patrons the "more messy contributions [of] time, labor, or moral witness" (p. 61). Like most environmental organizations in America, it relies heavily on volunteer efforts. While paid staff at TNC number a few hundred, about 25,000 of its members contribute 300,000 hours yearly doing the messy volunteer work of ecological preservation and restoration.

Luke also mischaracterizes TNC's mission of safeguarding biodiversity. It is not a matter of protecting threatened species as isolated specimens of a former, biologically diverse, time. For Luke, TNC is nature's mortician, a "burial society dedicated to giving perpetual maintenance and loving care at a variety of Nature cemeteries" (p. 71). (Luke believes that Nature ended sometime in the not-too-distant past for some pretty obscure reasons, such as the penetration of national capitalism into Russia and China during the Nixon years and the oil crisis of the early 1970s.) In fact, TNC's goal, like that of most preservationist groups, is to safeguard the dynamic relationships among species and the capacity of species to evolve over time. Preserving many large, and preferably interconnected, chunks of natural habitat facilitates both species preservation and evolutionary adaptation.

In another chapter, Luke aptly questions whether the voluntary simplicity and frugality of green consumers will suffice to preserve nature in the face of a global economy structured by the logic of corporate capitalism. Luke's depiction of the omnipotence of corporate capitalism, however, has the effect of freeing the individual from all environmental responsibility and undermining the incentive for individuals to organize against institutionalized environmental degradation.

Luke disparages the efforts of those who espouse individual responsibility—organizations such as the Earth Works Group, which wrote the best-selling *50 Simple Things You Can Do to Save the Earth*. The naiveté of such do-good

approaches is troubling to be sure. Though political action and community organizing is recommended, it is not emphasized. For Luke, however, the problem is simply that these approaches are not radical enough. "Rather than pushing for waste elimination," Luke writes, "the Earth Works Group stands for waste reduction. Instead of advocating total economic transformation, it accepts weak bureaucratic regulation of present-day polluting processes. Unable to support the total reconstitution of today's productive forces, it advocates piecemeal reforms to lessen, but never end, their most environmentally destructive activities" (p. 123). Luke rejects "weak reformist strategy" (p. 122). He calls instead for a radical social transformation that would yield bioregionally decentralized communities operating in "equal partnership with Nature" (p. 208). The ultimate goal is "survivable communitarian ecologies within which people dominate neither other human beings nor their fellow nonhuman beings" (p. xiii). Presumably these biocentric, egalitarian, protoanarchistic communities would produce neither waste nor pollution.

Luke rejects "ecosocialist millenarianism." He also dismisses the "utopian ecologism" of deep ecologists because it fails to outline the practicable means for realizing its moral vision and, like most other revolutionary programs, lacks "a theory of the transition" (pp. 24–5). This is clearly a case of the pot calling the kettle black. Notwithstanding a fine chapter on Murray Bookchin's environmental philosophy and Luke's insistence that all environmental advocacy must be "workable and realistic" (p. 203), *Ecocritique* remains divorced from practicality and is a stranger to transitional strategy.

The "ecological populism" promoted by Luke would entail "rebuilding the contemporary city and society from the ground up around new aesthetic sensibilities." It would require "equal participation by every community member in shared action to make collective decisions," such that, in the end, everyone will hold "equitable shares of property, power, and privilege in the community commonwealth" (pp. 200–1). Luke's unwillingness to suggest any viable means of achieving these ends is troubling. It is particularly suspect owing to his disparagement of those who take the small steps that might slowly move individuals and societies down the road to ecological responsibility. Luke insists that "only the actions of a very small handful of the humans that are now living, namely those in significant positions of decisive managerial power in business or central executive authority in government, can truly do something to determine the future" (p. 126). That conviction is what most separates environmental activists from those who write books about environmental activists.

Reflecting on Plato's idealism, Aristotle observed that the best often becomes the enemy of the good. One senses that Luke's diatribe against environmental reformism gains its fire from a vision of the ecological and sociopolitical best. This alluring vision will never come closer to realization, however, if yearnings for what is best undermine all concrete efforts to achieve what is good. Luke's ideal of a global confederation of ecologically benign and fully egalitarian communities is infatuating. Yet, in the end, Luke's unwillingness to address the practical means of its achievement leaves the reader forlorn. One is reminded of the traveler who asked a resident for directions to a small town in the region. "Ah, yes, that's quite a few turns in the road. If I were you, I wouldn't start from here!"

That is a frustrating response, and *Ecocritique* is a frustrating book. But it is also lively, provocative, and insightful. With the understanding that frustration is often the mother

of invention, I would recommend *Ecocritique* to all those whose environmental concerns will be piqued rather than palsied by the dearth of easy solutions.

The Racial Contract. By Charles W. Mills. Ithaca, NY, and London: Cornell University Press, 1997. 171p. \$19.95.

Andrew Valls, *Morehouse College*

This is an ambitious little book, as it seeks to place race at the very center of political theory. Mills attempts to show that race has been an essential, though often unspoken, concept in modern Western political thought and that its importance must be acknowledged and analyzed if we are to overcome the legacies of our racist past (and present). Mills develops "a global theoretical framework for situating discussions of race and white racism" (p. 2) that can serve as "a conceptual bridge between . . . mainstream (i.e., white) ethics and political thought [and] . . . Native American, African American, and Third and Fourth World political thought" (p. 4). The framework is a contractarian one, derived from mainstream Western thought and used to engage and critique that tradition from the perspective of those who traditionally have been left out of the social contract and subjugated by it. The main thesis of the book, then, is that there has been, in the modern era, a global racial contract, the parties to which have been whites, and the substance of which has been the denial of nonwhites' status as fully human, "the exploitation of their bodies, land, and resources, and the denial of equal socioeconomic opportunities to them" (p. 11).

For those who agree that issues of race and racial justice demand far more attention from political theorists than they are currently receiving, the book is a welcome contribution. By showing the systematic and deeply embedded nature of racism in modern Western political theory and practice, Mills demonstrates that racist policies and ideas are not unfortunate divergences from the general rule of race neutrality but are themselves the rule in Western culture. In the process, Mills provides an analytical framework that connects claims for domestic racial justice and those for international justice. In all these respects, the book is an important contribution to current discussions about justice in both realms.

The book is marred by some shortcomings, the greatest of which is that the arguments it presents are often too truncated to be fully persuasive. This may be due to the author's desire to produce "a short, punchy book" (p. x) that must sacrifice some precision and detail for accessibility. Still, this reader often wished Mills had sacrificed some of the book's punchiness for greater philosophical depth. One example is the discussion of the major figures in the social contract tradition (pp. 64–72). Mills's general point is that the racial contract "underwrites" the social contract, and he examines the thought of Hobbes, Locke, Rousseau, and Kant to demonstrate the racist underpinnings of their theories. In each case, however, the situation is far too complex to be adequately captured in the few short paragraphs Mills devotes to each.

Mills suggests that, for Hobbes, the state of nature is a real possibility only for nonwhites and is purely hypothetical for whites, due to the latter's greater rationality and "superior grasp of natural law" (p. 66). But since this contradicts everything we know about Hobbes, Mills must quickly retract the claim, and his position on Hobbes is therefore left unclear. Regarding Locke, Mills notes the contradiction between his just-war theory of slavery and his involvement in the slave trade and resolves it through "the supposition that Locke saw blacks as not fully human" (p. 68). This is pure

speculation for which Mills can provide no textual support and which is largely uninformed by the sizable literature on Locke's relation to the slave trade and its bearing on his political thought. Mills then offers the contentious suggestion that Rousseau sees Europeans as "intrinsically civilized" (p. 68) and that his "praise for nonwhite savages is a limited paternalistic praise, tantamount to admiration for healthy animals, in no way to be taken to imply their equality, let alone superiority" (p. 69). One might have thought that Rousseau's position is far more ambivalent than this suggests, and Mills simply does not say enough to establish the plausibility of this assertion. Regarding Kant, Mills argues that "The Different Races of Mankind" sheds important light on his moral and political theory, because it makes clear that, for Kant, full personhood depends on race and is reserved for whites. Here Mills is more persuasive, but he overstates his case by trying to connect Kant, without much discussion, to Nazi ideology (p. 72).

In all these cases, then, the discussion is inadequate. Though there may be racist elements in the thought of all these writers, Mills fails to show how the racism is *essential* to the overall theory and, therefore, does not establish that the racial contract *underwrites* the social contract. A much more extended and nuanced treatment is called for, and it might support Mills's overall position. As it stands, however, the discussion is at best suggestive, at worst misleading.

There is perhaps a more fundamental difficulty with the book, one related to its contractarian character. Those skeptical of contractarianism's justificatory power may be skeptical of its force as a critique as well. As with contractarianism in its positive, constructive mode, so, too, in its critical guise one must ask what is gained by speaking in terms of agreement and contract. Of course, the atrocities and racist policies that Mills cites occurred, and no doubt their legacies continue to shape our society and the world. But what is added to the account by the contractarian framework? It seems to raise more questions than it answers. For instance, there is some ambiguity as to who exactly are the parties to the contract. Mills suggests that the parties are whites (though not all whites [pp. 11, 107]), but sometimes he implies that nonwhites can be thought of as parties as well (pp. 25–6, 118). The content of the contract also is not clear, since it is not really one contract but several, and according to Mills it is constantly being rewritten and "has now written itself out of existence" (p. 130; but see p. 133). And Mills argues that the racial contract is an "historical actuality" (pp. 19–31), but of course it is not. Like all contracts posited by contractarian theories, it is a metaphor. All this seems to obscure rather than clarify the important normative issues raised by the racist history of our society and, therefore, undermines rather than advances Mills's project.

As a result, the book provides little guidance as to what is to be done. Mills provides only a few remarks about what he sees as the practical upshot of his analysis. He "does not see the ideals of contractarianism themselves as necessarily problematic" (p. 129; but whose contractarianism? Hobbes's?) and even calls the Kantian idea of the infinite value of all human beings "a noble and inspiring ideal" (p. 55). Yet, he rejects the idea of extending the social contract to nonwhites, at least not without first acknowledging the existence of the racial contract (p. 77). But beyond this acknowledgment, what is necessary to do justice? Mills offers, for example, no sustained argument for, say, reparations, either at the domestic or international level (but see pp. 37–40). And he is entirely silent on issues of culture. By focusing exclusively on the "material" dimension of white domination (p. 33), Mills has nothing to say about cultural imperialism. Since many of

the most salient racial and ethnic issues today are more cultural than material, the book is not as helpful as it might have been. (Perhaps the author's "antipostmodernism" [p. 129] contributes to a neglect of these issues.)

Despite these shortcomings, the book is highly suggestive and succeeds at being engaging and accessible. Though almost none of the issues it raises are treated with the depth they deserve, that this slim volume raises so many issues is itself an achievement. It is hoped the book will provoke much discussion which will further develop the arguments presented by Mills. If it does, Mills will have succeeded, even if the discussion is unlikely to take place within the framework he provides.

Liberalism and Its Discontents. By Patrick Neal. New York: New York University Press, 1997. 209p. \$40.00.

Emily R. Gill, *Bradley University*

Although Neal's book comprises a series of essays that have each appeared independently over the last dozen years, they fit together admirably and constitute a trajectory that raises important questions for liberals today. The liberal desideratum over recent years has been "to give an account of liberal order which shows it to be both inclusive of and fair toward all ways of life which themselves are willing to abide by the terms of fairness" (p. 163). Neal's project demonstrates, however, that theorists whose liberalism is full-bodied and vigorous maintain this vigor at the price of exclusiveness, whereas those whose liberalism is inclusive maintain the latter quality at the price of substance and vigor. Neal eventually opts for a more Hobbesian "vulgar liberalism," in which a rough equality of power among competing interests is a more necessary precondition for a stable liberal order than is an agreement among political philosophers on the terms of an elusive or even nonexistent overlapping consensus.

Neal begins by maintaining that governments, as part of the social fabric, cannot be neutral on the question of the good life for human beings. Therefore, even liberalism cannot maintain a privileged position above the fray of competing values but must be positively defended in terms of the preferences it produces. Liberalism in fact possesses a meta-theory of the good on an epistemological level. Because it is individuals who bear conceptions of the good and because these can only be contingently shared, liberalism displays a particular *conceptualization* of conceptions of the good, one that excludes those who, for example, espouse conceptions of the good which require its collective pursuit on the basis of essentially shared ends, as Sandel or MacIntyre advocate.

Rawls, of course, implies that his conception of justice as fairness, expressed in an overlapping consensus, threads its way between the horns of the dilemma of substance versus inclusiveness. It avoids controversial, comprehensive conceptions of the good which would exclude those who cannot subscribe to these, while it simultaneously eschews a *modus vivendi* which is "merely" prudential and without moral substance. But for Neal, "the theoretical ground which Rawls wishes to claim and occupy does not, in my view, exist" (p. 8). First, the farther we progress from the Kantian ethical conception of self-willed principle toward its actual political expression, the more closely we approach Rousseau's general will and the existence of communally determined constraints on this expression. Second, the farther we move from universalistic and metaphysical interpretations of justice as fairness toward empirical propositions about the self-understandings

of democratic citizens, the more closely we approach political interpretations that resemble Hobbesian prudence by imposing moral beliefs without moral justification on those who may not share them. Finally, the more "a-foundational" Rawls becomes in order to avoid consideration of the truth claims of comprehensive doctrines of the good, the more his bracketing of controversial issues as nonpolitical, and therefore off the political agenda, serves to settle the identity of political actors and interests in advance, thereby ironically excluding and freezing out persons and points of view from participating in defining the terms of the overlapping consensus.

To stem the bleeding of ethical substance, as it were, from liberal theory, we might turn, as Neal does, to the perfectionist liberalism of Raz. Although Raz views personal autonomy as a necessary part of a good life, he believes that autonomy must be directed toward the good to be valuable, and that public or state action must support perfectionist ideals if valuable options are to be preserved and if their validity is to be signified. Neal is disturbed, however, by Raz's apparent endorsement of reason over will, which effectively freezes the perspective of authority as "non-contingent and non-contestable" (p. 156) and valorizes social consensus over inclusiveness. And although Dworkin's later work purports to achieve both more vigor than Rawls and more inclusiveness than Raz, his conceptual innovations do not convince Neal that liberals can escape a choice between "Rawlsian minimalism . . . and Razian perfectionism" (p. 181). Thus, Neal concludes that "Hobbesian liberalism is defensible in its own right; liberals ought to let him out of the closet and affirm him as their own" (p. 186). It is unclear to Neal that the mere existence of a link between individuals' conceptions of the good and elements of the public conception of justice alone provides any particular motivation, moral or prudential, for the individual to adhere to the latter. A rough equality of power among groups, brokered by the state, and checks on the state's own potential domination seem more effective.

Neal's demolition of attempts in recent liberal theory to combine robustness with inclusiveness is clearly, skillfully, and even elegantly argued. He is not unsympathetic to those he critiques, and he admires specific facets of all these theories. I shall pose only one query of his project. Neal notes that retreat from the liberal desideratum is manifested by recent tendencies to see the value of autonomy as a particular or substantive conception of the good life rather than as a broader "point of access for choice amongst the competing substantive views" (p. 168), or what Will Kymlicka would call a context of choice. Later he classifies Kymlicka's project itself as an ideal-based model of liberalism, because it defends liberalism on the basis of an essential human interest in leading a good life. Although I would not suggest that Kymlicka's is a neutrality model of liberalism, to the extent that it is ideal-based, it is rooted in a particular *type* of ideal. The capacity for personal autonomy does provide a point of access or context of choice enabling us to examine and reaffirm or revise our current projects and goals, but it does not tell us what substantively constitutes the good life for us individually. Therefore, it functions as a meta-ideal, as it were. Because we will hold differing views on the good life and on the implications of these views for public policy, the evolution of a *modus vivendi* is still necessary. Moreover, the neutrality model, if viable, would also require adjudication among differing views of what constitutes neutrality.

Neal's *modus vivendi* model, then, may not be a separate model of liberalism, but it may instead represent a particular way of negotiating the conflicts arising from the instantiation of any *other* model. Just as Neal questions settling the identity

of political actors and interests in advance of political activity, I question establishing the content of ideals prior to the political process. Overall, Neal's book is provocative, raising crucial issues for all who are interested in liberal theory and practice.

The Art of Being Free: Taking Liberties with Tocqueville, Marx, and Arendt. By Mark Reinhardt. Ithaca, NY, and London: Cornell University Press, 1997. 234p. \$39.95 cloth, \$16.95 paper.

Michael Janover, *Monash University*

This impassioned and lucid book proposes to "take liberties" with the reading of three modern political thinkers in order to gauge degrees of fit and misfit between works of the tradition of political theory and a world in which traditional assumptions of congruence between politics and state collapse, and in which ideals of harmony between politics and moral community are found wanting. Indeed, if Reinhardt is right, political theory cannot evoke or presume a single, whole political world at all. In a condition of displacements and fractures, in which global aggregations of power are accompanied by disintegration of old identities, classic texts of political thought must be read in strange ways if we are still to learn from their depictions of the past and present and their imaginings of the future. Reinhardt argues that, if they are to mean anything to us, Tocqueville, Marx, and Arendt must be "read in the gaps" between the coherent worlds they project and the fragmented multiple worlds we now inhabit. Only then, through ironic interpretative acts of piracy and errancy, might we arrive at images and concepts of freedom and democracy informed by the past and formative of future possibilities.

For all its sense that the lamps of tradition need reorienting, or even rewiring, if they are to illuminate late-modern conditions, this book is at one with the theorists it reappropriates in believing that the activity of political thinking can transform the practice of politics. The theorists analyzed here (two chapters on Tocqueville, one each on Marx and Arendt) are powerful imaginative thinkers who weave conceptual forms and historical stories into nets of practical significance. In his fine, close readings of these "strong poets of the political" (p. 7), Reinhardt focuses on the forms, and deformations, of political space that their writings portray, suggesting that contemporary political thought and action can learn from their overlapping, though by no means identical, emphases on democratic practice and on freedom. In Reinhardt's view, the encompassing and world-mapping political theory that all three of these thinkers exemplify is always at risk of narrowly confining or evading the problems and potentialities of politics by virtue of the limits and lights of its own vision of what "the political" comprises and makes possible or impossible. This view, that the world mapped is the world made by figures and motifs of the theory, owes evident debt to the deconstructive strategies of literary theorists and philosophers of the last three decades, and it also echoes the yet older writings of Sheldon Wolin on the epic vocation of the political theorist.

In attending to the ways in which the theorists he reads contain and evade the possibilities of politics, Reinhardt plays a dangerous game. He wishes neither simply to represent their epic vistas nor to discard or dismiss them altogether. More fruitful understanding will flow from what Reinhardt calls "reading the gaps" (p. 23) of their treatments of public and private, freedom and despotism, democracy and plurality. The normative premise of this kind of reading,

and its criterion of the fruitfulness of understanding, is that it "issues a challenge to our own conditions of unfreedom and the imperfections in our democratic theories and practices" (p. 29). This is a work of zestful and bold critical theory. Reading the gaps in political theories and between those theories and ourselves means reading them resistantly and against the grain, but it does not mean reading them tendentiously so as to use reading as a weapon against them. In all three cases, Reinhardt's readings are close, sympathetic, rich but for all that, because of that, critical in the best sense. His are readings that work from inside Tocqueville, Marx, and Arendt to reveal tensions and frictions within their own concepts, idioms, rhetorics, and visions.

In Tocqueville's case (the most extensively treated and the one from which the marvelous title phrase, "the art of being free," is drawn) reading against the grain means criticizing Tocqueville's agrarian (grainy!), localist, racially, and sexually sequestered vision of the homogeneous (Puritan) cultural basis of American democracy, while affirming Tocqueville's enthusiasm for the enactment of freedom through democratic association. This means taking from Tocqueville the idea of the energy of public political action as the key resistance to the growth of tutelary powers (or what Foucauldian readers will call disciplinary apparatuses) but resisting Tocqueville's sense that such action can exist only where class differentials are low or absent and where the actors share the same civic and cultural (white, male, American) identity. The difficulty with this exciting and exacting reading is that once the Tocquevillean prism of a homogeneous civic public is shattered to make way for multiple publics/identities and for the "radical democratization of cultural power" (p. 60), it is hard to see what the basis of mutual dialogue and collective action will be, short of sheer interest or an implied commonality beneath the multiplicity, which simply reposes the problem of Tocqueville's "(con)founding" of democracy (pp. 59–63).

A similarly polarizing and resistant reading is brought to bear upon Marx, who is seen to provide, sometimes in the same text, two contending conceptions of "freedom as transcendence" (of politics) and "freedom as a political practice" (pp. 95–6). Drawing upon readings of Marx (especially the *Manifesto* and the *Eighteenth Brumaire*) that develop the literary tropes and rhetorical strategies through which Marx invents and discovers the actors, the spaces, and the stakes of the politics of class conflict, Reinhardt shows how Marx's theory and dramaturgy of history are undermined by his own accounts of the ironies and uncertainties of political events, personae, and masks. This surely helps to reclaim Marx as a political theorist, but Marx himself does little to illuminate or substantiate any sense of "freedom as a political practice." Whenever he adumbrates shapes of politics as theater or gesture, as unexpected forms and transformations of class representation, he recollects these moments into the philosophically (over)wrought and politically undertheorized (depoliticized) container of History.

The reading of gaps, tensions, ambiguities in the thought of Arendt proceeds once more by locating a bifurcation between differing conceptions of politics in her work. On one side are the pure but empty politics of agonistic action, and on the other side the less pure, more substantial, politics of claims, interests, and solidarities which emerge from the cases of worker-councils and revolutionary moments and which serve Arendt as ideal types of the politics of action. Reinhardt's key move is to bring Arendt's own image of action (as disclosure of identity and as speech-deed of innovation) to life within spaces that she consigned to the depoliticized register of "society." This transposition of the

forms of politics onto the contents of spheres formerly conceived as unpolitical matches Reinhardt's earlier suggestion that Tocqueville's democratic association be transposed to the register of culture. Both moves open up possibilities of thinking toward a cultural politics of identities. Such a politics remains outside the boundaries of "the political" for both Tocqueville and Arendt, and it is subordinated to the politics (and identity) of class by Marx. One great merit of this thought-provoking book is that it opens new possibilities for political thinking without abandoning the rich conceptual and imaginative resources of these three thinkers of politics as democratic association, as unique but public action, and as social transformation.

The Political Consequences of Thinking: Gender and Judaism in the Work of Hannah Arendt. By Jennifer Ring. Albany: State University of New York Press, 1997. 358p. \$34.50 cloth, \$22.95 paper.

Lisa Disch, *University of Minnesota*

Jennifer Ring's fine new study of Hannah Arendt deserves a broad audience for, among other reasons, its astonishing thesis: Hannah Arendt thought as a Jew and was received as a woman. Why should this be astonishing? The simple reason is that many of Arendt's more recent readers have meekly obeyed her instruction not to interpret her public writings in light of what she took to be the private matter of her identity. Ring's book defies Arendt, and that alone makes it interesting. In addition, in Ring's words, it is a "compassionate" work that offers an intellectually and politically engaging portrait of Arendt as "a conflicted Jewish intellectual" (p. 237).

In Part One, Ring takes a wholly original approach to Arendt's *Eichmann in Jerusalem* by situating the text in the politics of the two communities that criticized it: New York intellectuals and the Israeli leadership. Whereas members of the *Partisan Review* crowd attacked Arendt's detachment to atone for their own "cosmopolitanism," in Israel the report played into a crisis of legitimacy. Ben Gurion needed the trial to redeem himself from a double indictment: that he had done too little for Holocaust victims during the war and that he had been "soft on the Germans" afterward (p. 84). Ring maintains that an "unacknowledged gender factor" also fueled the conflict over the Eichmann report (p. 170). Leaders in both communities "felt not only guilty and powerless about their responses to the Holocaust, but 'unmanned' by the power of the Nazis and what appeared to be the collusion of most of the Western world in the face of the slaughter of the European Jews" (p. 111).

To defend this controversial statement, Ring draws on George Mosse's analysis of the gender logic of modern nationalism, which allows her to explain Jewish male anxiety as a response to being cast as nationalism's effeminate outside. Drawing, in turn, on the work of Daniel Boyarin, Ring argues that this anxiety also has a psychic source: circumcision. An "emasculating wound" that reminds the Jewish male he cannot measure up to the (gentile) phallus, circumcision produces the compensatory response of aggressive assertion of gender difference and national difference (p. 122). (Note that Ring does not explain why circumcision would provoke fears of Jewish inadequacy in postwar America, where gentiles were routinely circumcised). In this context, Zionism provided for the assertion of national difference; Talmudic scholarship, with its "inherent and pervasive male bias," reaffirmed the immutability of gender difference (p. 252). By her dispassionate criticism, Ring contends that Arendt destabilized the nationalist and gender binaries that

these two communities used to shore up their anxious Jewish masculinity. Her criticism of the Eichmann trial was “tantamount to cross-dressing”: “For the Israelis she was the ‘strong Jewish woman’ from the Diaspora, a combination they had not believed possible. For the New Yorkers, she was a Jewish woman who presented herself as a universal scholar” (p. 155).

With these arguments, Ring pioneers a way of thinking about the Eichmann text that moves it beyond well-worn debates about the nature of evil and into the politics of the current impasse over the Oslo agreement. The work is original, drawing on a body of scholarship that is both surprisingly (the material on Israeli politics in the postwar period) and predictably (the cultural critique of nationalism, Judaism, and sexuality) beyond the typical purview of Arendt scholarship. By her use of the cross-dressing metaphor, however, Ring brings to light an ambiguity in her account of Arendt’s crime. Was it that Arendt “usurped” the masculine position (p. 170)? Or was it her “dismantling” of the very oppositional structure on which categories such as masculine identity and national sovereignty depend (p. 155)?

Although Ring wants to credit Arendt with “the deconstruction of accepted categories,” she has represented the “‘problem’ of Jewish masculinity” in a way that is at odds with this broader objective (pp. 170, 139). Briefly, Ring’s attribution of Jewish male anxiety to a transhistorical imperative to “escape the stigma of femininity” presupposes that the boundaries between masculinity and femininity are static and that the challenge is to measure up to the phallus, thereby earning a place on the privileged side of the divide (p. 128). Feminist critics of psychoanalytic theory (such as Jacqueline Rose, Judith Butler, and Joan Scott) have observed that to equate “the phallus” with male power—as Ring does, apparently following Daniel Boyarin—is to reconfirm a stereotyped understanding of gender from the start. To these scholars, the phallus represents not an intimidating ideal of sovereign manhood but the impossibility of certainty regarding who one is in a linguistic and social system in which all meaning is relational and eludes closure. By contrast to those who persist in assigning a gender to the phallus, this view deconstructs the phallus as the paradigmatic instance of meaning-in-opposition: It is the precondition of the binary conception of gender that underwrites our stereotypes. Recourse to a deconstructed phallus might put Ring’s argument about Arendt on firmer ground, so to speak. That she relies on a more literal understanding in no way diminishes her important contribution to Arendt scholarship, however. This is the first single-authored book that even opens up the possibility for this kind of argumentation by defying the proscription against studying gender as a factor in Arendt’s life and writing.

Ring’s point of departure in Part Two is the widely noted contradiction in Arendt’s *Thinking*, the project she undertook to elucidate the theoretical commitments implicit in her widely misunderstood catchphrase, the “banality” of evil. It was Arendt’s intuition that political evil occurred when people stopped thinking; consequently, thinking is and must be a worldly activity. Ring argues that Arendt’s last work is “conflicted”; although she attempted to conceive of a kind of thinking that would enrich and be enriched by public life, Arendt could not relinquish the rarefied model of thinking as a solitary, pure activity that is an inheritance from Plato (p. 237). Ring advances another controversial thesis to explain this conflict: She speculates that it “may have reflected a conflict within Arendt, between the political Jew and the intellectual German” (p. 215).

Using Thorlief Bowman’s treatise, *Hebrew Thought Com-*

pared to Greek (1960), Ring schematizes the competing models of thought that she claims are at odds in Arendt’s last work. She demonstrates that although there are affinities to dynamic and dialogical Jewish thinking in such works as *The Human Condition* and *Thinking* (which have no explicitly Jewish subject matter), Arendt’s inability to give the Jewish aspects of her thought freer play doomed her quest for a worldly philosophy (p. 215). Ring contends that the reason for this inability was twofold. As a woman, Arendt could not have had access to “the exclusively male culture of the Talmud and Torah” (p. 36). Moreover, as a Jewish scholar trained in the German academy, she was “perhaps seeking ‘parvenu legitimacy’ in ways in which she was unaware” (p. 237).

Ring’s argument in Part Two is well conceived, illuminating, and delightfully risky. Her portrait of Arendt as “a conflicted Jewish intellectual” gives contemporary Jewish scholars a point of identification with Arendt, affording them a more sympathetic way into her work than was previously available (and anyone who doubts the need for such a project should read the entry on Arendt at the Holocaust Museum in Washington, DC). Although the book is probably a calculated appeal to this foreclosed Jewish audience, I nonetheless wish that Ring had provided some discussion of the rationale behind a formulation that occurs repeatedly throughout Part Two. She chooses to characterize the tensions in Arendt’s final work as testimony to “a divided loyalty between Arendt’s Jewish soul and her German education” (p. 229; similar formulations at pp. 9, 215, 234, 259). By assigning priority to the fact that Arendt was Jewish, Ring’s formulation discounts the fact that Arendt was also German, thereby erasing the fact that Arendt grew up in a Germany where it was possible to be both German and a Jew. After the war, Arendt sometimes acknowledged what an oddity it was to be something—a German Jew—that Nazism had practically rendered a contradiction in terms, but she allowed the puzzle that this identity posed to persist undecided. Although it may not be a flaw of Ring’s study that she settles the question, the dialogic style that Ring prizes and exemplifies would be enhanced by some elucidation of her rationale.

Far from being—as Ring puts it—“another book about Arendt,” this is a genuinely new study that Arendt specialists should read. Ring’s writing makes it so lively as to appeal to newcomers as well.

Spinoza, Liberalism, and the Question of Jewish Identity. By Steven B. Smith. New Haven, CT, and London: Yale University Press, 1997. 288p. \$30.00.

George M. Gross, *Temple University*

Benedict de Spinoza (1632–77) was a major figure in the formation of liberal political thought and in the emergence of the historico-critical study of the Bible, but the eclipse of liberal republicanism in continental philosophy under the influence of Romanticism caused his contribution to appear as a theory of pantheism. Spinoza scholarship has yet to recover from this disfigurement. Now Steven B. Smith seeks “to establish [Spinoza’s] stature as a political theorist first and foremost” (p. xv), observing that “Spinoza’s [*Theologico-Political*] *Treatise* is perhaps the least read work of political theory by a philosopher of the first rank, no doubt because it is overshadowed by the *Ethics*” (p. 13). One part of Smith’s intended audience is the philosophy professors who stake a proprietary claim to Spinoza, but Smith directs his book mainly to political theorists in order to supply a pivotal, missing chapter in the history of liberal thought.

Smith wants to show that "Spinoza was passionately political" (p. xv; cf. p. 32), but not too political. Neglecting Spinoza's other mature work, the *Political Treatise*, Smith pronounces that Spinoza's theory of sovereignty "seems radically opposed to the Lockean notion of limited government or the *Federalist's* scheme of constitutional checks and balances" (pp. 197–8); the view that "Spinoza favored a separation-of-powers doctrine with a considerable degree of pluralism . . . seems false to me" (p. 249, n97). Yirmiyahu Yovel and Harvey C. Mansfield, Jr., offered versions of this reading in the 1980s. Lewis Feuer and Robert McShea sketched contrary views in the 1950s and 1960s, but incompletely. The Spinoza controversy today in part concerns each of these issues.

Anyone who relies on the Smith-Mansfield-Yovel reading would be surprised to learn that Spinoza defines in constitutional terms what it is to execute (*exsequi*). Spinoza also contends that if two share political power, the polity is likely to fracture into two polar factions. But, Spinoza says, "the factions will be weaker, the more there are to whom the dominion [is] delegated" (Spinoza, *Political Treatise*, chap. 8, sec. 1, Elwes tr.). A more limpid statement of the reason for political pluralism under constitutional government is hard to find. Smith recognizes that the constitutional encouragement of a proliferation of sects or factions is the hallmark of "the pluralist strategy" (p. 3), but he misses Spinoza's articulation of this strategy in the *Political Treatise*. In the *Ethics*, Spinoza employs "what was to become a standard stratagem of liberal political theory . . . by playing off one passion against another" (p. 129). Smith does not explore the linkages between the "standard stratagem" and "the pluralist strategy." Because philosophically he is predisposed to find new evidence of nuclear individualism in liberal theory, he misses the opportunity to establish Spinoza's pertinence to American political theory in the most direct way, maintaining instead that "Spinoza's form of liberalism is individualist but not pluralist" (p. 154).

How, then, is Spinoza political? He is significant for "his theology of the liberated individual" (p. xiii) and as a supporter of "the democratic republic because it is the regime most consistent with the autonomous individual or the liberated self" (p. 122). The liberated individual merges in Smith's narrative with the liberal citizen of the liberal polity (cf. p. 20), who is unmindful of the gap between the few and the many and, indeed, forgets the many, along with their fears and hopes. The premise of the book is thus that contemporary religion "caught liberals unawares" (p. 1). Smith turns to Spinoza as a progenitor of these bland, autonomous liberals. After characterizing liberalism's conception of liberty and civil peace as a Faustian bargain, because it is soulless, and as "something like an offer to buy the Brooklyn Bridge" (p. 22), because its promise of peace is chimerical, Smith concludes that it is "the worst solution except for all the alternatives" (p. 205).

Smith's second thesis, a subsidiary argument on account of how he develops it, is that "Spinoza provides us with an alternative route to liberalism by way of Judaism" (p. 23). That is, "the Jewish Question," famously associated with Karl Marx, already had received a full delineation in Spinoza's *Theologico-Political Treatise*; Enlightenment and nineteenth-century thinkers understood that not only Spinoza's writing but also his life epitomized this question. Thus, liberalism has its origins not just in religious wars or in the rivalries of Protestant sects, but in the issue of Jewish emancipation, an intrinsic concern of liberal political doctrine from the beginning. Smith rightly observes that Spinoza's excommunication by the Jewish community of Amsterdam in 1656 continues to

be controversial and "can be seen as a virtual litmus test" for dilemmas posed by emancipation (p. 167). Unfortunately, Smith's tendency is to vindicate the Jewish community of Amsterdam. Spinoza's position that the hereditary priesthood is not intrinsic to Jewish law (cf. pp. 149–50) is a radicalization of republican tendencies within Judaism, and while it may ultimately be heterodox (cf. Exodus 19:6), this reviewer thinks that the verdict on Spinoza is closer than Smith pronounces.

As an inquiry into the origins of phenomena that Smith wants to understand, this reviewer would recommend Oakeshott's analysis of the "autonomous individual" (and of the "anti-individual"), which is more textured ("The Masses in Representative Democracy," in Michael Oakeshott, *Rationalism in Politics and Other Essays*, 1991). Smith's idiom is often Nietzschean. While Oakeshott speaks of "conditions so preeminently favorable to a very high degree of individuality" and which favored choices by Hobbes and Spinoza as to which human dispositions to cultivate and encourage, the idiom of Smith's reading is that Spinoza is a kind of alchemist (e.g., pp. xiv, 51), or a sorcerer's apprentice. Some time in the remote past, Oakeshott's thesis on the "autonomous individual" may have been a motivation for Smith's study, but that past is forgotten now.

Smith's reconstruction of the multifacetedness of Spinoza's readership in chapter 2 is good, but it is unnecessary for him to invoke Leo Strauss's esoteric writing thesis. Strauss is germane in the succeeding chapters on the religious sociology of Spinoza's Scriptural hermeneutics. Smith shows that Spinoza advocates disarming clericalism and taming religion from the perspective of the civil state, but his emphasis on Spinoza's rhetoric leads him to be overly cynical about Spinoza's Biblical exegesis, some of which is fertile and interesting.

Liberal political theorists may find Smith's volume useful as an introduction to Spinoza. There are disappointments, however. Smith's neglect of Spinoza's constitutional theory is partly due to his following the lead of scholars whose aim was not, after all, to interpret Spinoza's political thought. Smith repeats the possibly true (but too easily asserted) dictum that "the liberal paradigm . . . begins with Locke," while showing that elements of liberal thought are present in Spinoza's thought (p. 164); when one adds elements of liberal thought that are present in Spinoza's thought and that Smith overlooks, as well as the signature concept of the *homo liber* himself, one is outside the compass of Smith's discussion.

In sum, this reviewer finds that the lapses in Smith's account of "Spinoza's form of liberalism" are not incidental. Smith does for the "friends of liberalism" what J.G.A. Pocock and Eco Mulier (writing in the 1980s) did for the "civic republicans": He shapes Spinoza according to preconceived ideas. In writing a sequel (pp. xvi, 252, n7), some autonomy could be helpful.

Machiavelli's Three Romes: Religion, Liberty, and Politics Reformed. By Vickie B. Sullivan. DeKalb: Northern Illinois University Press, 1996. 249p. \$30.00.

Benedetto Fontana, *Baruch College, CUNY*

Machiavelli's treatment of religion has sparked numerous controversies and debates among his interpreters. Some, like Hulliung and Parel, see Machiavelli as a pagan, while others, like de Grazia, regard him as a Christian. Still others, like Germino, see ambiguous and ambivalent nuances in a religious view that is still fundamentally Christian. At the same time, whether or not Machiavelli sees religion as an instru-

ment of rule, and thus subordinated to the needs and demands of politics, is yet another contentious issue:

Vickie Sullivan's book is an important and useful contribution to this literature. It combines meticulous scholarship with provocative and insightful analysis. While issuing directly from this literature, and thus in a sense the intellectual heir of these debates, it attempts to overcome their dualistic character by presenting an alternative and original interpretation. In a manner reminiscent of Machiavelli himself, Sullivan uses the arguments of her forerunners precisely in order to subvert them. She argues, with Skinner, Pocock, and others, that a central strand of Machiavellian thought is liberty and its embodiment in political institutions. Yet, she also maintains, with Strauss and Mansfield, that Machiavelli's attack on Christianity is a fraudulent pretense devised to veil his use of Christian methods of rule. Sullivan shows how the use of pagan religion not only undermined liberty in republican Rome but also provided the necessary political and social elements for the emergence and triumph of Christianity (pp. 66–77, 147–8). Although pagan religion led to the tyranny of the caesars (pp. 81–2, 114–7), biblical religion produced a far more formidable tyranny in the rule of Christianity and its political and institutional embodiment in the papacy and clergy (pp. 49–55).

In the process Sullivan provides a novel and intriguing perspective to both the Straussian and civic republican interpretations of Machiavelli. Running throughout Sullivan's reading, just below the surface, yet emerging at various points in her argument, are the traditional Machiavellian themes of political order and political liberty, the relative utility of fraud and force, the autonomy of politics, and, most important, the strife and competition for power between the few (the "great") and the many (the "people"). It is the desire of the people for the unseen and imaginary goods promised by religion (generated by ambitious "potential tyrants") that destroys constitutional order and republican liberty. Conversely, order and liberty are attained and maintained by transforming the "transcendent" hopes and fears inspired by religion (whether Christian or pagan) into those of a worldly and political kind.

In effect, two major themes carry the argument forward. First, since Machiavelli's thought is neither pagan nor Christian, but instead incorporates in his project to reform the world a vision of politics informed by elements taken from the pagan and Christian worlds, Sullivan stresses the temporal and earthly nature of this enterprise. Second, against the "almost universal view" that religion is a useful and necessary instrument of rule, she maintains that to Machiavelli it is both "pernicious" and "wholly superfluous" (p. 7). Religion is dangerous precisely because tyrants and "potential tyrants" will use it to destroy liberty; and it is superfluous because a more useful and more reliable remedy is at hand. Religion invokes fear of the gods, politics fear of human beings. Like the Epicureans, Machiavelli "intends to free" humankind from the fear of the gods; but unlike these philosophers, who retreat from the problems and cares of the city into the private life of contemplation, Machiavelli "shuns philosophy in the name of politics" (p. 11). Fear of the gods is replaced by fear of the prince. The nature and role of fear is central to Sullivan's argument: She moves from fear of the gods, to fear of the prince, to the mutual fear of ambitious and contending leaders ("potential tyrants"). The foundation of liberty is thus a balance of mutual and reciprocal fear. The relation between fear and *virtù* is important, and an extended discussion of its historical and intellectual lineage, in Sallust and Augustine, for example, would have been fruitful (especially

since the author underlines the similarities and parallels in method between pagan and Christian Rome).

Sullivan deftly weaves together the question regarding religion as a political instrument used by the rulers (the few) to dominate and control the people (religion as *religio*) with the problem regarding religion as belief or transcendent faith (*fides*). In so doing, she argues that Machiavelli's "new modes and orders" are the outcome of a pagan critique of Christian Rome and of a Christian critique of pagan Rome. Using the *Prince*, the *Discourses*, and the *Florentine Histories* as her main texts, Sullivan discerns in Machiavelli three cities: pagan Rome (discussed in Part II), Christian Rome (Part I), and Machiavelli's Rome (Part III). Unlike the first two Romes, the third exists entirely in Machiavelli's political and historical imagination, which is itself the product of a selective and critical reading of pagan and Christian thought and practice. Machiavelli's third city is a synthesis of antagonistic yet parallel elements drawn from the two cities of pagan and Christian Rome. But to say that this third Rome is imaginary is to recall Machiavelli's famous critique of those who have "fancied for themselves republics and principalities that have never been seen or known to exist in reality" (*Prince*, p. 15), which is thus a subtle and tacit use of Machiavelli's method against him. Machiavelli, like prophets and religious reformers, also seeks to entice the many with things unseen and lands unknown.

Religion and Contemporary Liberalism. Edited by Paul J. Weithman. Notre Dame, IN: Notre Dame University Press, 1997. 315p. \$48.00 cloth, \$23.00 paper.

Robert Lowry Clinton, *Southern Illinois University at Carbondale*

These 11 papers were presented at an interdisciplinary conference at the University of Notre Dame in February 1995. As Paul J. Weithman notes in his introductory essay, the central theme of the collection is the effect of what has been called the liberalism of reasoned respect upon religious argument and religious activity in the public forum. Found in the works of John Rawls, Robert Audi, and others, this variant of liberalism asserts that establishment and maintenance of a just and well-ordered society demand that constitutional arrangements and public policies, broadly defined, be based only on "public reasons." Public reasons are those reasons to which all citizens may be expected reasonably to subscribe, at least in the pluralistic Western democracies that have accepted the "settlement" ending the wars of religion in the wake of the Protestant Reformation. This settlement featured the transfer of religion from the public to the private sphere, emphasizing individual freedom of conscience and church-state separation. The resulting religious pluralism means that public reasons cannot be religious reasons because, by definition, such reasons are "plural" under religious pluralism. These considerations have profound implications for the conduct of public political discourse today.

Some of these implications are spelled out by Audi in the essay that follows Weithman's introduction. Audi argues that the liberalism of reasoned respect requires separation not only "between religious institutions and the state" but also "between religious and secular considerations" (p. 38), and he sets forth principles of "secular rationale" (p. 55), "secular motivation" (p. 56), and "ecclesiastical political neutrality" (p. 64). The first two principles, read together, assert that one is obligated "not to advocate or support any law or public policy that restricts human conduct" unless one has, is willing to offer, and is motivated by "adequate secular reason" (pp.

55–6). The third principle holds that churches in a free society are under an obligation not to support candidates or policies that restrict human conduct.

Audi's "gag rule" is both applied and qualified in the essays by Sanford Levinson and Martha Nussbaum. Levinson argues that judicial nominees may appropriately be disqualified unless they satisfy the appropriate confirmation committee that they will resist "the temptation to treat religious sources as containing any privileged statements of moral truth" (pp. 91–2), but he stops short of extending the gag rule to nonjudicial public officials, politicians running for office, or citizens generally. Nussbaum, emphasizing the rights of women in an international context, suggests that something like the liberalism of reasoned respect should be extended globally in order to ensure fundamental human rights for all persons. To this end, Nussbaum argues that systems of religious law like those in force in Iran, Pakistan, or the Sudan should not be permitted (p. 121), that "any form of religious discourse that constitutes a threat of violence against an individual or group" should be criminalized (p. 131), and that it should be regarded as immoral "to speak in ways that contradict or undermine" fundamental rights (p. 133).

The remaining essays in the collection challenge, to one degree or another, the ideas presented by Audi, Levinson, and Nussbaum. Philip Quinn denies that there are "moral duties to refrain from appealing to religious reasons" in political contexts (p. 139), because, on such important issues as that of abortion, secular reasons are simply not strong enough to establish a fair consensus (p. 150). Nicholas Wolterstorff suggests that the strictures placed on public argument by proponents of secular reason are self-contradictory because they show disrespect for persons who do not choose to divide their lives "into secular and religious components" (p. 176). For Timothy P. Jackson, the liberalism of reasoned respect, even in its best formulations, may pose a larger threat to "genuine pluralism" than religion poses (p. 184).

The last four essays in the collection travel beyond the argument about the liberal silencing of religion in the public square to broader concerns. J.L.A. Garcia argues that the extensions of liberal freedom in the final third of the present century, particularly sexual freedom, demonstrate the moral bankruptcy of a liberalism devoid of metaphysical or religious foundations (p. 221). Jean Elshtain argues that religious faith is an essentially public, not private, activity (p. 253), and "much of the ongoing debate that poses religion against liberalism is a distraction from, rather than a contribution to,

our grappling with the crisis of authority in late modernity" (p. 263). The theme of a "public church" is echoed by John A. Coleman, who, on the basis of extensive field research of his own and the work of such scholars as Robert Putnam, concludes that active, public religious activity is needed to strengthen civil society. According to Coleman's analysis, the main problem with a liberalism that excludes religion from the public square is that "discipleship" is a stronger motivator than "citizenship" (pp. 290–1). Thus, if liberals really want to strengthen civil society, feed the hungry, clothe the poor, and heal the sick, they will need to make common cause with religious institutions. Finally, David Hollenbach closes the volume with a plea for liberals to stop focusing on the conservative Christian Right and pay more attention to the Christian Left, which he claims has been slogging away in the trenches all along.

There is much that is valuable in this collection. Readers who are interested empirically in the role of religion in public affairs will find the essays by Coleman and Hollenbach especially rewarding. Readers interested in more general theoretical discussions of religious involvement in civil society will enjoy the essays by Jackson and Elshtain. Those who want to access the ongoing debate between Rawlsians and religionists over the exclusion of religion-based arguments from public political discourse will find no better introduction than the essays by Audi, Quinn, and Wolterstorff. Those who want to explore the implications of liberalism for legal policy, global human rights, or social mores will learn from the essays by Levinson, Nussbaum, and Garcia.

It is characteristic of collections of this kind that they tend to suffer from the defects of their virtues and make for difficult reviewing. Promising initially to center upon the relation between religious and political discourse, the volume loses this focus about two-thirds of the way through, and the essays take off in various directions, each shaped by the diverse proclivities of the individual contributors. So while much ground is covered, the reader is left to wonder whether real progress has been made in resolving the issue that spurred the conference in the first place. As Weithman says in his introductory essay, the discussions in the collection seem to show that the relationship between religion and liberalism is far more complicated than usually imagined, and that the view of many contemporary liberal thinkers—that an "unbridgeable gulf" exists between the two world views—is seriously mistaken. But that depends on what "liberalism" really means; and the collection of essays presented here does not suggest that this question is likely to be answered anytime soon.

American Politics

Making Crime Pay. By Katherine Beckett. New York: Oxford University Press, 1997. 158p. \$27.50.

William E. Kelly, *Auburn University*

The effects of crime on American society are quite interesting for the serious student of our criminal justice system. They cause a government to react in a variety of ways that are both praised and criticized by a public which experiences the negative aspects of crime. This is understandable, because no solution to the problem is acceptable to all of us. In fact, the many attempts made to combat crime have not been successful in eliminating it, and perhaps that is a major reason its

role and effects are of so much interest. In *Making Crime Pay*, Katherine Beckett contributes a valuable analysis.

A main point of this work is that the public's perception of crime is more a result of the rhetoric emanating from politicians than of crime itself. This interesting view is well documented by an abundance of sources. It leads to a number of important and interesting contributions, such as the capacity of the media and politicians to set the political agenda of this country. Once that agenda is established, it is easy to ascertain why public policy reflects a particular value system. Beckett suggests that the political agenda is established by politicians who see much more personal value in alluding to the existence of crime in our society.

This book makes a number of substantial contributions to

the study of American crime. It begins with historical background on how certain types of politicians and law enforcement personnel used the civil rights movement to justify an increase in law-and-order programs. The author also identifies the effects of the increased political rhetoric advocating the need for more criminal justice sanctions. Specifically, she draws attention to the reallocation of public funding from welfare services to social control goals, such as increased incarceration. She also examines the growing trend among the general public to support more crime control policies, such as increased authority of the police, prison construction, and harsher sentences in terms of both length of imprisonment and types of punishment.

This book is valuable for a number of reasons. It shows that crime is very important to an aspiring politician in gathering public support. Advocating a strong law-and-order position often is quite successful because the public has been led to accept a need for it. The book also explains some of the factors behind the huge increase in public funding for the criminal justice system in the hope that this will somehow reduce crime. There has not been much resistance from taxpayers, who have been exposed regularly to political rhetoric about the danger from criminals among us.

Beckett also calls attention to the fact that certain individuals associated with the criminal justice system benefit from its expansion and increased public support. Aside from jobs for law enforcement and correctional personnel, she notes benefits to the private sector, such as privatization of prison management. She believes the penal-industrial complex will continue to support expansion of public funding on crime control for its own financial gain. Beckett could have given more emphasis to the fact that even higher education is a beneficiary of the increased spending, since criminal justice personnel are encouraged to upgrade their credentials.

This work does an excellent job of demonstrating the huge influence of the media in our society. As Beckett suggests, the media may not tell people how to think, but they are very important in giving them something to think about. Another important lesson to be learned from this book is that when politicians use the media to call our attention to crime, we can expect more resources to be devoted to it. This also implies that certain segments of our society will benefit, and others will probably suffer. As noted earlier, when more public resources are shifted to crime control, the social welfare sector pays part of the cost.

This book should be of interest to several different groups. It will give those who work in the criminal justice system a better idea of what to expect in the near future about the views of the general public regarding crime. It also will be of value to students of the criminal justice system and the role of crime in our society, because it will help them understand how and why our government is responding to this serious social problem. Finally, for students of the political system, it shows how politicians exploit an issue of public concern and use the media to further their own objectives.

Fortress America: Gated Communities in the United States.

By Edward J. Blakely and Mary Gail Snyder. Washington, DC: Brookings Institution Press; Cambridge, MA: Lincoln Institute of Land Policy, 1997. 209p. \$24.95.

John McGeady, *Purdue University*

America's social fabric has begun to rip. Our sense of public community and citizenship, or *civitas*, is fading. As we fragment as a nation, we have become more privatized, atomized, and localized, and as a result we are losing our

ability to envision, let alone secure, the common good. With these statements, Blakely and Snyder join a host of scholars, journalists, and politicians who have sounded the alarm of civic decay in recent years. What establishes *Fortress America* as an original and valuable work, however, is the authors' focus on what they claim to be a dramatic and important manifestation of this civic decline: the rise of the gated community.

Blakely and Snyder argue that gated communities reflect the social fragmentation and civic atrophy currently plaguing our nation. Their argument has two general thrusts. First, gated communities greatly limit social contact among members and groups of society. Lower classes are excluded not only from living in these residences (through prohibitive housing costs) but also from even casually passing by. And, the authors note, such class separation is often de facto racial segregation. This loss of social contact and interaction between different classes and races is "narrowing the bonds of mutual responsibility and the social contract" (p. 139). Such social distance can lead to stereotyping and misunderstanding between societal groups, which in turn lead to mistrust, fear, and a further weakening of the civic bonds among Americans.

Second, gated communities are characterized by a form of "private" government: homeowner associations. Because the normally public space within the community has been rendered private by gates and walls, these associations assume responsibility for such services as policing and maintenance of streets, parks, and recreation facilities, and they have the power to levy fees to pay for them. This privatization of local government, according to Blakely and Snyder, is leading to what Robert Reich has called the "secession of the successful." The affluent members of gated communities are questioning whether they should pay taxes for public programs and services which no longer benefit them. For many in gated communities, social connection and sense of common interest end at the walls of their residence; thus, they abdicate any responsibility for less fortunate members of society. Such secession, Blakely and Snyder argue, is poisonous to a society and democracy based on mutuality and collective citizenship (see Robert B. Reich, *The Work of Nations*, 1991, or Evan McKenzie, *Privatopia*, 1994).

This social fragmentation and secession need not be the future of American communities, according to the authors. There are ways to assuage the fear of urban and social decay that drive some into gated enclaves and to reinforce the inclusive and broad systems of community that are the bedrock of society. In the final chapter, the authors detail what they feel are three promising approaches: a set of security measures called Crime Prevention through Environmental Design (CPTED), neotraditional urban design, and more comprehensive and integrated urban development planning on the regional level.

Fortress America has much to recommend it. It is the first book devoted entirely to the study of the gated community phenomenon, the social and political ramifications of which should not be taken lightly. Blakely and Snyder estimate that three million households are already living in such developments (p. 2), and according to one expert, eight out of every ten new urban developments are gated (p. 7). The authors develop a helpful typology of gated communities (lifestyle, prestige, and security zone), and they exhaustively explore these types, and the motivations of their residents, in three respective chapters.

Blakely and Snyder also do well to characterize the phenomenon of gated developments as not a desperate and dramatic revolution in community design but, rather, as a

logical, evolutionary step in the suburban ideology of territorial control. Features of community design widely accepted as standard around much of the country, such as single-use zoning, cul-de-sacs, inaccessibility to public transit, and housing market segmentation, all reflect this ideology of privatization and exclusion. Yet, the authors note, gated communities are unique and warrant special attention: For example, they provide a very visible and powerful symbol of exclusion to people on both sides of the walls and gates.

One weakness of the book is its data. Although Blakely and Snyder collect an impressive array of ethno-descriptive and statistical evidence, including site visits, focus groups, interviews, and surveys, ultimately little of it is very illuminating. For example, in a survey of gated community board members, the authors found that "only 6 percent reported that residents were 'very active' in governance" (pp. 132-3). How does one judge this percentage without the equivalent rate for nongated communities? Furthermore, what is considered "very active" may well differ greatly from one board member in one community to another. These and other research flaws detract from the authors' otherwise persuasive arguments.

Elsewhere, Blakely and Snyder strangely back off from their central argument. Repeatedly, they state that gated communities are not a cause of the social fragmentation that is weakening our sense of public community but simply a manifestation of it (pp. 3, 156). This is an odd statement, since the authors also argue that gated communities "allow some citizens to secede" (p. 3), "create . . . barrier[s] to interaction" (p. 153), may "lead to stereotyping and misunderstanding" (p. 138), and "may be reinforcing people's fear" (p. 150). These statements imply some degree of causality. Indeed, implicit throughout the book is the idea that, though prior fragmentation and civic disconnection prompted the gated community trend, these developments through their ecological effects have become a contributing cause to the perpetuation and exacerbation of this social breakdown.

Finally, Blakely and Snyder raise some fascinating questions that deserve attention. To what extent is the growth in gated communities being driven not by consumer demand but by housing developers? Do gated residences represent a growing commodification of housing and community itself? Do they, and their homeowner associations, embody a societal trend of ceding forms of social responsibility to professionals to the detriment of community? And is our need for others in society lessening?

Fortress America is intended for a wide audience, and so a political scientist will be slightly disappointed in its superficial treatment of these theoretical issues. This aside, Blakely and Snyder have produced a thought-provoking first look at the civic dimensions of the gated community phenomenon. Though they provide few answers, the authors ask the right questions and lay out the terrain for future inquiry.

The Other Elites: Women, Politics, and Power in the Executive Branch. Edited by MaryAnne Borrelli and Janet M. Martin. Boulder, CO: Lynne Rienner, 1997. 265p. \$55.00.

Susan J. Carroll, *Rutgers University*

As scholars of women and politics have gained a stronger foothold in the discipline of political science, most aspects of American politics have been examined through a gendered lens. The presidency is one of the few major areas of research to have largely escaped such scrutiny, in part because a woman has never held the nation's highest office and in part because relatively few feminist scholars have focused their research on the executive branch.

The Other Elites is the first comprehensive attempt to examine executive branch politics from a gendered perspective. This pathbreaking anthology, which bridges the fields of presidency studies and women and politics, illustrates the relevance and importance of gender as an analytic category for examining presidential politics. The contributors include several established scholars in the field of women and politics. They examine the increasing presence of women in positions of influence in the executive branch, analyze the politics surrounding their appointments and the context in which they serve, and assess the ways in which gender has influenced relations between the executive and other branches of government as well as public perceptions related to the presidency. Most of the analysis in this volume draws upon and blends together the insights offered by both traditional studies of the executive branch and the growing literature on women and politics.

The Other Elites evidences both the strengths and the weaknesses one might expect in a first attempt to expand research into a new area. On the one hand, it covers many different aspects of presidential politics, presents stimulating new information and analyses, and offers original and memorable insights. On the other hand, the chapters are uneven in quality, some essays fit the volume less well than others, and a few critical aspects of presidential politics receive little or no attention.

The book is divided into four parts. The first section places the study of women in the executive branch in both a theoretical and comparative context. Georgia Duerst-Lahti's essay provides an overall framework for the volume, showing the many ways in which masculinism as an ideology undergirds power relations in the executive branch. Her analysis helps to illuminate why women are considered the "other elites" and suggests several important hypotheses regarding the appointments women are most likely to hold and the obstacles they are likely to confront in the executive branch. Piper A. Hodson's interesting analysis of women prime ministers in South Asian countries functions less well in establishing a context for the essays that follow. Despite Hodson's commendable effort to make her analysis appropriate for a volume focused on U.S. politics, her examples of women whose powerful family connections figured in their rise during times of great national instability in Third World countries have only limited relevance for the United States.

The second section, which is the most clearly focused and arguably the strongest, examines women as political appointees. Janet M. Martin presents empirical data on the background and career paths of women appointees and provides a very useful overview of the rhetoric and records of recent presidents regarding their appointment of women. Through a detailed examination of the early Clinton administration, MaryAnne Borrelli analyzes the politics surrounding the appointment of presidential cabinets in a climate in which women and people of color are making increasing claims for representation. Kathryn Dunn Tenpas examines the presence and influence of women on the White House staff since the Roosevelt administration, documenting the persistent glass ceiling that excludes them from the president's inner circle. Finally, Nancy E. McGlen and Meredith Reid Sarkees examine the inclusion of women in the foreign policy establishment during the Reagan, Bush, and Clinton administrations. They argue that presidential direction, appointment practices, and policy management style all influence the role that women play in shaping foreign policy.

The essays in the third section focus on two of the many relationships between the presidency and the other branches of government: the confirmation process in the Senate and

appointments to the federal judiciary. Jean Reith Schroedel, Sharon Spray, and Bruce D. Snyder present a case study of the Senate confirmation of Roberta Achtenberg, the first open lesbian to be appointed to a top federal position, as assistant secretary of fair housing and equal opportunity in the Department of Housing and Urban Development. Richard L. Pacelle, Jr., whose essay has much in common with those in the second section, analyzes the appointment of women to federal judgeships and highlights the contributions of Jimmy Carter and every subsequent president in increasing the presence of women in the federal judiciary.

The final section examines women as executive activists and as citizens. It includes an excellent essay by Barbara C. Burrell on the role of the First Lady as an adviser to the president and as a policymaker in both foreign and domestic contexts. Burrell explores the contributions of First Ladies and the questions surrounding their accountability. In his second contribution to the volume, Pacelle assesses the role of the Office of Solicitor General as played in litigation involving affirmative action and abortion. Finally, in a broad-ranging essay on the gender gap in public opinion, partisanship, and voting behavior, Clyde Wilcox reviews relevant survey data and research findings on the electorate's willingness to vote for a woman for president and voter perceptions of women candidates.

The individual essays in *The Other Elites* are not as interrelated and clearly focused on central themes as one might like. For example, despite the fact that Duerst-Lahti provides a fine theoretical framework for thinking about the gendered nature of executive branch politics, few of the essays refer to her concept of masculinism even when it is clearly relevant. In addition, the reader will find many subjects missing from this book. For example, no chapter focuses on women campaign staff or the way that gender influences decision making in presidential campaigns. Similarly, there is little attention to the actual influence on public policy or decision-making processes of women civil servants or appointees in the executive branch. Nevertheless, in an area of so little research, Borrelli and Martin have provided a strong foundation on which future scholars can build.

The Other Elites would be a very useful supplemental text in courses on the presidency and women and politics. Consequently, the decision by the publisher to issue this book only in a cloth edition is puzzling. It is hoped that an affordable paperback version will be published for classroom use.

Overall, this volume represents an excellent initial effort to show the relevance of gender for analyzing various aspects of executive branch politics. Borrelli and Martin are to be commended for recognizing and responding to the need for a comprehensive examination of the presidency from a gendered perspective. It is hoped that many scholars will follow their example and devote increasing attention to analyzing the multifaceted ways in which gender is important for understanding presidential politics and the executive branch.

Justice Antonin Scalia and the Conservative Revival. By Richard A. Brisbin, Jr. Baltimore, MD: Johns Hopkins University Press, 1997. 474p. \$39.95.

Sue Davis, *University of Delaware*

Books on sitting justices of the Supreme Court have grown more common in the last ten years with the publication of works examining the judicial decisions of William H. Rehnquist, Sandra Day O'Connor (e.g., Nancy Maveety, *Justice*

Sandra Day O'Connor: Strategist on the Supreme Court, 1996), and Antonin Scalia (e.g., David A. Schultz and Christopher E. Smith, *The Jurisprudential Vision of Justice Antonin Scalia*, 1996). As Richard Brisbin has conceded, publishing a book on a sitting justice "is a dangerous proposition" because the justice may veer in a new direction at any time (*Law and Politics* book review, May 1997). Nevertheless, there is a high level of interest in current justices. Studies of individual justices, whether present or past, are important insofar as they provide information about the work of a single justice. The best of those studies, however, go farther by providing a framework that promotes an increased understanding of judicial decision making. As I shall explain, Richard Brisbin's book is just such a study. Brisbin's analysis of Scalia's voting behavior and his interpretive analysis of the justice's opinions is comprehensive. It includes the cases in which Scalia has participated in the areas of separation of powers, federalism, equal protection, the First Amendment, the rights of the accused, reproductive rights, and property. If the author merely provided an empirical analysis of Scalia's votes and reviewed a large number of his major opinions, he would make a solid contribution to the literature on sitting justices. The analytical framework that Brisbin has developed enables him to go considerably farther, however.

Brisbin sets forth his framework by offering three propositions about Scalia's behavior on the Court. First, his votes advance his conservative political ideology. Second, in his opinions Scalia employs a mode of jurisprudential discourse, reasoned elaboration (briefly, judges should follow the rules of law devised through a lawmaking procedure defined by the democratic majority and should use traditional modes of judicial decision making established by precedent), to buttress his conservative attitudes and provide legal doctrines for the future. Third, Scalia's constitutive discourse evidences his assumption of the legitimacy of the rule of law.

Brisbin assesses the first proposition with an analysis of Scalia's voting behavior, which reveals that he is the second most conservative member of the Court overall, although he is less conservative on federalism and taxation issues. Proceeding with a thorough examination of the justice's opinions, Brisbin demonstrates that Scalia has usually adhered to the principles of reasoned elaboration. He has departed from the mandate of judicial passivity in the face of majoritarian decision making, however, in order to prevent the expansion of interest group participation and moral discord. Or as Brisbin explains, Scalia has rebuilt reasoned elaboration to serve contemporary conservative political objectives. Thus, Brisbin manages to resolve several familiar inconsistencies in Scalia's decisions. For example, although he is committed to judicial deference to legislative decisions, Scalia has voted to strike down legislation that protects disadvantaged minorities (see, e.g., *RAV v. St. Paul* and *Austin v. Michigan Chamber of Commerce*). After examining Scalia's opinions in the area of equality, Brisbin speculates that the justice has "simply expressed a political vision hostile to governmental action against racial and gender subordination" (p. 180). More specifically, as Brisbin points out, Scalia has transvalued the strict scrutiny doctrine, using it to defend powerful groups rather than the disadvantaged specified in the *Carolene Products* footnote. Similarly, the positions that Scalia has taken in First Amendment cases illustrate how he has attempted to reduce the legitimacy of discussion and actions that promote difference and alternative visions of the political future of the regime. Indeed, Brisbin argues that Scalia's opinions call into question the value of dissent against decisions of the state.

Brisbin is at his most creative and critical in chapters 9 and

10, which are devoted to demonstrating his third proposition. He explains how Scalia's opinions reflect his commitment to the rule of law—a predictable guide for social and political behavior—and to the politics of modernity (particularly individualism and reason). But it is all an artifice, Brisbin claims, for Scalia's decision making endorses the vision of American politics favored by the conservative revival: "executive policy leadership and a reinforcement of the status of interests that are already powerful" (p. 325). Although his framework and analysis provide plausible explanation of Scalia's decision making, Brisbin is unlikely to have the last word. In light of the continuing interest in Scalia's work on the Court along with his relative youth, it is reasonable to expect that the future will bring a number of studies of the justice's decision making from a variety of perspectives. Nevertheless, Brisbin's insightful examination sheds considerable light on the way that several factors, including an ideological agenda, a political philosophy, and a legal methodology, converge to shape Scalia's votes and opinions. A coherent, understandable Scalia emerges. When all the analysis is complete, however, Brisbin's Scalia remains consistent with the attitudinalists' Scalia insofar as the driving forces behind the justice's decision making are ideological, founded on his conservative vision of American politics.

Brisbin's framework has potential beyond the present study of Justice Scalia. Not only is it likely to be useful for analyzing Scalia's future votes and opinions, particularly if he appears to take a new direction, but also it might be used to examine the decision making of other justices. Especially promising in this regard is the way that Brisbin juxtaposes Scalia's reasoned elaboration against pragmatic liberalism. The contrast might provide the framework for comparing the decision making of two or more justices. Likewise, the Warren Court's pragmatic liberalism might be contrasted with other approaches that capture the jurisprudence of the Burger and Rehnquist Courts. At any rate, Brisbin's framework clearly provides an important addition to the growing body of literature that uses a variety of methods to understand judicial decision making.

The International Origins of the Federal Reserve System. By J. Lawrence Broz. Ithaca, NY: Cornell University Press, 1997. 269p. \$35.00.

Andrew J. Taylor, *North Carolina State University*

For J. Lawrence Broz, the sources of the Federal Reserve Act of 1913 can be found in the internationalization of the American economy. Rather than suggest that the Fed's foundation furthered solely the interests of the money center banks, Broz argues that, to a large extent, the Federal Reserve System provided critical public goods in the form of a stable payments infrastructure that was to make regular financial panics a thing of the past. This is not to say that New York banks were conspicuously absent during the formation of the Federal Reserve Act. Indeed, Broz does not question the conventional wisdom that such banks did the heavy lifting in the policy process. But he does reject James Livingston's influential argument (*Origins of the Federal Reserve System*, 1986) that rent-seeking Wall Street forced the legislation on Congress so as to increase the entry barriers for state-chartered banks that wished to be competitive. Broz shows, for example, that the act neither altered the right of banks to choose between state and national chartering nor removed the extant statutory obstacles to branch banking that were so ferociously protected by the small banks.

Why, then, did the big national banks work so hard? The

answer, Broz writes, is that the Federal Reserve Act unleashed the process of internationalizing the dollar. The U.S. dollar already had the potential to be one of the few currencies of international commerce in 1913. The U.S. economy and share of world trade were growing rapidly. There existed, however, critical domestic institutional impediments to internationalization. The establishment of the Fed removed these barriers by (1) iterating the nation's commitment to price stability through adherence to the gold standard and (2) creating more sophisticated discounting and entirely new rediscounting mechanisms that were to provide the requisite liquidity in U.S. financial markets. New York banks especially benefited from internationalization of the dollar by collecting the commissions and fees that go along with the issuance of international currency and by saving the transaction costs that accompany the conduct of international commerce in foreign money. This story is, for the most part, quite new.

Broz wraps his argument in a theoretical approach that borrows heavily from the thinking on collective action by Mancur Olson. Whereas Livingston, for instance, conceptualizes the Federal Reserve Act as an example of the "privileged group" model of policymaking, Broz talks of a "joint products" approach. The latter framework better explains the legislation because, "by conjoining private benefits with the production of public goods, central bank charters internalized a portion of societywide benefits within a subset of the community, creating incentives for these individuals to demand and supply institutions that had wider social benefits" (p. 246).

The book unfolds in six substantive chapters that, among other things, describe the content of the Federal Reserve Act, explain the internationalization of currencies, mark the growth of the U.S. economy, reveal how banking interests lobbied for the legislation, and apply the theoretical framework to the founding of other central banks, such as the Bank of England. A detailed explanation of Broz's theory in an introduction and summary act as bookends to these chapters.

This is all intelligent and interesting stuff. There seem to me, however, to be two major weaknesses. The first is that Broz is too enthusiastic about the theoretical contribution of the book. The "joint products" model is advertised as qualitatively different from the usual exchanging of specifically targeted rents for pressure exerted by a self-interested and narrow private concern. But is this really the case? The difference between the two approaches could easily be seen as one merely of degree. Broz's story could be construed as the empirical vindication of a variation on the "privileged group" theory—the very theory he rejects. Here, the "public good" of a stable payments system could be interpreted as part of the rents received by large private banks because it is inextricably linked to the pay-off of the internationalization of the dollar. Just because others benefit from policy change does not mean that it cannot be viewed primarily as favoritism to a particular sector. After all, tax breaks and subsidies to individual industries also benefit those members of the public who happen to be their customers. No one is particularly puzzled to find out that consumers did not lobby for the industry's special treatment, however. What is more, I do not think the model is particularly unique. Economic actors will often support government policy aimed at promoting the public interest—perhaps literacy or an antihunger program. Their support is often linked to desired rents through a process of logrolling with other interests or politicians. Healthy public relations, as well as the received rents, make it worthwhile to internalize costs unrelated to private gain. All this makes me feel that Broz's most valuable contribution

is empirical rather than theoretical. The international connection is of most interest in this book, not the spin on Olson.

My second criticism is that Broz's explanation for the Federal Reserve Act is far too sociocentric. In many ways, therefore, this is another dig at his theoretical approach. To be sure, chapter 5 describes the statute's experience through the tortuous legislative process in Washington, but for the most part Broz has a "black box" understanding of American government. The burgeoning political development literature surely provides new avenues by which to explore theoretically interesting explanations of the Fed. How did the legislation fit into the systematic expansion of federal administrative practices that was occurring at the time it was passed? It seems to me that the Fed is an integral part of this pattern. Instead, Broz revisits the well-trodden path of political change propelled by private interest. He also fails to examine the important issue of delegation. Why did Congress decide to create an agent—and a fairly autonomous one at that—to make critical monetary policy? I wonder if it is possible to answer such provocative questions with Broz's "international" argument.

All in all, *The International Origins of the Federal Reserve System* is an extremely interesting, assiduously researched, and well-written book. It uncovers valuable and new information connected to the establishment of the Fed. I recommend it unequivocally for all students of international and American political economy as well as those who are interested in the creation and development of political institutions.

Bitter Harvest: FDR, Presidential Power and the Growth of the Presidential Branch. By Matthew J. Dickinson. New York: Cambridge University Press, 1996. 267p. \$49.95.

Joseph A. Pika, *University of Delaware*

Analysts of presidential staffing and presidents themselves have long ignored the administrative strategy of Franklin D. Roosevelt. Among academics, the prevailing consensus holds that Roosevelt's system of "competitive ad hococracy" (p. 205) was enormously inefficient. Generalist advisers, cabinet secretaries, generals, and admirals were pitted against one another in a system of overlapping, frequently shifting assignments that increased the flow of information to the president and preserved his decision-making options but created disorder and frustration arising from his "ad hoc, divide-and-conquer administrative style" (p. 197). Through their actions, presidents have seemed no less critical. In place of Roosevelt's kaleidoscope of structures and advisers has arisen a markedly larger advising system characterized by staff specialization, expanded policy expertise, and substantial hierarchy. This detailed study of Roosevelt's administrative strategy seeks new insights into how contemporary presidents might derive better service from their advisers by emulating FDR's practices. Dickinson argues that mobilizing the economy, conducting a world war, and preparing for the postwar world were enormously complex tasks that were no less challenging than the environment confronted by contemporary presidents.

Central to Dickinson's argument is the contention that contemporary presidential advisory systems fail to enhance presidential power. The large, functionally specialized, White House-dominated advising system of the post-Roosevelt era—the "presidential branch"—exhibits inherent flaws that are illustrated through a case study of the Iran-Contra affair. In contrast to Roosevelt's small group of White House generalists, whom he personally supervised in their perfor-

mance of tasks designed to meet his needs for information and expertise (and thereby reduce his bargaining uncertainty), modern presidents incur "insuperable management costs" (p. 9) in overseeing an army of aides or, as in Iran-Contra, suffer from failing to do so.

Dickinson demonstrates that Roosevelt's administrative strategy, far from being a direct reflection of his personality or the transfer of techniques developed during his prepresidential career, evolved during his presidency, a reflection of trial and error (e.g., his early experiments with cabinet coordinating committees), conscious design (his consultation with the Brownlow Committee), and evaluation of his recurrent needs (the enhanced responsibilities of the Bureau of the Budget). While most accounts of FDR's management approach emphasize the New Deal period, Dickinson pushes beyond to a close examination of Roosevelt's use of staff following passage of the 1939 Reorganization Act and the implementation of a new staff system, which consisted of both personal and institutional components. In confronting his wartime tasks, FDR resisted repeated appeals by aides, generals, the Congress, and observers to streamline his administrative practices by appointing a mobilization czar, to creating a White House-centered economic and policy staff, naming a war cabinet, and unifying the military services under a single chairman. His rejection of these suggestions, argues Dickinson, enabled FDR to protect necessary bargaining resources and to delegate carefully delimited authority to a quintet of particularly important aides without jeopardizing his constitutional power. This quintet included Justice James Byrnes, who left the Supreme Court to head the Office of War Mobilization and effectively became the "assistant president on the home front" (p. 149); Harry Hopkins, whose influence on foreign policy rivaled that of the secretary of state when his oversight of munitions and Lend Lease extended into international diplomacy; Admiral William Leahy, who chaired meetings of the Joint Chiefs of Staff as the president's liaison with the military; Judge Samuel Rosenman, who joined the White House staff to oversee political and legislative issues; and Harold Smith, Bureau of the Budget director, who became an indispensable institutional resource. Even in coming to rely more heavily on this critical group of aides, Roosevelt resisted official titles, based their authority on executive order rather than statute, and ensured that they preserved his own bargaining resources.

To most students of presidential staffing, Dickinson's study will be provocative but unconvincing. Like Roosevelt himself, Dickinson values bargaining advantage over efficiency, a perspective explicitly derived from Richard Neustadt's classic *Presidential Power*. Despite acknowledging the flaws in Roosevelt's strategy (pp. 77, 220), Dickinson regards his performance as effective, an evaluation that is far from universally endorsed. It is possible, in fact, that FDR succeeded in achieving the nation's wartime goals *despite* his administrative style rather than because of it, and that those same goals could have been accomplished at a lower cost and more effectively had the president been less concerned with preserving his options. Dickinson offers ample evidence that many of Roosevelt's most loyal contemporaries had deep reservations about how he chose to perform the nation's most critical tasks.

Also, it is not clear how readily any of FDR's successors could have replicated his administrative strategy. The effective use of competitive ad hococracy may require a virtuoso performance by a president with exceptional political skills. Operationally, such a system runs the risk of presidential overload—burdening a president with an excessive volume of immediate decisions, a factor that many have suggested

affected Roosevelt as well. Moreover, following Roosevelt's example would be likely to create an even more personalized presidency than now exists, at a time when many believe the presidency should be built down not up. In fact, excessive personalization is precisely the complaint that led to the construction of post-war advising structures in economic and foreign policy, areas in which FDR's previous dominance was regarded as dangerous.

Revisionist interpretations of Eisenhower's management practices have now become a staple in the literature. Dickinson's study may well inaugurate another round of reexaminations focused on FDR. Although Dickinson urges future research to cull for additional cases of presidents who may have used FDR-like techniques (chap. 9), it is much more likely that this study will trigger future research into the Roosevelt record with a new appreciation for the management lessons likely to be revealed.

The Color of Politics: Race and the Mainsprings of American Politics. By Michael Goldfield. New York: New Press, 1997. 404p. \$19.95.

Mamie E. Locke, *Hampton University*

Studs Terkel has argued that race is the "American obsession" that permeates every facet of our social existence. There are not many issues that one can discuss which do not have race at the root of the discourse, whether the debate is about the criminal justice system or welfare reform. Michael Goldfield uses this conception of race as the springboard for an analysis of the role of race in guiding and shaping the American social and political system.

Goldfield begins the analysis with a general discussion of race in the United States, arguing that it has been at the center of major turning points in the nation's history. This focus on race is never more pervasive than during periods of economic downturn. The frustration and resentment are not targeted at those who manage and benefit from the economy, however, but at explosive and intangible issues like affirmative action. Like many hot button issues, affirmative action is one of those concerns for which a real, viable solution (e.g., finding jobs) is never addressed. Instead, minority groups are scapegoated as being the cause of the problem. Goldfield further posits that race rhetoric in political campaigns in the recent era is reminiscent of the Jim Crow period. This racial animosity is often accompanied by moral righteousness. The author finds the parallels and the continuous focus on race as paradoxical and asks why such tactics work. To answer this and many other questions, he begins with an historical analysis of race in an effort to bring clarity and understanding to the current role it plays in the American polity.

The introductory chapter discusses very briefly a variety of theories on race, ranging from biological assumptions to ignorance. Goldfield argues that these theories cannot be fully understood without a clear analysis of the class and economic roots of racial formation and systems of racial oppression. He selects five critical periods (turning points) in American political development to explain the genesis of the social and political system of racial subordination that undergirds racial thought in the contemporary period. The periods highlighted in following chapters are the colonial era, Revolutionary War/constitutional era, Civil War/Reconstruction era, Populism period, and the Depression/New Deal era. In each period, Goldfield discusses the relationship between race and class in shaping the particular movement and the subsequent responses to the disruption and transformation of American social, economic, and political life.

The period that follow these turning points (post-World War II, civil rights movement, and white racist coalition building) builds on the lessons from the time preceding it. In each of these defining moments of American history, there has been a failure to combat racism in any meaningful way through the development of substantive policies designed to promote racial equality. According to Goldfield, race has had a significant effect on governance and how various races and ethnic groups, particularly blacks and whites, interact with one another. Since colonial times race has been central to the outcome of any struggle. Resolutions to these struggles have altered social and political relations, leading to new arrangements of social control and a reorganized system of racial domination and subordination.

Goldfield's underlying hypothesis is that white supremacy is the reason for the inability of workers in the United States to develop and sustain class organization and consciousness. He argues that the system of white supremacy has also played a central role in all the critical turning points of U.S. politics. This is a main thesis and continuing thread throughout the fabric of the book. Goldfield claims that the development of the system of white supremacy and the ideology used to justify it originated from and is based in the socioeconomic system. The principal function of both the system and the ideology has been to control and exploit the labor of African Americans and other nonwhites as well as to control white workers in order to isolate them from potential allies. Hence, white supremacy and chauvinism have prevented the development of a sustained, solidaristic, class-based labor movement.

Goldfield continues to support this theme by arguing that white supremacist ideology and beliefs have been institutionalized through many economic, political, and ideological supports. It has been "the failure to recognize the importance of white supremacy and the unwillingness of white workers, white labor leaders, and white radicals to confront it head on [that has] been a primary factor in keeping workers from organizing on a class basis," (p. 31). Even when class consciousness and organization have blossomed during any given movement, the commitment to the fight against racial discrimination has been at the top of the political agenda, not class struggle.

If one is to understand the major structure of the race question in the United States, then there must be an understanding of the demand for exploitable labor. The thread connecting this demand is the relationship between race and class. The early characteristics of race relations and servitude in the colonial period set the tone for much of the early labor struggles. White supremacy and racial slavery were developed because they advanced the most powerful economic interests in the colonies. Racist theories of black inferiority and racist attitudes were used to justify a system of racial domination and subordination that gave power and profit to white southern plantation owners. Race was also used as a barrier to prevent oppressed groups from uniting with natural allies. For example, plantation owners, as a mechanism to control the white working class, used poor whites as overseers and slave patrollers to subordinate blacks. Aspects of these racist theories and attitudes remain in contemporary society.

While such overt violence as lynching and brutal murders of blacks and white supporters of biracial causes has disappeared, the pattern of violence continues in other forms: church burnings, vigilantism, and right-wing terror. In the current era, the colonial concept of "free, white, and twenty-one" and the privileges attached to it is alive and well. Those embracing the concept believe that they have a moral right to racial preferences over nonwhites in every venue. As Gold-

field points out, "the racist ideology that defined Black people as biologically inferior and socially undesirable was developed to justify Black slavery. This racist ideology, in new and contradictory forms, evolved, developed, amplified, and amended, lives on in America today" (p. 48).

Goldfield has written an easy to read, informative book assessing the role of race in the political and social development of the United States. He does so through an historical examination of critical periods of the nation's history as well as an assessment of the labor movement and the lack of the formation of a lasting multiracial labor coalition. He draws parallels from the historical period to the current one. He admits to being circuitous in his approach, and this is the major shortcoming of the book. He restates many historical events in each era that are rather cliché, and in some instances he states the obvious. He uses a variety of secondary sources whose arguments are quite familiar to readers. While many of these authors (Beard, Foner, DuBois) are certainly notable, there is nothing new in their arguments, nor does Goldfield add anything new. He also makes the argument that race has been a central feature of U.S. politics to the point of overkill. The repetition of this theme disguises the underlying theme of race overshadowing class issues. His book is equally a discussion of labor relations and the barriers that have thwarted working-class solidarity.

Despite these limitations, the book has value in its linking of the historical development of the subordination of African Americans to the current white racist coalition building, with its blame-the-victim approach to problem solving. His message that diversionary tactics have been used to avoid addressing the real causes of injustice and inequality in the United States is quite noteworthy. The fact that the system has failed to develop substantive policies to eradicate the scourge of inequality underscores the institutionalization of racism. In Goldfield's view, "white people's attitudes will only be changed substantially on racial matters when a determined group that is uncompromising and relentless on the issues, proselytizes, organizes, and refuses to go away" (p. 462). This group should be composed of both genders and various races and ethnic groups. Then, and only then, will a just and equitable society be created.

African American Women and the Vote, 1837-1965. Edited by Ann D. Gordon, with Bettye Collier-Thomas, John H. Bracey, Arlene Voski Avakian, and Joyce Avrech Berkman. Amherst: University of Massachusetts Press, 1997. 217p. \$45.00 cloth, \$15.95 paper.

How Long? How Long? African-American Women in the Struggle for Civil Rights. By Belinda Robnett. New York: Oxford University Press, 1997. 256p. \$35.00 cloth, \$18.97 paper.

Carol Nackenoff, *Swarthmore College*

This monograph and a collection of essays effectively argue that to treat gender in the history of African American struggles for political equality one cannot just "add women and stir." Rather, to incorporate women, new methods and new theorizing are required. As the essays make clear, existing paradigms fail to appreciate the heart and scope of the experiences of African American women and the intersectionality and simultaneity of struggles around race, sex, and class. These new works follow in the tradition of Paula Giddings (*When and Where I Enter*, 1984), offering greater historical depth and guidance on recovery of primary source material. Both books contribute to their stated goals of discovering and learning more about black heroines in the

struggle for political equality and citizenship. Robnett and several authors in *African American Women and the Vote* go farther and contribute importantly to the project of retheorizing.

How Long? How Long? is a very impressive and theoretically rich piece of scholarship by sociologist and women's studies scholar Belinda Robnett. A chapter rethinking social movement theory and one on theoretical conclusions frame the book, with the rise of the civil rights movement in the South and its ultimate unraveling from below by 1966 marking the progression of Robnett's story. Most chapters add fresh insights to understanding the formal organizations, formal and informal leadership, and grassroots mobilization of the civil rights era. Robnett finds complex interactions and offers an exceptionally vivid and compelling specification of the way regional culture, race, gender, class, and education shaped leadership possibilities, roles, and experiences.

Robnett has drawn on a rich treasure of interviews with movement participants, including open-ended telephone interviews with 25 women she conducted from 1990 to 1992. The narratives of movement participants are beautifully and seamlessly woven into the analysis. The interview data allow her to make good on her goal of avoiding essentializing categories, instead relying on "narratives to express the identities of the actors in question and define their own social locations" (p. 5). She generally moves with ease among engagement with the scholarly literature, frames of analysis, and the interview materials. There are, however, points at which the reader may dread seeing the term "bridge leader" (with its four variants) or the terms primary and secondary formal leader one more time.

How Long? How Long? remodels and redefines leadership, combatting scholarship that has failed to see women's participation in the civil rights movement as leadership. Robnett demonstrates the importance of methods that do not define leadership on the basis of formal titles, prominence in organizational records and newsletters, or even frequent speaking at meetings. Titles, she argues, generally fail to reflect women's authority in this movement. Women with formal titles were likely to be relegated to secretarial functions in the office. Women without titles, who worked in the field, often had considerable autonomy to lead, considered themselves leaders, and were recognized as such (sometimes as charismatic leaders) by their co-workers and by those they mobilized. In contrast to the assumption that leaders mobilized followers, Robnett argues that women leaders in the community frequently recruited and mobilized male formal leaders.

Though cultural and societal norms established some limitations on women's formal leadership, Robnett finds the lens of gender discrimination inadequate for analysis of women's roles. "The exclusion of most women from formal leadership positions created an exceptionally qualified leadership tier in the area of micromobilization" (p. 191). They bridged formal organizations and the grassroots. Bridge leaders, many of whom were women, were critical to building and sustaining grassroots mobilization. Their mobilization skills built the base on which the civil rights movement rested. They helped forge political consciousness and group solidarity in the African American community. Their own courage and willingness to put their lives in danger in moments of crisis and leadership breakdown mobilized via emotion—a vital component of movement recruitment and mobilization, Robnett argues. At the time, these women did not (by and large) experience the limitations on their formal leadership opportunities as gender discrimination. Especially in those organizations that were least hierarchical, women were able

to lead in ways they had never done before, and they felt their empowerment. In the early years of SNCC, people "leaped out of" prescribed roles (p. 194). "Ironically, it is this 'now' perceived limitation that served to catapult and sustain the identity, collective consciousness, and solidarity of the movement" (p. 191). Since bridge leaders provided the glue that held the movement together, when it unraveled, it was from the grassroots up. New hierarchical arrangements, emphasis on male leadership, and black nationalism in SNCC pushed bridge leaders and the agendas of their Southern grassroots followers (voting rights, jobs, health care) off the screen.

When dealing with charges and perceptions of sexism in the movement that date from that time, Robnett is inclined to dismiss them, which is at first glance unsettling but upon greater reflection quite nuanced. One example will suffice. She considers at length one 1964 paper produced by two white women charging SNCC with gender discrimination, and her argument stresses positionality. She points out that white women were more likely to work in the office than their African American counterparts (among other reasons, their presence in the field could endanger the lives of black activists), and they therefore experienced more traditionally gendered divisions of labor than field workers. The complex nature of the relationships among gender, class, and race again appears.

Robnett examines women's activism in the NAACP, CORE, SCLC, SNCC, Mississippi Freedom Democratic Party, the Women's Political Council of Montgomery, and the Montgomery Improvement Association, noting that leadership opportunities for women varied with the level of centralization in the organization. The portrait of Martin Luther King is not very flattering. King was reluctant to capitalize on grassroots victories and energy in this period, totally unwilling to imagine women as leaders, and deaf to their counsel and ideas. If Robnett is enthusiastic about the early years of SNCC, she nonetheless acknowledges that SNCC could not have taken the road to empowerment it did unless there was at least one other movement organization (e.g., SCLC) that engaged the state and made compromises (p. 195). In these organizations, male leaders frequently had to deal with the white power structure. "The women were not faced with the pressures of national credibility and the need to compromise" and therefore had the luxury of remaining more true to their constituents (p. 165). The author is partial to those women leaders least willing to yield or compromise their own visions, including Ella Baker, Fannie Lou Hamer, and Gloria Richardson (featured on the dust jacket), whose work was undermined by male leaders.

African American Women and the Vote is a collection of essays written chiefly by historians and African American studies scholars, growing out of a 1987 conference held at the University of Massachusetts Amherst. In revising the papers, authors incorporated a few later contributions to scholarship. Several essays that frame their arguments for the simultaneity of race and gender struggles, as opposed to giving precedence to one or the other, retain a mid-1980s flavor.

The volume is organized chronologically, charting key turning points in the political activity of black women. It begins with the first antislavery convention of American women and ends with the civil rights struggle in the 1950s and 1960s. An express goal is to lay the groundwork for a comprehensive political history of African American women. It is a project of historical recovery and, as Bettina Aptheker suggests, empowerment and self-esteem.

Despite the title's emphasis on the vote, another important goal of the book is to challenge and expand traditional definitions of politics. To look only at suffrage, from which

many African American women were excluded during many of the years under scrutiny, is to miss or miscalculate the actual power wielded by African American women. As Terborg-Penn points out in an overview essay, suffrage was "merely one seam in the fabric of women's political struggle" (p. 20). Several essays illustrate "the independent initiatives by black women toward establishing a power base in the community from which to assert greater influence and control over issues crucial to their daily lives" (Aptheker, p. 206). Essays, case studies (including black female legal challenges to emerging Jim Crow statutes), and examinations of the activities of particular black feminist leaders (Frances Ellen Watkins Harper, Charlotta A. Bass) display the rich variety of political concerns of female African American activists.

Several essays offer far richer insights and fertile theoretical reformulations than the rest. Cynthia Neverdon-Morton's essay on southern African American women's organizations from 1895 to 1925 is noteworthy for highlighting the important community-building role played by rural women involved in social service programs, for emphasizing the frequent flow of information and influence from local organizations and activists upward, and for examining possibilities and limits in interracial cooperation within women's organizations. The special standouts in this volume are the essays by Evelyn Brooks Higginbotham on clubwomen and electoral politics in the 1920s and, most notably, Elsa Barkley Brown on southern black women's political history from 1865 to 1880.

Too frequently, the 1920s are cast as a decade in which women's mobilization collapsed after their Nineteenth Amendment victory. Higginbotham's northern urban African American clubwomen had a strong sense of political efficacy and saw themselves as in politics to stay. In the 1920s, organized African American women played a significant role in mobilizing voters; they engaged in door-to-door canvassing and talked and held meetings on political issues of concern to the community. In African American communities increasingly differentiated along class lines, clubwomen prepared women for citizenship. Like Neverdon-Morton, Higginbotham traces the fate of fledgling alliances with predominantly white organizations, here the League of Women Voters.

Elsa Barkley Brown's dazzling essay on the immediate post-Civil War years is a remarkable example of what placing African American women at the center of the analysis can do to retheorize citizenship struggles. For these newly freed women, husband, children, and community at large were bound up with their vision of autonomy; "individual freedom could be achieved only through collective autonomy" (p. 69). African American women did not understand freedom, citizenship, representative institutions, or property in the same individualistic and market-oriented terms that their northern liberators employed. Their worldview involved an ethos of mutuality; members of the community were responsible for one another. An example of this differing vision of citizenship finds African American men and women thronging to early state conventions and legislative sessions, expecting not just to watch but to participate alongside delegates. Women refused to remain passive spectators. African American women saw themselves having a vital stake in the male franchise, considered the vote a collective good, and imposed sanctions against African American males who dared to vote Democratic. "That African American women did not operate inside the formal political process does not negate the intensely political character of their actions" (p. 86). Barkley Brown persuasively reminds us that current scholars have lost

the language with which to express the concepts that these African American women understood.

To the extent these two new books expand our notion of the scope of African American women's political activity, reconceptualize and acknowledge their leadership, and retheorize African American women's place in struggles for citizenship and civil rights, they merit praise and careful attention. Robnett and Barkley Brown deserve an ovation.

The Bully Pulpit: The Politics of Protestant Clergy. By James L. Guth, John C. Green, Corwin E. Smidt, Lyman A. Kellstedt, and Margaret M. Poloma. Lawrence: University Press of Kansas, 1997. 221p. \$35.00 cloth, \$19.95 paper.

Laura R. Olson, *Clemson University*

Like other types of social leaders, clergy serve a role that is not explicitly political. Nonetheless, many do become involved in politics. Clergy are simultaneously citizens, religious professionals, and institutional leaders. As a result, their political attitudes and behavior are shaped by a myriad of forces. *The Bully Pulpit* represents a major step forward in our understanding of why and how clergy become politically involved. It is also a significant empirical contribution to the literature on religion and political behavior.

Not since the 1970s has such serious attention been paid to the political orientations of clergy. Fortunately, the authors have taken this important task very seriously. The wealth of data they have collected on the political attitudes and behavior of Protestant clergy is remarkable; there is also much to be learned from their interpretation and analysis. Over the years these authors have worked diligently to create reliable and valid religious measures, and this effort has served them—and a host of other scholars—well.

The book draws on two decades of research on thousands of Protestant clergy serving eight traditionally white evangelical and mainline denominations (the Assemblies of God, Christian Reformed Church, Disciples of Christ, Evangelical Covenant Church, Presbyterian Church U.S.A., Reformed Church in America, Southern Baptist Convention, and United Methodist Church). The denominations the authors have chosen capture the variety of white Protestantism, but the reader may be left wishing for similar information on African American Protestant clergy, who have traditionally been more politically active than any other group of ministers in the United States. The authors begin by providing rich contextual detail about a handful of specific clergy in a series of anecdotes reminiscent of James Davison Hunter's introduction to his noted book (*Culture Wars*, 1991). These stories, while enormously interesting, are unlike the rest of the book; the chapters that follow are occupied by the presentation and technical discussion of the quantitative data.

The authors base their analysis on the notions of *theology* and *social theology*, which constitute the primary predictors of ministers' political goals and activities. Ministers' basic theological orientations, they argue, are the central components of their overall belief systems and as such may be expected to have a profound effect on their political attitudes. Theological traditionalists (evangelical Protestants) are expected to focus their energies on moral reform, while theological modernists (mainline Protestants) are supposed to espouse a social justice agenda. Social theology refers to "beliefs connecting theology to public affairs" (p. 8). The authors argue that there are two predominating social theologies at work in the United States today: the individualism of conservative evangelical Protestants and the communitarianism of liberal mainline Protestants.

White Protestant clergy therefore come in two distinct breeds, as the authors see it: traditional individualists (conservative evangelical ministers) and modern communitarians (liberal mainline ministers). This "two-party system" dichotomy characterizes the political agendas and activities of white Protestant clergy, as table after table in this book demonstrate. Traditionalist clergy embrace "moral" issues and vote Republican; they prefer to involve themselves politically by stating their views in religious settings. Modernist clergy are more likely to be concerned about social justice and to vote Democrat; they prefer to participate in a wide range of political activities both inside the church and in the surrounding community.

There is, however, diversity within these two "parties"; not all traditionalists are Christian Right activists, and all modernists do not embrace 1960s-style protest politics. In fact, only 9.7% of all clergy these authors surveyed fall into each of these categories. Clergy engage in a wide range of political activities, but some do not participate at all. Moreover, while some clergy prefer to engage in direct political action, others favor a strategy the authors label "cue giving," which involves taking explicit stands on issues or candidates. In short, while ideological orientations appear to fit tightly into a two-party system, political participation may be somewhat less rigidly dichotomous.

This study thus begins to address the important theoretical need to understand the circumstances under which social elites (in this instance clergy) make the choice to translate their leadership into the political realm while others do not. Understanding the circumstances under which clergy become interested and involved in politics paves the way for future research on how clergy create political contexts within their churches. Yet, the authors focus on national patterns, which means that they sacrifice some level of detail in their exploration of intradenominational pluralism. While they argue early on that social context is an intervening variable between theology/social theology and clergy goals and activities, they do not operationalize the notion of context formally. They consider a few contextual measures (such as church size) in their analyses, but their real focus is on the predictive power of the theological constructs. This emphasis on theology and ideology provides an important—but in my view incomplete—account of how and why clergy become politically involved.

Two fascinating challenges are posed by this important and useful book; these flow from the authors' *a priori* assumptions and constrain the study's broad applicability somewhat. First, the utility of the "two-party system" dichotomy would be diminished if the scope of the analysis were moved beyond white Protestants. In particular, neither African American Protestants nor Catholics fit neatly into either of these categories because (in different ways) both groups embrace a complex combination of traditionalism and modernism.

Second, I question whether theology (variously defined and named) is the crucial independent variable for understanding the political orientations of clergy. The exclusion of other important variables tapping such things as local political context may clear the path for the theology variables to succeed no matter what. The way these theological variables are used also suggests that denominational affiliation may be a sufficient proxy predictor of the political orientations of clergy. As I see things, the path between these two variables is far more complex and circuitous than the authors seem to imply. Moreover, there is tremendous diversity within the traditionalist and modernist camps of white Protestantism, which the authors note, but this diversity does not come through as clearly as it could in the book. A simple but telling

observation appears on p. 154, when the authors state directly that "many of these variables are interrelated: theology, social theology, political agendas, and political beliefs." This observation succinctly captures both the major contributions and limitations of this work.

The Bully Pulpit is an important empirical contribution in the best tradition of normal science. It is a valuable compendium of information on the political attitudes and behavior of white Protestant clergy; I, for one, am very glad it exists. Some readers may also find that the book stimulates more questions than it answers, so it is sure to inspire future studies of the political orientations of clergy. These authors have collected an almost overwhelming amount of empirical data. They also have many interesting things to say about the potential mobilizational roles of theology and ideology. The empirical theory they generate about clergy political participation is not yet complete, however. The thriving subfield on religion and politics, in which these authors are pioneers, will undoubtedly continue to work to address this concern.

Enforcing The Law: The Case of the Clean Water Acts. By Susan Hunter and Richard W. Waterman. Armonk, NY: M.E. Sharpe, 1996. 248p. \$66.95 cloth, \$28.95 paper.

James P. Lester, *Colorado State University*

The implementation of environmental policy in the United States over the past two decades is an important topic that has gone largely unexamined. Since we are clearly in an "implementation era" as far as environmental policy is concerned, much more research needs to be directed to the area of subnational implementation of federal environmental policies and programs. This book by Susan Hunter and Richard Waterman addresses that research deficit by examining the enforcement of the Federal Water Pollution Control Act of 1972 (the Clean Water Act) and its various amendments during the 1970s and 1980s. In doing so, they posit two alternative models of regulatory enforcement, the "enforced-compliance" and the "negotiated" model. These are not pitted against each other; rather, the working hypothesis is that "the diverse nature of water pollution problems across the fifty states has created the essential circumstances under which 'pragmatic enforcement' is most likely to occur" (p. 9). The latter approach really means a consensual, more negotiated, approach as opposed to the strict approach.

In examining their hypothesis, the authors argue that the type of bureaucratic response adopted (strict or negotiated) is directly related to the diversity of the regulatory environment. This environment includes the various actors involved, the economic conditions relevant to the problem being regulated, the organizational structure employed by the regulating agencies, the manner in which these agencies interact with one another, the way in which relevant legislation is written, the demographic conditions of the target population for the regulatory action, and the nature of the regulatory problem. Their data are drawn from the EPA's National Pollutant Discharge Elimination System (NPDES) program for 1975-88 and 1989 through mid-1992, together with extensive interviews with EPA personnel, industry representatives, and environmentalists.

Essentially, they find that the diversity of the regulatory environment does indeed matter; specifically, demographic variables (especially state population) are related in such a way that the greater the number of people living in a state (and the greater the racial stratification as well), the greater is the level of NPDES enforcement actions. Moreover, perceptions of water quality, state organizational structures

for protecting the environment, the state income level, and interest group strength (e.g., mining, industrial, and agricultural interests) matter as far as enforcement is concerned. It is surprising, to the authors at least, that traditional political variables, such as LCV scores, registration rates, turnout, and legislative professionalism do not matter with regard to enforcement actions.

Their findings suggest to me that the severity of the water pollution problem is related to enforcement by state implementors. In other words, large populations (especially with a significant amount of poverty) are likely to be associated with pollution severity because people pollute; similarly, the presence of polluting industries will also be associated with pollution severity; and states are responsive to pollution severity will organize to prevent and control pollution. This is what we would expect, and such conclusions leave me with optimism rather than pessimism. If these severity variables are important—and the authors say they are—then politics probably should not matter. Politics would matter if these states' responses were unrelated to severity. In other words, if states are not responsive to the severity of conditions, then politics takes on even more importance; if states are responsive to severity, then politics has not gotten in the way. While my interpretation is admittedly critical of politics, it is a realistic one, for politics itself means dissensus and conflict about how best to proceed on this issue. By responding to the severity of the problem, agency officials are thus acting in a positive manner (and therefore not gridlocked by political divisiveness).

When the authors turn their attention to water pollution outcomes (i.e., improvements in water quality), they find neither population nor racial characteristics to be very strongly related to outcomes, but still they suggest that the finding about racial characteristics and water quality raises rather serious questions about environmental justice. This is a curious interpretation. How can it be that state implementors are, on the one hand, responsive to pollution severity (including states with a large contingent of African Americans) but, on the other hand, not responsive when it comes to the results of their efforts. How can they find some potential evidence of environmental racism in one instance (water quality outcomes) but not in another (water policy outputs)? Could it be that actions taken to remedy a problem do not always produce the intended results in a timely manner, but still agency representatives are behaving in an affirmative and responsible way? The authors pose a paradox for us in that their reversal of findings offers for them two competing explanations, rather than a singular integration of two separate levels of analysis. Can one argue (to the contrary) that state bureaucrats are effective on one level but not on the other, even though their efforts on both levels are well intentioned?

The authors make several policy recommendations, including a shift from "command and control" strategies of enforcement to an "economic incentive" approach. The latter would rely more on the marketplace as opposed to government as the key actor in implementing environmental policy. Their suggestion, while certainly plausible, has been suggested before by neoconservative regulatory reformers, such as Murray Weidenbaum and George Stigler, among others. Yet, it is perhaps the one alternative from among many that has drawn the most criticism and skepticism from environmentalists. How can we reconcile the authors' finding that government actors seem to be doing a good job with their suggestion that we rely more on the marketplace as an approach to implementation?

A final concern is the authors' use of theory and their

epistemology. Why, for example, did Hunter and Waterman not draw more on the literature to guide their analysis of the crucial variables affecting state implementation? There are connections that could have been made between this project and the broader literature on policy implementation. I would like to see how these findings complement (or challenge) other work in this important phase of the policy cycle. Moreover, why did they adopt an essentially inductive approach? Why not combine it with a deductive one? At the end, it would have been useful if they had related their findings to the literature.

Despite some reservations, I consider this is very useful work for policy practitioners and for graduate classes on environmental policy and intergovernmental relations. The book raises many important questions about how best to proceed with subnational implementation of environmental policies. Students will find much in this book that will stimulate classroom debate and further empirical analysis.

New York Politics and Government: Competition and Compassion. By Sarah F. Liebschutz, with Robert W. Bailey, Jeffrey M. Stonecash, Jane Shapiro Zacek, and Joseph F. Zimmerman. Lincoln: University of Nebraska Press, 1998. 234p. \$45.00 cloth, \$20.00 paper.

Robert F. Pecorella, *St. John's University*

The thesis of this book is that politics in New York exhibits a continuing tension between the pressure to keep the state economically competitive and the tendency of state government to be compassionate in dealing with needy citizens. This theme is employed consistently by the principal author, who contributes six of the twelve substantive chapters, but only sporadically by four other authors. The book, loosely divided into a section dealing with political context and one on government institutions, is well suited for use as supplemental reading in a state politics course.

The opening section, which deals with historical, political, and intergovernmental issues, is uneven. On the positive side, an introductory chapter establishes the regional ethnic diversity of the state by tracing the settlement patterns of New York's many waves of immigrants. A subsequent analysis of state-federal relations includes two noteworthy observations. First, since the 1975 New York City fiscal crisis, the state's Congressional delegation, once considered highly fragmented, has proven much more effective in lobbying for state needs in Washington. Second, federal spending in New York is concentrated largely on social programs like Medicaid and not on developmental areas, such as procurement contracts. In other words, federal spending assists policies of compassion but not competitiveness. The chapters on pluralism and the state constitution, in contrast, are frustratingly sketchy. Moreover, it is puzzling why the chapter on the state constitution focuses more on proposed constitutional reforms than on describing the effect of the existing document on state governance.

The section on political institutions includes descriptive essays and insightful political analyses. Addressing the issue of continued party dominance in the face of decreasing party attachments among voters, Jeff Stonecash analyzes the support bases of the two major parties. He points to Democratic control of urban areas, particularly New York City, and Republican dominance in the suburbs and rural areas of the state as the regional manifestation of the diverse interests represented by the two major parties. The regional nature of party power is a bridge to Stonecash's second chapter, which analyzes the legislature. After detailing the evolution of legislative professionalism in New York, he argues com-

pellingly that the highly partisan, strong leadership system in the state legislature reflects and reinforces regional political conflict in the state. Stonecash concludes that the combination of institutional professionalism and a strong leadership system has made the state legislature a potent policymaking force in its interactions with the executive branch.

The executive branch is the focus of two chapters, one on the office of governor, the other on executive agencies. In the former, Sarah Liebschutz makes the point that New York's strong executive is a function of both the impressive range of formal powers held by the governor and the political skills of the individuals who have served in that office. By including an outdated quotation, however, about the governor's powers in relation to a "part-time legislature," she undermines Stonecash's contemporary assessment of legislative equality with the executive branch. She also misses an opportunity early in the chapter to point out that politics in Albany involves interaction between two of the most powerful and professional branches of state government in the country. The subsequent chapter on executive agencies is a largely descriptive overview of the state's bureaucracy.

The remaining institutional chapters focus on the judiciary, local governments, and New York City. In reviewing the judiciary, Liebschutz does a good job of describing a system which appears structured to resist description and of analyzing different methods of judicial selection. Joseph Zimmerman's review of local government authority, framed by Dillon's rule (the "ultra vires" conception), on the one hand, and home rule ("imperium in imperio"), on the other, makes it clear that efforts toward local autonomy have been tempered by court rulings supporting state supremacy. Robert Bailey's insightful contrast of "organizational capacity" and "political legitimacy" highlights the widening economic mismatch between job opportunities and the skills of local residents in New York City as well as the increasingly stark racial divisions characterizing mayoral politics in the city.

This book makes a notable contribution to the state politics literature despite a thematic flow. The decision to employ the term "compassion" to analyze New York's generous social programs was ill advised. Although compassion undoubtedly motivated many social reformers, the size of New York's welfare state is largely a function of New York City's political influence. In the early 1900s, the Tammany political machine used its control of state government to counter Populist challenges to its power base in the city by promoting workmen's compensation, child labor, and a series of progressive factory laws in Albany. During the 1930s, the new class of urban reformers expanded the reach of social programs in an effort to cope with the social instability brought on by the Depression.

In more recent years, the size and scope of the welfare state have grown as gubernatorial candidates of both major parties sought the support of New York City voters and public-sector employees. Successful Democratic candidates have needed a two-thirds vote in the city to overcome Republican margins upstate and in the suburbs. Conversely, successful Republican candidates for governor, with the notable exception of George Pataki in 1994, have needed to hold down the extent of their losses in New York City. Thomas Dewey and Nelson Rockefeller, for example, averaged more than 40% of the New York City vote in their combined seven victories. As a result, the city's social needs have been included on the executive agenda in Albany regardless of the party in power.

Executive focus has now been coupled with that of a powerful legislature, which, as Stonecash points out, reflects regional interests. Since 1975, the Democratic assembly has emphasized policies favorable to urban service recipients and

providers while the Republican senate has stressed the interests of suburbanites and rural residents. Policy compromises designed to satisfy these diverse constituencies have often meant larger government, less fiscally responsible government, or both. The size of government in New York, therefore, is explainable as a function of electoral strategies and political calculations built around New York City. Whatever its other merits, compassion is less than useful as an analytical tool for understanding New York politics.

Left Out: Pragmatism, Exceptionalism, and the Poverty of American Marxism, 1890–1922. By Brian Lloyd. Baltimore, MD: Johns Hopkins University Press, 1997. 461p. \$45.00.

Clyde W. Barrow, *University of Massachusetts at Dartmouth*

Brian Lloyd's *Left Out* presents a direct challenge to the generally accepted histories of U.S. socialism, which attribute the failure of the American Socialist Party to its doctrinaire Marxism (Daniel Bell, *Marxian Socialism in the United States*, 1967) and to the divisive factional politics that resulted from esoteric debates over Marxian theory (David A. Shannon, *Socialist Party of America*, 1967). In contrast to this widely accepted image, Lloyd argues that the history of American Marxism has always been intertwined with American pragmatism, and "indeed, the notion that pragmatism and Marxism share a significant expanse of philosophical and political ground supplies a trademark motif to the history of American radical tradition" (p. 5).

This should be an eye-opening work for contemporary socialists who view a Marxist/pragmatist synthesis as the philosophical basis for renewing democratic socialism, since most adherents of a pragmatic socialism are completely unaware of their historical continuity with this tradition. It is important, for Lloyd, that previous attempts to fuse Marxism and pragmatism resulted in "avowed Marxists . . . fighting with non-Marxist—and explicitly anti-Marxist—thinkers for possession of the same scientific preconceptions" (p. 6). In other words, because philosophical pragmatism proved far more compatible with new liberal politics than with socialist politics, pragmatism became the wedge that enabled liberals to "take Marx away from the Marxists." The historical lesson for Lloyd is that socialists need to discern and uphold "Marxist theoretical orthodoxy" (p. 414), and "this project requires, as a first step, moving the discussion off the ground upon which Madison, Beard, and Marx look like philosophical kin" (p. 11).

Since Lloyd considers the poverty of American Marxism an "ideological condition," he reconstructs the development of American socialist theory from 1890 to 1922 through an approach "that is both rigorously textual and steadily contextual," although the bulk of Lloyd's "analytic work consists in close textual readings" of socialist theorists (p. 14). The analytic goal is to document a successively widening gap during this critical period between American socialist theory and the so-called "Marxism of Marx" (p. 7). Lloyd's reading of American socialist theory resounds with echoes of Louis Althusser and Etienne Balibar (*Reading Capital*, 1970) and Goran Therborn (*Science, Class, and Society*, 1976). In fact, Lloyd's analysis applies the structuralist critique of "historicism" and "empiricism" to the development of American socialist theory. Hence, in reconstructing the thinking of key socialist theorists, Lloyd juxtaposes each of them to the Marxism of Marx, which he equates with the categories that "define Marxism as a distinctive brand of socialism": mode of production, productive forces, social formation, and social

relations of production (pp. 157, 99). Thus, despite the political factionalism of the American Socialist Party, Lloyd argues that these disputes were minor skirmishes within "a single problematic," that is, the evolutionary/pragmatic socialism of the Second International (p. 57).

Lloyd traces the development of American socialist thought through three periods of development. From 1901 to 1905, leading Socialist Party theorists embraced a Spencerian Darwinism that located (and subordinated) Marx within a more encompassing positivist and evolutionary historical framework. Thus, American socialism began with Marx in a subordinate position, and this "error" established the basis for a second period (1905–12), when American socialists began to substitute Thorstein Veblen for Marx (whose writings, we should recall, were not available in English translation until 1905). Given "Veblen's ideological kinship with pragmatism" (p. 58), the substitution of institutional economics for Marxian economics provided the necessary bridge to pragmatism after 1912. In this critical transition, socialists shifted away from Marx altogether to William James and John Dewey. This shift resulted in a Marxism "shorn of the abstract, non-empirical concepts of *Capital*" (p. 83) and thus deprived American socialists of "the distinctive and abstract character of Marxist political economy" (p. 123). Lloyd's final assessment is that this "ideological poorhouse" left American socialists unprepared to assimilate anything but a "practical Lenin" after the Russian Revolution (p. 408), rather than the "nonpositivist, non-Darwinian Marx that Lenin read" (p. 410); that is, the Lenin who emphasized that "without revolutionary theory there can be no revolutionary practice."

Historians and political theorists, including myself, will pose numerous challenges to Lloyd's analysis and conclusions, but as one might expect of an Althusserian, this book is the most intense and systematic analysis of American socialist theory produced to date. Lloyd not only provides a very detailed and meticulous reading of key socialist theorists, such as James T. Kloppenberg (*Uncertain Victory*, 1986), but also situates his analysis comparatively by drawing explicit links with similar debates raging throughout the Second International. Lloyd also makes a political point that is worth considering independent of his methodological framework: The gap between Marxism and socialism, on the one side, and pragmatic liberalism, on the other side, has been submerged and systematically obfuscated throughout most of this century to create an artificial "progressive synthesis" and "liberal consensus." Indeed, whether or not one accepts the details of Lloyd's analysis, it is worth exploring whether the great intellectual mistake of American socialists is their continuing tendency to be fellow travelers of middle-class liberal politics.

Welfare as We Knew It: A Political History of the American Welfare State. By Charles Noble. New York: Oxford University Press, 1997. 210p. \$45.00.

Gretchen Ritter, *University of Texas at Austin*

Why is the American welfare state so different? It is a question which has engaged students of American politics for much of the century, yet on which scholars have yet to agree. It is also a question particularly relevant in the wake of the 1996 welfare reform law, which fundamentally changed a half-century-old commitment to public entitlement for poor women and their children. To understand the current retrenchment, Charles Noble provides a broad historical and institutional review of American social policy in the twentieth century. He argues that the weaknesses and peculiarities of

the American welfare state are rooted in fundamental features of the American political system.

The claim that the American welfare state is exceptional is based on a comparison particularly to the social democratic states of Western Europe. In contrast to these nations, the United States has done little to offer universal entitlements for income, housing, or health care to its citizens. Except for the social provisioning offered to the elderly, most American social programs are underfunded and narrowly targeted to politically weak groups. The vulnerability of such programs was clearly demonstrated in the latest round of welfare cuts, which may be responsible for the current upsurge in hunger and homelessness in many American cities.

Scholarship on American welfare state exceptionalism may be broadly divided into three approaches. Many comparativists emphasize the relative balance of power between labor and business as crucial to the establishment of social provisioning. According to this view, in the United States, where labor is politically weak and business is politically strong, effective political support for welfare never developed. In contrast, other scholars have focused on the particularities of the nation's political institutions, both within and outside the government (especially the nature of the party system). Catch-all parties, federalism, and judicial review are some of the systemic features which have purportedly thwarted efforts at increased government activism. Finally, scholars of political culture point to the role of American liberalism in shaping popular attitudes toward public entitlement. Accordingly, the popular preference for small government and disfavor toward the dependent poor have limited the appeal of social provisioning for all but the most deserving, such as veterans and the elderly.

In *Welfare as We Knew It*, Noble combines aspects of the first and second approaches while rejecting the relevance of political culture as an explanation. For instance, he uses opinion poll results to show substantial public support for the view that "the state should guarantee every citizen food and basic shelter" (p. 12). Instead of political culture, then, Noble argues for an analysis that shows "how societal interests and political institutions *combine* to shape the environment in which reformers act" (p. 16). Noble emphasizes not only the role of weak labor and strong business interests, but also the ongoing relevance of racial division to undermining support for social provisioning. In the area of political institutions, he argues that decentralization has been the most important limiting factor in social policy development. These fundamental features of the American political context have made the task of building a strong welfare state a daunting one even for the most ambitious and effective political reformers. Even so, Noble reviews historical moments of welfare state development to argue that there were missed opportunities that might have been taken.

Having established the problem and his theoretical framework, Noble devotes the central chapters of his book to an analysis of historical instances of welfare state development. Three of these chapters examine periods of welfare state expansion in the 1910s, 1930s, and 1960s. In his chapter on the New Deal, Noble is critical of FDR for failing to go farther in establishing a universal commitment to full employment. Politically, Roosevelt is faulted for trying to gain the support of hostile business groups and for being too reluctant to challenge the conservative southern wing of his party. The latter portion of the book focuses on the retrenchment of the welfare state since the 1970s. According to Noble, the genius of the Reagan administration's efforts to limit social provisioning were centered not in conservative ideology but in the fiscal restraints provided by a ballooning

budget deficit and new pay-as-you-go spending rules. During the 1990s, Newt Gingrich and his allies are credited with providing the ideological vision (with its emphasis on voluntarism, cultures of poverty, and individual behavior) that undercut public support for welfare. The Clinton administration's capitulation to this vision in 1996 is portrayed as political realism under extremely unfavorable circumstances. In his final discussion of future welfare state possibilities, Noble stresses the need for fundamental institutional reform in the electoral system and labor law.

The strength of this book lies in its often astute political analysis of the circumstances under which social policy proposals succeeded and failed. Furthermore, Noble's particular attention to the role played by racial politics and competitive federalism in limiting welfare expansion seems especially insightful. More generally, this book provides a useful synthesis of the work of many other scholars who have studied the American welfare state in historical perspective.

Yet, some aspects of the book are less convincing. In some ways its understanding of which societal interests are relevant seems quite traditional. There is relatively little analysis of the role of gender in welfare state development, which is particularly striking given the wealth of recent scholarship on this subject. As Theda Skocpol and others have shown, the origins of American social provisioning lie largely in the efforts of middle-class women reformers in the early part of the century to establish programs to benefit women and children. While Noble acknowledges the role of women's groups in his chapter on the Progressive Era, he devotes most of the chapter to discussing why labor was absent and business was hostile to national social policy. Furthermore, he is fairly explicit in arguing that a maternalist welfare state (centered around women as mothers) is inherently weaker than a paternalist welfare state (centered around men as workers) would have been. In other scholarship on the maternalist origins of American welfare, there is a great deal of contention over whether the original maternalist programs were positive or negative (most acknowledge that in the long run AFDC was negative), but few would go so far as to argue that paternalist policies are inherently superior.

When Noble brings his discussion up to the present he also fails to discuss the role of gender in the politics of welfare reform. This is striking, since the main program under assault by conservatives in 1996 was AFDC. Much of the congressional and popular debate on welfare reform revolved around the supposed sexual and maternal behavior of the women who receive public support. It seems that Noble misses much of this because of his assumption that class interests are the ones that matter most (except perhaps for race) and his tendency to downplay the role of political culture in welfare development.

Noble denies the relevance of political culture and ideology for two reasons. Empirically, he argues that polls show greater support for welfare than would otherwise be expected. Theoretically, he contends that culture and ideology tend to be endogenous variables without independent causal influence. His first point is important; certainly, political outcomes should not be taken as simple reflections of public preferences. Yet, it is not clear that we should be satisfied with an analysis of political culture which relies on the selective use of polling data. Theoretically, most interpretivists would agree that culture cannot be treated as an isolated, exogenous variable. To think otherwise is to misunderstand the nature of culture, which is embedded in lived experience. But to deny culture's relevance to political understandings and outcomes is another matter. The problem is one of scholarly analysis rather than one of causal influences.

Welfare As We Knew It makes a useful contribution to the ongoing debate over American welfare state exceptionalism. Noble's grasp of the scholarship in this area is substantial, and his use of a historical institutional analysis is quite insightful. Finally, his bottom-line argument, that the constraints on welfare state development derive from fundamental features of the American political system, is convincing.

Women, Media, and Politics. Edited by Pippa Norris. New York: Oxford University Press, 1997. 269p. \$19.95 paper.

Laurie A. Rhodebeck, *Oberlin College*

Pippa Norris describes the objective of her edited volume as an attempt to "see whether the media frame gender politics 'with a different eye,' which hinders women's participation in public life" (p. 11). Media framing provides the organizing concept for this collection of thirteen original essays. Norris uses the concept in the tradition established by Erving Goffman (*Frame Analysis: An Essay on the Organization of Experience*, 1974), popularized by Todd Gitlin (*The Whole World Is Watching: Mass Media in the Making and Unmaking of the New Left*, 1980), and now widely applied by scholars in sociology, political science, and communication studies.

Framing provides a way to think about how information is presented to the public. News frames are persistent patterns of selection, interpretation, and presentation that lend order and meaning to complex issues, processes, and events. They have been described as "pegs" that organize the world for both journalists and their audience. Communications scholars emphasize the value of news frames for journalists: They enable journalists to process and package information quickly and routinely. Because the organizational imperatives of the news business make framing an inevitable feature of reporting on politics, evaluations of media performance should consider several questions about news frames. What is the frame for a particular story? Which alternative frames might have been employed? How does the frame for one story reinforce or undermine frames for other stories? What factors explain the choice of a specific frame? What are the consequences of using one frame rather than another?

Norris argues that the heightened salience of gender in American politics, manifested by such phenomena as the gender gap in voting and the increasing number of women running for public office, provides the basis for explicitly gendered news frames. Gender has become a common peg for news stories about certain voters, candidates, leaders, and issues, prompting Norris to question whether a gendered frame advances or retards women's participation in public life. Since news frames tend to reflect the dominant cultural perspective, groups challenging this perspective often criticize the manner in which the mainstream news media portray their interests and actions. Criticisms of gendered framing focus on the stereotypical presentations of women, the neglect of issues important to women, and the lukewarm evaluations of women's achievements.

To assess these concerns, Norris has assembled thirteen essays whose authors include journalists and a variety of established and emerging scholars in political science and communications. The two chapters in the first section of the book examine the role of men and women as journalists. Four chapters in the second section analyze recent campaign coverage of gender politics. Three chapters in the third section explore changing images of women in power. Finally,

four chapters in the fourth section address topics that range from the framing of the women's movement and feminism, to the gendered characteristics of talk radio, to efforts at improving media coverage of women. I would describe each of the thirteen chapters as an attempt to answer one of the following questions: What are the gendered frames used in reporting on women? What factors help account for such frames? What are the effects of these frames?

Several characterizations of gendered news frames emerge from the various analyses. Stories about politics tend to be presented in masculine terms. Accounts of the political gender gap, feminism, and the women's movement oversimplify the nature and significance of these phenomena. Coverage of women leaders, whether heads of state around the world or congressional representatives in the United States, accentuates their roles as pioneering outsiders who are agents of political change. News about these women often focuses on their contributions to policies associated with women's issues, rather than their work in other policy domains. The good news is that these women receive about the same amount of coverage as men in comparable positions, and the coverage is generally free from sex stereotypes.

Explanations for the development of gendered news frames often start with journalists. This book offers evidence that the increasing number of women in journalism has resulted in expanded coverage of women's issues and greater reliance on women as quotable sources. Women journalists are also more likely than their male colleagues to cover women politicians. Revised professional guidelines have helped eliminate blatant sexism from the news, but they have not ensured attention to women on a par with that accorded men. Journalists are not, however, solely responsible for the creation of gendered news frames; women who are the subjects of news stories also contribute to the framing process. Two findings from the book support this point. One is that women campaigning for Congress are more likely to emphasize women's issues as their unique domain of competence. The other is that leaders of the women's movement are sometimes to blame for providing simplistic or conflicting frames about their movement. None of the essays examines how broad cultural forces shape news frames.

As for the effects of gendered news frames, the evidence in this volume is confined to the reactions of potential voters. The findings indicate that women candidates are more likely to be successful when their campaign emphasizes issues stereotypically associated with gender. Contributors to the book also speculate that news framing of feminism may affect the public's understanding of and support for the women's movement as well as the repertoire of strategies available to the movement.

On the whole, my reactions to this book are favorable. The essays range widely over a variety of topics likely to interest scholars who study either politics and the media or politics and gender. Initially presented as draft papers at a conference held at the Joan Shorenstein Center on the Press, Politics and Public Policy in August 1995, the chapters have clearly benefited from interactions among the conference participants. All explicitly cross-reference other chapters in the book when relevant points arise. The majority employ rigorous, even imaginative, research designs representing a variety of methods—personal interviews with reporters and editors, focus groups, experiments, surveys of voters and campaign managers, quantitative and qualitative analyses of news coverage.

I do have some reservations. One concerns the use of the framing concept. As sometimes happens when ideas gain

broad popularity in different disciplines, conceptual clarity suffers. We think we know what one another means, but perhaps not. How do news frames differ from other message forms, not only in their structure and content but also in their effects? When is a news frame gendered? When is it not? An extended theoretical discussion about framing as a process of symbolic communication would have enhanced the value of the concept as the book's principal unifying device. My other reservation concerns assessments of the effects of gendered news frames. Several essays raise objections to the ways in which news stories about women and their interests are framed. A recurring example is the complaint that coverage of women politicians overemphasizes their work in policy domains associated with women's issues. Maybe so, but publicizing their expertise in such domains has helped women candidates gain credibility and support among voters. This is the book's only empirically demonstrated effect of gendered news frames. Although a few other possible effects are mentioned, no others are empirically examined. This is an essential step toward identifying what Norris asserts are the "significant consequences" (p. 7) of gendered framing. Without such evidence, we are far from understanding the circumstances under which gendered news frames advance or retard women's participation in public life. Perhaps this volume will stimulate further research on these potential effects.

Race, Politics, and Governance in the United States. Edited by Huey L. Perry. Gainesville: University Press of Florida, 1997. 240p. \$49.95 cloth, \$21.95 paper.

Georgia A. Persons, *Georgia Institute of Technology*

Huey Perry has produced an interesting anthology on black politics that is focused around the concept of deracialization. His major contention in this volume is that something critical and illuminating needs to be said about the concept of deracialization and its treatment in the scholarly literature up to the publication of this anthology. That argument is strongly implied but is never clearly made, perhaps due to the fact that the editor never directly acknowledges the major scholarly contributions on this topic, such as the works of Charles Jones, Joseph P. McCormick, Zaphon Wilson, and Alex Willingham (see Georgia A. Persons, ed., *Dilemmas of Black Politics: Issues of Leadership and Strategy*, 1993). The omission of a full discussion of the earlier scholarly work in this area undermines the clarity of the analyses in this volume, as Perry does not effectively establish an analytical or conceptual point of departure. That he refuses to make direct acknowledgment of the aforementioned scholars and their works, of which he clearly attempts to make "a straw man," is all the more interesting when one considers the fact that Perry has known each of these contributors as close colleagues for at least two decades.

The title of this volume whets the reader's curiosity but promises much more than it delivers. Much of the failure of the book is due to the rather limited analytical framework set forth in the introduction. One example is what serves as the analytical crux of the editor's framework, that of a distinction between "traditional" black politics and deracialized politics. Such a gross dichotomy obscures the many nuances and major variants of black electoral politics and the perplexing questions and grand contradictions raised by them. In short, one cannot point to a time when the dominant pattern of black politics can be characterized as traditional with any useful distinctiveness. Thus, to draw a dichotomy between traditional black politics and deracialized politics is much too loose an analytical divide to be useful.

The contributions in this anthology by Roger Oden on the election of U.S. Senator Carol Moseley-Braun and by Mylon Winn and Errol Palmer on Norman Rice's election as mayor of Seattle are very useful in that they address the central question raised by earlier work on deracialization. How can a black candidate effectively mobilize a white majority so as to secure victory in an electoral contest in which the historical primary support base for black candidates, that is, black voters, is a significant minority in the population? Such efforts by black candidates on a relatively large scale are intriguing and analytically significant, and they were thus analyzed in earlier works on deracialization although they were not unprecedented occurrences. The most interesting phenomenon that earlier work on deracialization attempted to incorporate was the reach of some black candidates in pursuing offices traditionally not much sought by blacks, such as statewide election at the gubernatorial level and U.S. Senate contests.

The second and more analytically important distinction drawn in earlier work on deracialization involved what had been a dominant but not exclusive pattern of racial insurgency, which had pervaded black politics during a time when a majority of black candidates were seeking to become the first black elected in a given locale and to a given political office. Insurgency quickly faded to a more accommodationist style and even to concerted racial reconciliation attributable to a changed political context, the realities of governing, and increased black-on-black competition that altered the currency of race in unpredictable ways.

The contributions in this anthology cover some electoral contests previously analyzed within the context of deracialization. The volume also contains, however, an assortment of analyses of electoral dynamics surrounding efforts by black contestants to win elective office in a variety of racially defined settings. The reader will not find enough effort devoted to developing and setting forth a framework for analyzing deracialized governance as distinctive from whatever its counterpart might be. Despite the interest whetted by such an idea, there are ample reasons to doubt that development of such a distinctive and informative framework as deracialized governance would be an easy task.

One contribution particularly stands out, the chapter by Lenneal Henderson on Kurt Schmoke's tenure as mayor of Baltimore. The piece sets up a context for addressing the core issues of politics and governance in black-governed cities; that is, a highly complex set of intertwined problems ranging from crime, to the flight of the white and black middle class, to the at once energizing and destabilizing forces of globalization, all of which pivot around issues of political economy. Although readers will long for more development of this analytical path than Henderson provides, they will greatly appreciate his central contribution to the volume and to critical thinking about urban politics generally: White racism persists as a factor in urban politics, race is essentially a shibboleth in explaining much that is of critical importance in the governance of urban America. The challenge for scholars of black politics is to understand this contradictory dynamic and capture it in conceptual terms. We might use the notion of deracialization in this effort but in a wholly new manner if we wish to make significant contributions to either the theory or practice of black politics or to an understanding of the relentless press of broadly based socioeconomic change that forms the crucible of all politics.

God at the Grass Roots: The Christian Right in the 1996 Election. Edited by Mark J. Rozell and Clyde Wilcox. Lanham, MD: Rowman & Littlefield, 1997. 292p. \$60.00 cloth, \$22.95 paper.

The Christian Coalition: Dreams of Restoration, Demands for Recognition. By Justin Watson. New York: St. Martin's, 1997. 295p. \$35.00.

Stuart A. Lilie, *University of Central Florida*

In quite different ways these books increase our understanding of the dynamics of the Christian Right. The Watson book studies the Christian Coalition, focusing on the thought of Robert Reed and Pat Robertson, while the Rozell and Wilcox book analyzes at the state level the role played by the Christian Right in the 1996 elections. Although the Watson book is the outgrowth of a department of religion dissertation, it is a mature, careful analysis free of the usual shortcomings of dissertation-based books. Watson studies the publications and speeches of the Christian Coalition but does not use formal interviews or mass surveys. Early chapters deal with the history of the Christian Right, concluding that the Christian Coalition has institutionalized the evangelical revolution. This institutional treatment will be familiar to students of the Christian Right, but the general reader will find these chapters useful background. All readers will find much originality and value in the systematic analysis of the often-contrasting views of Reed and Robertson.

Watson's background in theology and religious history is reflected in the mastery with which he organizes and critiques the admixture of theology, sociology, politics, and history that characterizes the Christian Right.

The overarching question Watson asks is whether the Christian Coalition, and by extension the Christian Right more generally, seeks recognition or restoration—goals which he finds ultimately incompatible. To seek recognition, “a place at the table,” in a pluralist society is ultimately incompatible with a desire to return Christianity to the centrality and primacy it presumably once enjoyed. Recognition is a confirmation of pluralism; restoration is a rejection of pluralism. Watson concludes that both these goals are taken seriously by the Christian Coalition leaders, even though such a position is “confused and contradictory” (p. 179), a contradiction that goes largely unrecognized by Christian Right leaders. In reaching this conclusion Watson rejects two other answers. He dismisses the Trojan horse argument that the Christian Right's plea for recognition is simply a deliberate ploy to gain sympathy and support, with the actual goal remaining restoration. He also rejects the view that a now more politically mature Christian Right recognizes the strategic limitations of attempts to restore a Christian nation, and thus the goal truly has become one of recognition.

While Watson's conclusion has merit if not drama, the major strength of the book is the finely detailed analysis of these two goals in the two chapters analyzing the coalition's “dreams” off restoration and recognition. An illustrative example of the wealth to be found in these chapters is Watson's analysis of the parallels between the multicultural movement, roundly criticized by the coalition, and the coalition's desire to seek proper recognition of its own culture. Both movements express a sense of victimization, recall a usable past, and critique the source of their oppression. Here as elsewhere, Reed and Robertson agree upon the general outline of the problem but differ greatly in their analysis of its nature and source. Robertson, who often manifests Hofstadter's “paranoid style” of politics, sees Christian victimization as part of a larger centralized, even Satanic, conspiracy

traceable to the Enlightenment. For Reed, religion has been marginalized because of the social and institutional dynamics of modernity, because of evangelicals' withdrawal from politics, and because of the Left's failure to appreciate its own reliance on religious values as a means of legitimizing change. Reed is correctly understood in the press as advocating a more pragmatic, inclusive approach for the Christian Right. Some of the intellectual differences Watson demonstrates between Reed and other leaders may help us understand Reed's pragmatism as not simply strategic but as also reflecting a less rigid, less conspiratorial view of the problems facing people of faith.

The volume edited by Rozell and Wilcox provides a wealth of background and data at the state and local level in fourteen states. This focus is particularly appropriate given the Christian Coalition's goal of building strength at the subnational level. The chapters reveal tremendous state-to-state variation in the effectiveness of evangelical mobilization. The success of the Christian Right ranges from the consolidation of strength in South and North Carolina, Georgia, and Texas to two states where the movement, for different reasons, is not in contention, West Virginia and Maine. The other states studied, Virginia, Florida, Michigan, California, Washington, Oregon, Minnesota, and Kansas, fall somewhere in between in roughly that order. These chapters are mostly authored by acknowledged scholars in a field where theories and analytic categories have been greatly refined in recent years. They reflect normal science in a way that would have been impossible in the study of religion and politics only decades ago. Each chapter generally includes an historical description of the state's political culture, the specifics of candidates and issues in the 1996 election, the outcomes of the election, and speculation as to the future possibilities for the Christian Right in that state. Published shortly after the election, most of the analysis of individual voting behavior relies on exit polls and aggregate data. Thus, some of the voting behavior analysis may be superseded by fuller surveys. Nevertheless, the institutional and political analysis will remain of value, especially given the tendency of general electoral treatments to neglect and misread the significance of the Christian Right.

Overall, 1996 was a mixed year for the Christian Right. There were significant losses but also signs of consolidation. The chapters in this book make clear that the success of the Christian Right, even in states where the movement is relatively strong, has several limitations. On a statewide basis, as compared to more localized opportunities, candidates closely identified with the Christian Right have great difficulty in being elected, as evidenced by Ellen Carswell's decisive defeat for governor in Washington and by the 1994 defeat of Oliver North for the U.S. Senate in Virginia. When candidates share many of the values of the Christian Right but are not explicitly tied to the movement, their chances are much better, as evidenced by John Warner's reelection to the U.S. Senate in Virginia. Another limitation, found even in states such as Texas, where the Christian Right is largely in control of the GOP organization, is that initial successes often tend to activate and energize groups opposed to the Christian Right agenda. The dynamics of the Christian Right with the Republican Party is still another limitation. In addition to the concerns Republican leaders have about the electability of candidates closely identified with the Christian Right, Republican moderates disagree with the Christian Right on many issues and often see evangelical activists as uncompromising political parvenus. GOP moderates often contribute to the electability problem by labeling as radical the Christian Right candidates in primary battles and some-

times even supporting Democratic candidates in general elections. Thus, while the Christian Right generally needs the Republican Party, ironically it is sometimes more successful in local areas where the party organization is relatively weak. Where the GOP is strong, the inherent limitations of the Christian Right within the party structure are likely to be more acute.

If the movement is to overcome these limitations, Christian Right leaders are faced with a major dilemma. On the one hand, they may broaden the range of issues they support and deemphasize their more strident positions to become more attractive to the Republican Party and the general electorate. This approach is advocated by Ralph Reed and runs the risk of losing core supporters for whom the commitment to these issues is their central motivation. On the other hand, to remain true to these core issues in order to preserve membership risks the continued alienation of Republican leaders and the general electorate. In upcoming elections this debate between the pragmatists and purists will continue. The tensions between evangelical and Republican leaders will also continue, particularly given the more recent debate surrounding the effect of independent political ads on the election of conservative candidates. As these issues and debates unfold, this book provides a wealth of information and analysis to help us understand the commonalities and the subtle variations among the states in the fortunes of the Christian Right.

Race, Law and Culture: Reflections on *Brown v. Board of Education*. Edited by Austin Sarat. New York: Oxford University Press, 1997. 238p. \$45.00 cloth, \$16.95 paper.

Elliot E. Slotnick, *The Ohio State University*

Race, Law and Culture is a collection of diverse essays commemorating the 40th anniversary of *Brown v. Board of Education*, drawn from a conference held at Amherst College. Among the contributors are several law professors (Peggy Cooper Davis, Lawrence Friedman, Paul Gewirtz, Gary Peller, and David Wilkins), political scientists (George Kateb and Austin Sarat), an African-Americanist (Hazel Carby), an anthropologist (Carol Greenhouse), and a freelance journalist (David Garrow). These essays "answer" few questions but suggest the range of views about *Brown* and its legacy, underscoring, as noted by Sarat, that *Brown* "unsettled as much as it resolved" (p. 7).

The volume is organized in distinct, albeit closely related, sections loosely mirroring the components of the book's title. Part I, "Brown and Its Legal Contexts," focuses most directly on the decision itself. Part II, "Racial Discrimination and Antidiscrimination," ponders the adequacy of *Brown*'s vision of the antidiscrimination principle as articulated in Earl Warren's opinion. Part III, "Reading the Realities of Race," explores the broad social consequences of *Brown* on American lives, both black and white. While some analysts have raised serious questions about the extent to which *Brown*, per se, played a pivotal role in fostering change in American society (see Rosenberg's *The Hollow Hope*, 1991), none of the essayists represented here takes such a minimalist posture. Still, substantial disagreement can be found among these authors about what, precisely, the decision accomplished. These essays will be justifiably attractive to a wide audience of academicians, legal professionals, students, and laypersons. I will focus, however, on those pieces that will hold particular appeal to political scientists.

Davis's essay, "Performing Interpretation," opens the book by suggesting how the argumentation dance of the opposing

lawyers, Thurgood Marshall and Robert Carter for the plaintiffs and John Davis representing South Carolina, served to structure the way in which the case was viewed by the justices. The language of the plaintiff attorneys successfully subverted the image of the United States as a white polity while countering Davis's portrayal of a "closed" constitutional text. Marshall and Carter "seized authority to participate in the shaping of doctrine.... And the Justices followed" (p. 44). For those who "know" the *Brown* opinion, Davis's road map successfully traces the antecedents. One wonders, however, why she did not go farther to demonstrate the plaintiff's success directly through Warren's own choice of words and interpretive approach. Viewed broadly, Davis's essay also highlights the important role of litigators in framing adjudication and the potential importance of oral argumentation in judicial decision making.

Friedman's contribution, "Brown in Context," moves back in time to the "timid hand wringing" that met the decision. We are reminded that in such watershed cases it is all too easy to overstate the importance of the text itself. Thus, "anybody who feels that a more tightly crafted and better reasoned opinion... would have had a bigger (or even different) impact on life in rural Mississippi (or even Washington, D.C., for that matter) than what Warren actually wrote, can't be living on this planet" (p. 51). Friedman's persuasive critique of "the world of the legal mandarins" will, undoubtedly, provoke a good deal of contumely: "It is a deadly sin of law professors to imagine that their little internal quarrels have a vital effect on the actual impact of cases" (p. 65). Friedman also explores the manner in which *Brown* cast aside the formalistic "person from Pluto" approach to legal reasoning dominant in previous litigation. Ultimately, it is difficult to find fault with Friedman's conclusion that what drove *Brown* "was the strong sense that segregation was just plain wrong" (p. 61).

Flowing nicely from the Friedman piece is Garrow's essay, "From Brown to Casey," which argues that *Brown* stands for the repudiation of historical intent as an interpretive device. Marking the advent of the "modern" Court, *Brown* fanned policy activism by relying on a "dramatically expansive and aggressively anti-historical reading and application of the Fourteenth Amendment's Equal Protection and Due Process Clauses" (p. 75). The result has been a "better America precisely because of how the Court has ignored the Constitution's historical limitations" (p. 75). Garrow concludes that "substantive due process is—as it should be—a fundamental and fully accepted aspect of present-day American constitutional doctrine" (p. 83).

The thrust of Garrow's essay, like its predecessors, goes well beyond *Brown*. Problematically, however, these chapters (as well as others) seem to take it as a given that interpretive judicial backsliding on the Court both will not and cannot occur. At bottom, these readings tend to minimize or ignore a substantial array of legal scholarship, popular writing, and court decisions in recent years that have circumscribed federal power. The sense of irreversibility about the thrust and nature of judicial power (and not, of course, about the holding of *Brown*) that permeates these essays simply does not ring true. Many chapters (add Gewirtz's "The Triumph and Transformation of Antidiscrimination Law," discussed below, to this brew) are written almost as if the 1980s never occurred and are both not alive in some quarters today and may not possibly flourish in the future.

Gewirtz's essay, perhaps more than any other, underscores both the broader implications of *Brown* beyond race (in locales such as discrimination premised on gender, age, disability, and religion) as well as the substantial changes that

have occurred in the antidiscrimination principle. Thus, while the antidiscrimination model has "triumphed" in the sense that the domain of its applicability has dramatically widened, the fundamental meaning of nondiscrimination has been altered. Whereas, traditionally, nondiscrimination meant treating people the same, it has come to underscore the necessity of treating them differently in order to accommodate differences. Ironically, the one area in which such a transformation has, arguably, not taken place as strongly as Gewirtz suggests is the area of race-based affirmative action. Indeed, one (perhaps unintended) consequence of Gewirtz's analysis is to demonstrate how far out of synch contemporary societal controversy on affirmative action is when contrasted with other areas in American life that have been more receptive to accommodationist policies.

Gewirtz's thoughtful contribution balances the benefits and the liabilities of the trends he examines in an unabashedly self-searching analysis. Particularly troublesome for the author is the transformation of the societal rationale for affirmative action from the necessity of correcting past discrimination to the seemingly less justifiable goal of seeking diversity for its own sake. While one may disagree with Gewirtz about whether changes in the equality principle have been salutary, it is most important to point out (as the author does not) that such changes have not been, necessarily, reflective of philosophical societal shifts in defining equality or, necessarily, the consequence of preferred choices by civil rights advocates. Rather, they reflect, at least in part, tactical choices made in the wake of *Bakke* and other decisions, where the diversity rationale, for all intents and purposes, was the only approach to pursuing affirmative action that received judicial sanction. Clearly, the movement to the diversity rationale may have been driven by the Court at least as much as it has been by the civil rights movement.

The remaining contributions to the volume are worthy of the reader's attention, although they are somewhat less focused on *Brown* per se and appear less likely to tap the sensibilities of "mainstream" political scientists. Kateb, for example, argues that Harlan's *Plessy* dissent did a "better" job than Warren's *Brown* opinion in identifying the many recipients of segregation's harm, including the harm done to the majority race as well as to the notion of republican citizenship. While persuasive, it is difficult to approach Kateb's analysis without summoning up Friedman's image of the debates among legal mandarins. Other essays run much farther afield, tapping some of the exogenous effect of the *Brown* ruling.

In the final analysis, the reader leaves *Race, Law, and Culture* in much the same way that one might a very filling and satisfying multicourse meal from an unusually eclectic and well-conceived menu. You have tasted numerous flavors as well as some combinations that you have not experienced before. Not all are equally memorable, yet none have left a bad taste, and all the dishes were well worth trying. I have little doubt but that you will recommend this restaurant to others and will look forward to comparing your dining experiences.

The Betrayal of the Urban Poor. By Helene Slessarev. Philadelphia, PA: Temple University Press, 1997. 204p. \$59.95 cloth, \$18.95 paper.

Michele Hoyman, *University of Missouri-St. Louis*

In *Betrayal of the Urban Poor*, Slessarev asks a central and compelling question in urban politics and political economy: Why have social policies failed to alleviate the problems of

the urban poor? The governmental solutions to the problem of the urban poor were myriad: equal employment opportunity legislation (Title VII of the Civil Rights Act of 1964), job training programs, fair housing acts, and minority set-asides, among others, all of which Slessarev critiques as ineffectual. In the current environment, it is both refreshing and rare that a scholar (or activist) is asking this question, either from a normative or an empirical perspective. In the 1960s this question dominated the social discourse, and there was an urgency to it being answered, since there were several mass mobilizing movements: the civil rights movement, the community organizing movements among the urban poor, and the anger boiling over into urban riots. In my view, the question of how best to end urban poverty remains an important and compelling question in terms of justice and in terms of social science research, and I applaud Slessarev's efforts at keeping the question alive. Slessarev is uniquely situated to address this issue, being a Chicago insider, former activist, and social researcher.

The richest parts of this book are the tales from Chicago about urban political experiments, grassroots organizing efforts, and social reforms, with the fascinating Chicago politics as a backdrop. I found the author's analysis of Mayor Harold Washington's time in power particularly poignant. In fact, I found the Chicago story subtext much more convincing and interesting than the general federal policy subtext.

Slessarev's thesis is that the raft of social programs passed in the 1960s failed to ameliorate the problems of the urban poor. This is not startling news, since many liberals and conservatives alike wrote the obituaries of these programs, some of which are now defunct. Slessarev's conclusion is really also her starting premise. The author does not adduce an overwhelming amount of evidence to support her conclusion, but instead accepts it as a given, although not a controversial one. She spends more time and data on explaining the failure of the programs and developing the reasons for their failure. She blames the very interest groups and advocates who lobbied to get these programs passed—the Democratic Party, organized labor (and particularly the craft unions in the construction industry), and middle-class blacks.

The strong points of this book lie in the analysis of the social history that is conveyed vividly to the reader: the context in which each of these policy solutions was born, how the flaws were evident at the program's inception, and the fact that some of the weaknesses in the policy or program were deliberate. Chapters 1–4 are a good read as regards the social case for the goal of economic equality for the urban poor. As such the book should be required reading for every new student of urban politics. For the many undergraduates who may ask themselves or their instructors why a particular program was needed, Slessarev provides a full and compelling answer.

The book is ambitious in the range of policies it examines: equal employment opportunity legislation (such as Title VII); job training and job creation programs; a Chicago case study of problems of access for minorities to skilled trades jobs; minority business set-aside programs and the inevitable capture by civil rights and black political leaders of the benefits from minority set-asides; Community Development Corporations; Office of Economic Opportunity; the modern-day enterprise zones; and business tax subsidies. It is to the author's credit that the book addresses the wide gamut of social solutions.

This book excels at social history and social dialogue but does less well at objective social science research. It seeks to explain the context in which each of the legislative ideas was born—such as its origins and social history—and the author

does this extraordinarily well. The book also seeks to identify the culprits (the actors who derailed the purpose of each of these policies) and whose interests dominated over the quiet and powerless interests of the urban poor. The author blames organized labor (and its effort to protect seniority) for the failure of Title VII of the Civil Rights Act, middle-class blacks for exploiting the profits of the minority set-aside programs without doling out the benefits to the underclass (the "trickle-down" effects of economics), and the Democratic Party, particularly the Democratic machine in Chicago.

There are two social policy cases in which I found Slessarev's analysis to be less than convincing. The author could have explored some alternative hypotheses or at least moderated her indictment of her "usual suspects." These cases were (1) the equal employment opportunity legislation (Title VII), with regard to which Slessarev argues that unions blocked attempts to make the civil rights act benefit the urban poor, and (2) the access of minorities to the building trades, regarding which she again argues that unions blocked the upward mobility of the urban poor. I will spend some time amplifying why the equal employment case is not as simple as she describes. The goal of that legislation in the view of many scholars was not necessarily to redistribute income from rich to poor, as the author suggests. It was to end discrimination in employment. Most congresspersons who voted for it probably conceived of it as ending overt acts of discrimination, but the courts later defined discrimination to include discriminatory effects. The legislative history would bear out this point, for example, the amendment to include "no preferential treatment" in the bill.

The major problem with Title VII compliance was weak enforcement, not the labor movement's protection of seniority. As a policy of regulating race relations (which admittedly was potentially redistributive), Title VII suffered many more severe handicaps than just the labor movement's insistence on inserting in Title VII the 703h. clause, which preserved bona fide seniority systems. The enforcing agency for Title VII, the Equal Employment Opportunity Commission, was crippled from the outset, since it had no enforcement powers until the statutory amendments to the Civil Rights Act in 1972. It had to rely on the Department of Justice to enforce the law. Enforcement of Title VII can only occur when an individual employee is brave or foolish enough to file a charge against the employer, as opposed to the automatic review of wage data that occurs in Great Britain, which increases compliance. Weakness in compliance is just one rival explanation that the author could have developed a bit more.

Another factor Slessarev ignores is labor's broader social and economic role. For example, without the support of organized labor, Title VII would probably never have been passed. Also, the role unions play in upward wage mobility for workers, especially for blacks and females, is understated in the book, except for a passing reference that Martin Luther King signed on to the union organizing campaigns for black workers in the South. Even today, union representation is a major predictor of whether black and women workers will experience the black-white or male-female wage gap or will achieve wage parity by occupation with their white male counterparts.

It also needs to be pointed out that seniority is not in and of itself discriminatory. Why do unions (and congresspersons) fight so hard to preserve seniority? Is it because older is better? No. It is because seniority is a conflict-free neutral way of distributing scarce resources, such as promotions, premium vacation days, or office space (Congress), and for eliminating the favoritism, even racism, that employers might

use as a selection criterion in the absence of seniority. I am not refuting what the author says about the practice of segregated locals. To put this practice in an accurate social historical context, however, she should give the reader some notion of just how segregated all the other American institutions were at the time, particularly the ones governed by the democracy of a white majority, such as Congress, school boards, and state legislatures.

While the courts did rule from the late 1960s to the late 1970s, in cases such as *Quarles v. Phillip Morris*, that narrow forms of seniority locked in present effects of past discrimination (hiring, for instance), three additional things need to be pointed out. First, the Supreme Court in 1977 reversed *Quarles*, a fact not mentioned by Slessarev. In *Teamsters v. United States* (431 U.S. 324, 1977) the Court upheld any seniority system which was bona fide. Second, the seniority system is neutral. Only if it is combined with point of hiring discrimination, that is, hiring all blacks into one department and all whites into another, would there be any discriminatory effects of even narrow forms of seniority. For instance, at the time the United Steelworkers of America and thirteen major steel companies signed the consent decree ending a federal court case of discrimination, the average number of years of company seniority did not differ for blacks and whites, nor did the average total earnings (counting overtime) for blacks and whites in the Alabama steel mills. Yet, some departments within the steel mills were all black and others were all white, a function of employer hiring. Third, unions are bound by the regulation of labor laws, such as the Landrum-Griffin Act of 1959, requiring that they hold democratic elections, so they are often caught on the double pincers of a white male majority constituency versus advocacy of minority rights. In summary, Slessarev blames unions for what under U.S. labor law is solely a management right, the right to hire.

I am not claiming that unions had totally clean hands, but their hands were no dirtier than other democratic, majoritarian institutions in that era. There is much evidence, not looked at by Slessarev, that union bureaucracies such as the International Union of Electrical Workers (IUE) and United Steelworkers of America did bring considerable pressure to bear on locals to comply with civil rights laws. Winn Newman, legal counsel for IUE and others, was a champion of civil rights within the labor movement, and he brought landmark pregnancy discrimination and comparable worth suits against employers in the federal courts when employers resisted Title VII compliance at the collective bargaining table. The United Auto Workers also has a much more aggressive record on social policies than is suggested by Slessarev, although her archival research on the internal review boards was certainly interesting and original. The United Steelworkers of America invested enormous resources in setting up a network of regional civil rights compliance officers solely to assist locals in complying with civil rights goals. The Textile Workers of America and Amalgamated Clothing Workers of America were successful in organizing integrated shops or majority black shops in the South, to bring the dual gain of economic and social justice to workers in Oneita Mills and J.P. Stevens, far ahead of the social curve in the Carolinas.

Thirty years after these programs, we still have urban poor. The author paints the picture a bit too starkly. I am not as certain as she that the villains would be labor, the black middle class ("Black leaders representing interests of middle class supporters was one of the four reasons why the Black economic goals were not fulfilled," p. 6), and the Democratic Party. What is clear is that Slessarev asks a very important

question and engages the social dialogue on this point. Again, kudos are deserved for keeping this ember alive.

Pasteur's Quadrant: Basic Science and Technological Innovation. By Donald E. Stokes. Washington, DC: Brookings Institution, 1997. 196p. \$38.95 cloth, \$14.95 paper.

James A. Desveaux, *University of California at Los Angeles*

In *Pasteur's Quadrant*, the author calls for a complete reassessment of the linear model of science and technology, embraced since the publication of Vannevar Bush's landmark *Science: The Endless Frontier* (1945). Stokes's farewell contribution to social science arrives at a most propitious time, as policymakers and leaders in the scientific community try to justify continued public support for science and technology in a post-Cold War environment.

Bush, who was director of the Office for Scientific Research and Development (OSRD) under Roosevelt during World War II, offered a blueprint for postwar research and development policy. He feared that unless specific safeguards were created, and boundaries established, support for basic research would give way to applied. In his book, he set about to justify the importance of publicly funded basic research and to enshrine as a matter of public policy the bifurcation between basic and applied. Stokes argues that the work, and especially the interpretations attached to it in later years, skewed our understanding about the connection between science and technology, establishing a false dichotomy. According to Stokes, though Bush argued that only those nations lending strong support to basic scientific research would remain powerful industrial competitors (through knowledge transfer to other sectors), he knew that science and technology were really quite interdependent. For instance, the United States had become one of the preeminent powers in industrial technology well before it achieved the prowess of the Europeans in basic science.

Stokes makes the point that linear thinking about how basic science feeds applied research is empirically weak. In one Department of Defense survey he cites, an analysis of hundreds of critical events contributing to the development of twenty weapons systems showed that fewer than one percent of those events owed anything to nondefense basic research, and less than 10% were connected to basic research of any kind. The author's essential point is that sometimes technology leads to and is closely tied to fundamental research, and we may find ourselves at a considerable disadvantage if we fail to acknowledge the importance of use-inspired research and development. Japan is held as the obvious example of a nation that has explicitly encouraged use-inspired research.

Pasteur's Quadrant has two primary purposes. First, it seeks to understand the logic and history behind the post-World War II science and technology paradigm and to offer a thorough critique of it. Second, and more significant, Stokes wants to substitute for this basic-applied dichotomy a different and more realistic model. He argues that all research may be characterized according to two considerations: Does it constitute a quest for fundamental understanding? Is the inspiration for it based on considerations of use? Each question forms an axis of a four-cell matrix. The book takes its title from the quadrant of the matrix describing research as driven by a quest for fundamental understanding *and* inspired by considerations of practical use. Louis Pasteur's research career illustrates the thrust of Stokes's perspective. "It deserves to be known as Pasteur's quadrant in view of how clearly Pasteur's drive toward understanding and use illus-

trates this combination of goals" (p. 74). Stokes describes fundamental research conducted in the absence of any considerations of use as "Bohr's quadrant," because the giant of quantum physics was involved purely in discovery. Research driven entirely by considerations of practical use, without concern for fundamental knowledge, Stokes terms "Edison's quadrant."

The author maintains that his two-dimensional model for thinking about science and technology makes sense for two reasons: It more accurately depicts the purposes behind the research enterprise, and it also helps us to connect the work of scientists with the larger policy implications of what they do, who should pay for it, and how and why we should care. In the process, he presents a convincing case for reassessing the conventional wisdom about basic and applied research and the relationship between science and its "downstream" applications. Much of the research in the United States is not conducted in neatly segregated strata. The interplay between basic and applied research is complex, and there *are* important distinctions within each category. Yet, there are formidable political and organizational challenges to implementing Stokes's model. One obstacle is that fundamental research is generally conducted along disciplinary lines, and departments and universities have often resisted attempts to synthesize advances in a given field with considerations of the practicality or usefulness of that research. As beneficiaries of the established paradigm, they have incentives to try and maintain it.

Another obstacle is that funding agencies must somehow justify their expenditures to Congress. When an agency like the National Science Foundation funds basic research, the choices it makes are likely to be less controversial (even if members of Congress regard those expenditures as silly or frivolous) than if the research had more obvious practical application. For instance, Washington's recent technology programs—designed explicitly with an eye toward the practical—have been labelled "corporate welfare." Furthermore, the more use-inspired the research, the more likely it is that funding agencies will seek to view the worth of projects according to their own organizational perspectives. As Stokes admits, agencies are generally careful about how they define themselves and their mission, and it is difficult to see how they would be forced to overcome their parochialism with a more catholic perspective. And congressional committees tend to reinforce this tendency for agencies to compartmentalize. Bush had advocated the creation of a National Research Foundation after the war as a superordinate agency to coordinate all research, and perhaps such an agency could help make Stokes's prescriptions a reality.

Stokes holds up the National Institutes of Health as an organizational model for successfully carrying out research in Pasteur's quadrant. NIH may be exceptional, however, in using a peer review process while taking into account the nation's medical needs in funding decisions. Though other research agencies have had their budget curtailed or have come under attack (such as the National Institute of Standards and Technology), Congress has been consistently generous in its NIH appropriations. Congress apparently has little problem with funding biomedical research that is clearly use-inspired and that may benefit downstream users, such as firms. Yet, many critics reject the idea that nonbiomedical taxpayer-funded research should benefit, say, commercial users, except as an accident.

Vannevar Bush may have understood the politics of research funding well enough to reify a distinction, and construct an artificial barrier, between science and technology in order to justify and buffer many of the research institutions in

the United States. He may well have recognized that many future research efforts would be neither entirely basic nor applied, but that the scientific community could live with this anachronism and deal with it informally.

Donald Stokes demonstrates a very deep understanding about how we got to where we are, what is wrong with and hypocritical about this dominant perspective of a bifurcated science and technology policy, and why it urgently needs reassessing. As a bonus, he offers a new paradigm in its place. The real challenge is to convert some of these ideas into a workable implementation strategy acceptable to policy leaders and dominant interests in the science and technology community. This is a fine addition to the social science literature on science and technology policy. And, consistent with his prescriptions, the author has written a very *useful* book for political, industry, and university leaders in the United States.

Faces of Feminism: An Activist's Reflections on the Women's Movement. By Sheila Tobias. Boulder, CO: Westview, 1997. 332p. \$24.00.

Martha A. Ackelsberg, *Smith College*

Right at the beginning of this fascinating analysis of the contemporary U.S. women's movement, Sheila Tobias notes that it is "not a scholar's book for scholars" but a personally engaged study, part memoir, part history. The combination is powerful and effective: She brings to the task both her own history of extensive and varied involvement in the women's movement and a thoughtful and provocative analysis of its strengths and weaknesses over time. The book is, as a consequence, an excellent resource for those wishing to understand both the trajectory of the women's movement and the larger U.S. political context in which it took place and which—in Tobias's view—profoundly shaped it.

The greatest strength of the book is its insistence on locating the movement for women's liberation within the context of late-twentieth-century U.S. politics. As Tobias notes (p. xii), "feminists may think they led a unique revolution, but in fact theirs is a classic example of democratic reform employing multiple strategies against multiple targets." Tobias takes the reader from the heady days of the 1960s civil rights, antiwar, and countercultural revolution through to the contemporary era, one—she argues—that is characterized more by backlash and retrenchment in the larger political arena and by fissures within the women's movement. In the process, she does an extraordinary job of offering a broad-ranging multicultural history of the women's movement.

The book's structure is part chronological and part topical. A first chapter sets the terms of the discussion, arguing that feminism, most basically, is about the politicization of gender. While nineteenth-century suffragists and women's rights advocates had focused primarily on gaining equal access for women to the public/civic arena, and Margaret Mead's *Sex and Temperament in Three Primitive Societies* (1935) had argued that gender roles are culturally constructed, it was Kate Millet's *Sexual Politics* (1970), with its focus on "patriarchy" as an ideology and set of practices that create and justify the subordination of women to men, that provided the theoretical grounding for what Tobias terms "the new feminism" (commonly termed the "second wave").

The chapters that follow trace the historical development of the U.S. women's movement from the nineteenth through the mid-twentieth century. The particular strength of these chapters is that they both locate women's struggles in the

context of larger U.S. political issues and movements and, even more unusually, effectively weave together many strands to create a whole. This book goes beyond what has become the conventional acknowledgment of the roots of feminism in the nineteenth-century abolitionist and twentieth-century civil rights movements to integrate the experiences, struggles, and achievements of native, African American, Mexican American, and working-class/labor union women throughout these events. What results is a truly multiclass, multicultural history of women's struggles in the United States, an achievement that, in itself, is no small feat.

In the remainder of the book (roughly two-thirds of the total), Tobias explores what she terms the three "phases" of the movement, arguing that what has characterized its history is a shift from near-unanimity among feminists about goals and strategies to the contemporary situation of ever-greater differences and fracturing. The first phase, roughly 1968 to 1972, focused on "role equity" issues, "those rooted in the moral imperative that all people, at least as far as government is concerned, ought to be treated the same" (p. 93). The role equity phase, characterized by a high degree of agreement among feminists as to what the issues were and how they should be pursued, demanded "equal access" and "equal opportunity" for women and equal treatment for women "without challenging the notion that men and women are different" (p. 94).

The second phase moved beyond role equity to what Tobias terms "role change," characterized by a questioning of traditional sex roles and attempts to create new political categories. This phase highlighted somewhat more controversial issues, such as redefining rape as assault, sexual harassment, affirmative action, abortion (and the related constellation of issues around pregnancy "disability," feminist demystifications of motherhood, and so forth), and culminated in the ERA battle. During this period, Tobias argues, while feminists remained mostly in agreement among themselves about both issues and strategy, they began to run into more effective political opposition, the most dramatic example of which was Phyllis Schlafly's StopERA. Here, Tobias offers an interesting analysis of why feminists were not able effectively to counter Schlafly's movement: They failed to understand the real anxieties of many women, could not deal with the issue of women in the military, and did not give sufficiently high priority to passage of the ERA until it was too late.

The third and final phase constitutes the contemporary one, characterized by issues on which feminists disagree among themselves. These include women in the military, comparable worth, the "mommy track," pornography, and "illegitimacy," in addition to issues such as sexual orientation, class and racial differences, and understandings of the nature and characterization of "families," topics which have divided feminists to one degree or another since the mid-1970s. Tobias's discussion of comparable worth and the "mommy track" are particularly well done, and her chapters on sexual orientation and abortion provide excellent brief histories of these issues.

The final few chapters pick up and develop on these themes of increasing difference and division. On the more "upbeat" side, Tobias offers an excellent discussion of the relation between feminist theory and feminist politics, as well as an appreciation of the scope and influence of feminist scholarship on the academy and the larger culture. The titles of the final three chapters, however, reveal Tobias's major concern: "Fissures into Fractures," "Surviving the 1980s," and "The End of a Movement." Feminism as a movement, she argues, is effectively dead: The political center in the

United States has moved so far to the right that the early successes of the women's movement can hardly be repeated. In fact, not only are feminists divided among themselves about what the new agenda should be, but also they are increasingly fighting rearguard actions to defend rights (e.g., abortion) seemingly long-since won. Even more, feminist wariness of mainstream, partisan politics may be counterproductive at the present time: Feminists, she argues, are in danger of remarginalizing themselves, just at the moment when full incorporation into the mainstream is within view. In what seems to me a strange shift from her discussions of the energy of the early independent women's movement, Tobias argues that the challenge for the future is to work out a compromise between feminist goals and mainstream political activity.

Still Seeing Red: How the Cold War Shapes the New American Politics. By John Kenneth White. Boulder, CO: Westview, 1997. 386p. \$29.95.

Howard L. Reiter, *University of Connecticut*

Most attempts to explain changes in American party politics over the past several decades have focused on domestic trends, such as race, economics, culture, and technology. In this fact-filled volume, John Kenneth White of Catholic University places Cold War considerations uppermost as a way to explain how the Republican Party climbed out from under the New Deal juggernaut, then dominated presidential elections for decades, and finally lost its presidential footing after 1991. Those Cold War factors, White points out, entailed both anticommunist ideology and foreign policy. In his view, it is far from coincidental that the end of the Cold War was followed by the first two consecutive Democratic presidential victories in thirty years.

Still Seeing Red is organized chronologically, beginning in the late 1940s and ending fifty years later. Switching back and forth between the major parties, White presents the Republicans as diverting the electorate's attention from social welfare issues in order to play to their strengths of ideological orthodoxy and diplomatic and military firmness. Only when the Soviet Union collapsed was the party left without purpose and cohesion, a disorientation reflected in the most recent presidential campaigns. Beginning with Henry Wallace and continuing through all the campaigns of the 1970s and 1980s, the Democrats proved vulnerable to charges of softness on communism and foreign policy disarray. As the Cold War ended, the voters shifted their attention to domestic affairs, with happy results for Bill Clinton. Yet, the 1990s have also seen increases in economic inequality, political polarization, and lack of common purpose. Nevertheless, White ends his narrative optimistically: "The anger that has characterized the post-Cold War political contests is beginning to ebb, and a greater sense of personal and political responsibility is gradually emerging" (p. 285).

With a wealth of telling detail, White succeeds in demonstrating that parties scholars need to qualify their explanations of political trends by taking foreign policy and anticommunism more into account. No one who reads *Still Seeing Red* should ever again ignore the important role of the Cold War in helping to shape presidential election outcomes of the past half-century. In correcting our emphasis, White has performed a valuable service.

Given the many strengths of this book, the reader wants even more. The volume is long on narrative but short on theory building and methods, and this occasions numerous questions. How, for example, does this study fit into theories

of agenda setting; under what circumstances does ideology or foreign policy rise to the top of the agenda? How did the Republicans succeed in moving social welfare off the agenda in 1952 after failing to do so in 1948? In light of Cold War references in such documents as the 1947 Civil Rights Committee report, *To Secure These Rights*, and the amicus briefs in *Brown v. Board of Education*, what are the connections between the Cold War and race? (A book whose introduction is entitled "Who Are We?" might have explored how white America's external "other" intersected with its internal "other.") Why were Republican disputes over foreign policy confined largely to the early Cold War years, while Democratic infighting crystallized with the war in Vietnam? How can we integrate into this analysis the fact that Democrats controlled Congress throughout most of the Cold War, while Republicans have dominated that branch only after the dissolution of the Soviet Union? Finally, given White's frequent citation of survey results, can careful multivariate analysis demonstrate the effects of the Cold War on party identification and presidential election voting that he claims?

Like most authors who write corrective works, White at times overstates his case. One of the charms of *Still Seeing Red* is the periodic reference to events in the lives of future leaders, but White's suggestion that it was the Cold War that first inspired the teen-aged Bill Clinton and Hillary Rodham to go into politics (p. 14) seems a stretch. White also exaggerates the dovish nature of the Democrats in recent decades. For example, his presentation of Walter Mondale's presidential nomination as a product of New Left agitation is based on selective quotation of the Democratic platform that year and ignores Mondale's call for quarantining Nicaragua. At times, too, White suggests that any reference to foreign policy, even Richard Lugar's citing of his Foreign Relations Committee experience in the 1996 campaign (p. 227), is a Cold War artifact. Finally, White might have paid greater attention to the periods within the Cold War. During its first two decades, when Soviet-American tensions were highest, the Republicans won a lower proportion of presidential elections than during the latter two decades of detente. How does this fit with White's analysis?

These questions and differences of judgment illustrate that *Still Seeing Red* is bold enough to state a clear thesis and big enough to chew on and argue with. That it is not the last word on the subject indicates my hope that it will inspire others to continue down the path White has broken. With the publication of this book, he has reminded us that it is not just the economy, stupid.

The Recall: Tribunal of the People. By Joseph F. Zimmerman. Westport, CT: Praeger, 1997. 194p. \$55.00.

Charles Press, *Michigan State University*

Zimmerman's study of recall at the state and local level supplements his previous works on participatory democracy, populism, and the Massachusetts town meeting. Its strengths are in its thorough examination of the legal aspects of recall, including relevant judicial decisions, and in the philosophical arguments for and against recall of elected officials. The author systematically and fairly presents the arguments pro and con before aligning himself with those who favor the recall.

Zimmerman opens with an overview of the recall movement. Its roots lie in the Jacksonian distrust of public officials with which its Populist formulators agreed. Its first use was in 1903 against a Los Angeles councilman, who was successfully recalled, and those who came to be supporters of the

Progressive Party of 1912 helped its spread. Opposing initially were President Taft and influential members of the American Bar Association. By 1913 it had been adopted in nine states, and now the constitution in sixteen states authorizes the recall in one form or another. Ten additional states have statutory provisions, some allowing the procedure only in home-rule cities. The chapter ends by suggesting that the present decline in voter participation has rekindled interest in forms of participatory democracy such as the recall.

Chapter 2 examines the differing legal provisions that allow recall only for cause, that is, for malfeasance, misfeasance, or nonfeasance, or that permit the voters to recall an official without giving a specific reason. The author then examines the varying provisions for petition gathering, the recall election, and so on.

Next follows a review of the few elections in which state officials, including legislators and judges, have been recalled and a discussion of the advisability of recalling judges. Zimmerman then attempts to assess the prevalence of recall at the local level, which is difficult since no central records are kept. He ends the chapter with examples of local recall elections culled from descriptions in books, magazine articles, and journals. He concludes that recall has been seldom used, despite fears of its opponents. The states most frequently using the recall are California, Michigan, and Oregon.

Zimmerman then presents the arguments pro and con and adds a final chapter, "A Model for Voter Sovereignty." He outlines provisions that state constitutions and local charters should include, in his view, to ensure participatory democracy. The discussion ranges widely from initiative, referendum, and recall to open meeting laws and other features. Finally, an extensive bibliography on recalls is appended.

The book falls short in two respects. First, Zimmerman cites only the Lawrence Sych analysis of voting patterns when

an official was recalled. Zimmerman can hardly be blamed, since few such empirical studies have been made. Sych found in a recall of a Wisconsin assemblyman that conversion of former supporters was the main factor explaining the result, and partisanship and turnout were unimportant. It appears that in a successful recall election the proponents are able to frame the issue in a way which cuts across party or other allegiances that determined the outcome of the original election. One would like to see more precinct analyses or polling of citizens of local recall elections, rather than only anecdotal reports.

Second, the author cites several times the fact that the courts in Pennsylvania and Connecticut gutted the state's recall provisions for home-rule cities. Other state courts upheld such provisions. One suspects that legislators as well, by making the provisions for the use of recall more difficult, may also be restricting its use. I think the book needed to examine in one place whether the opportunity of citizens to use recall has been increasing or decreasing. While the dates for adopting recall through 1913 are listed, I could not find such dates for the remaining adoptions. Has any state, except perhaps Alaska, adopted or expanded its recall provisions in the last fifty years or so? Have any such expansions, if they exist, only applied to recall in local elections? I note that the list of the twenty-six states that have recall in their constitution or by statute shows nineteen are west of the Mississippi, generally in areas of Populist and Progressive strength. Fifteen of these have recall in their constitution. Of the seven states east of the Mississippi, only Michigan has recall in its constitution.

Despite these caveats, Zimmerman has produced a study that students of participatory democracy will find and, in his view, public officials and citizens should find useful. It is now the major reference work on the subject.

Dilemmas of Democracy in Nigeria. Edited by Paul A. Beckett and Crawford Young. Rochester, NY: University of Rochester Press, 1997. 450p. \$65.00.

John A. Wiseman, *University of Newcastle upon Tyne*

It is a central paradox of Nigerian politics that, despite a military government for nearly three-quarters of the postindependence period, there remains a widespread and strongly held belief among Nigerians that military rule is an aberration and what *ought* to exist is a democratically elected civilian government. The tenacity of this belief is all the more remarkable given that during the two periods of civilian rule, from 1960 to 1966 and from 1979 to 1983, Nigerian democracy was deeply flawed and was marred by high levels of ethnoregional tension and corruption. This attachment to the idea of democracy as the norm has to a large extent been officially internalized by the military. Therefore, military intervention is presented by its perpetrators as an emergency response to a specific crisis, and military rule is justified on the grounds that it is preparing the way for the creation of democratic civilian rule. No regime in Nigeria has ever attempted to present military rule as a permanent fixture.

In their introduction to this excellent collection of essays, the editors suggest the insightful formulation of "permanent

transition" to encapsulate the essential features of politics in most of the postindependence period. Indeed, in his own solo contribution, Crawford Young goes even farther by suggesting that the terminal colonial period between 1945 and 1960 can be looked at in a similar light. Permanent transition has two crucial aspects. First, military regimes are legitimized on the basis of what they are (supposedly) moving toward rather than on the basis of what they are. Second, the whole convoluted process of transition enables the military to incorporate significant elements of the political class into the procedures associated with transition (drawing up constitutions, regulating political parties, and so on), thus creating "a confused and chaotic form of military-civil diarchy" (p. 5).

This book had its origins in a conference held at the University of Wisconsin-Madison in November 1995. This was a little over two years after the transition steered by President Babangida was aborted at the last minute with the annulment of the June 1993 presidential election. The conference was given added poignancy when, as it was meeting, the news came from Nigeria that human rights campaigner Ken Saro-Wiwa and eight of his colleagues had been executed by the military government. It is reported that conference participants, a large majority of whom were Nigerians, shared "a consensual understanding of the ever-increasing centrality of the question of democracy to the future of the Nigerian polity" (p. xiv). This reflects a fairly

widespread perception among observers of Nigeria, perhaps the most eloquent of whom is the Nigerian Nobel laureate Wole Soyinka, that unless the country can create a workable democracy, the most likely outcome is the disintegration of the state.

The nineteen essays in this collection cover virtually all aspects of permanent transition in Nigeria. The most detailed attention is paid to the analysis of the Babangida period and the evolving situation under Sani Abacha, but enough historical background is provided to locate recent developments within the political trajectory of postindependence Nigeria as a whole. While a chapter focusing directly on the military and its increasingly factionalized structure would have been extremely welcome, one has to recognize that this topic is probably too politically sensitive within Nigeria for the necessary empirical research to be undertaken.

Because shortage of space in this review makes impossible individual consideration of all nineteen contributions, I will focus on the most innovative and/or controversial. Two essays destined to provoke controversy for different reasons are those of Peter Ekeh and Sabo Bako. In a splendidly revisionist piece, Ekeh attributes much of the responsibility for the problems associated with constructing democracy in postindependence Africa to the failure of African nationalism to promote the rights of the individual as opposed to "people's rights." He concludes that "these meanings of freedom and democracy contributed substantially to the tyrannies that have arisen in Nigeria and elsewhere in post-colonial Africa" (pp. 91–2). Bako's essay is likely to prove even more controversial, especially among southern Nigerians. From the perspective of most of the latter, successive military regimes in Nigeria, particularly since 1983, have promoted northern/Muslim interests at the expense of southerners and Christians: Attaching Nigeria to the Organization of Islamic Conference (OIC) in 1986 is often cited as an example of Muslim bias in the government. Bako, however, argues that Babangida (himself a Muslim) operated a "systematic bias against Muslims and Muslim interests" (p. 294). This is, to say the least, an interesting and challenging view.

The essay by Oyeleye Oyediran benefits from a participant-observer perspective. The author was a nominated member of the Political Bureau, which was established by Babangida (described by Oyediran as a "wily dictator") to design his transition to democracy. The essay contains many insights, especially in relation to disagreements within the bureau, which would be denied to most researchers.

The final essay in the volume, by Olufemi Vaughan, provides a fascinating discussion of the roles of traditional leaders in Nigerian politics and their relationships with the military regimes. He is correct to stress "the remarkable adaptability and resilience of chieftaincy institutions" (p. 430), a feature often missing from accounts of Nigerian politics.

Several essays discuss the proposal whereby the presidency will rotate among political representatives from six designated ethnoregional zones over thirty years, with each zone entitled to one five-year term. Chudi Uwazurike presents this, not uncritically, as an attempt at a consociational solution to Nigeria's cleavages. This reviewer remains entirely unconvinced. First, if the level of trust and long-term confidence among ethnoregional blocs required by such a scheme already existed, then it would be unnecessary to have such a scheme. It is difficult to imagine that a bloc would be satisfied with a constitutional "turn" 25 years in the future. To date, six years is the longest that any civilian regime has survived. Second, if, as many

contributors to this volume believe, Sani Abacha plans to use the current transition, scheduled (at present!) to conclude in October 1998, as a mechanism to install himself in power as an "elected" national leader, then any confidence in long-term power sharing is bound to be a bit thin. Finally, Nigerian history provides many examples of the ability of political leaders from one ethnoregional bloc to adopt unrepresentative clients from another in order to provide some camouflage for their dominance. In the First Republic, the Northern People's Congress government coopted the Yoruba politician Samuel Akintola in order to dislodge their main Yoruba antagonist, Obafemi Awolowo. The result was a descent into violent anarchy in the Western Region.

Dilemmas of Democracy in Nigeria is a major contribution to the literature on Nigerian politics. It is essential reading not only for any scholar interested in Nigeria but also for those with wider interests in questions of democratization and military rule.

The Russian Parliamentary Elections of 1995: The Battle for the Duma. By Laura Belin and Robert W. Orttung. Armonk, NY: M. E. Sharpe, 1997. 203p. \$62.95.

Russia's 1996 Presidential Election: The End of Polarized Politics. By Michael McFaul. Stanford, CA: Hoover Institution Press, 1997. 169p. \$17.95.

Steven L. Solnick, *Columbia University*

The Russian parliamentary elections of 1995 and presidential elections of 1996 were milestones. For the first time, a democratically elected legislature and president stood for reelection in Russia without intervening violence. These two volumes, written quickly after the elections by authors who had closely tracked their progress (Belin and Orttung for the Open Media Research Institute; McFaul for the Carnegie Endowment for International Peace) serve as definitive accounts of each contest. They differ, however, in their relative success at explaining the apparently divergent outcomes of the two races.

Belin and Orttung provide a straightforward and objective account of the 1995 legislative elections, which handed the Communist Party a surprisingly large victory. The volume is well written and clearly organized, beginning with a discussion of the limited power of parliament under Boris Yeltsin's 1993 constitution and an examination of the fight over the 1995 electoral law. The authors then review the major parties that featured in the 1995 contest, the issues that dominated the campaign, and the role of the media. The final three chapters review the results of the vote. Belin and Orttung's discussion of the failure of Russian parties to consolidate in advance of the vote should add new fuel to ongoing debates about the interaction of electoral rules and party development. The Russian electoral system was explicitly designed to encourage smaller parties to merge into stable electoral coalitions. The Duma employed a hybrid system of representation in its inaugural elections in 1993: Half the 450 deputies were elected in single-round first-past-the-post races in single-mandate territorial districts, while the remainder were elected through a national-list system of proportional representation, with a threshold of 5%. In 1993, eight of thirteen parties competing in the national-list vote won seats in the Duma, while many of the deputies elected in single-mandate districts eschewed party identification altogether. The authors provide a useful summary of the complex struggle over writing an electoral law to govern the 1995 contest, as

Yeltsin's government sought to limit the number of seats filled through party-list voting. Unfortunately, the authors restrict this discussion to the arguments advanced by the Russian protagonists themselves, ignoring the extensive literature on the effects of different electoral rules. Indeed, they seem to dismiss much of this work by suggesting that "theories . . . can never accurately forecast human behavior during the campaign" (p. 10). A more nuanced consideration of comparative and theoretical work on electoral systems could have helped readers place the Russian debate in some broader context.

More significantly, the authors miss an opportunity to analyze fully one of the great puzzles of the 1995 Russian vote: Despite rules that should have fostered party consolidation, there were 43 separate electoral blocs, of which only four parties cleared the threshold of 5%. Half the electorate "wasted" its vote on parties shut out of the Duma. Belin and Orttung blame the self-destructive fragmentation on the shortsighted ambitions of party leaders, but some consideration of other cases (such as Poland, where minuscule "sofa" parties ultimately joined to form larger coalitions) would have been welcome. Yet, their narrative should at least permit future comparative studies to move beyond the largely superficial treatment afforded the Russian case in such recent works as Gary Cox's *Making Votes Count* (1997).

Despite their success in characterizing the dynamics of the 1995 campaign, Belin and Orttung occasionally resort to frustrating oversimplification. For instance, they claim that the upper house, the Federation Council, "had no choice" but to accept the compromise electoral law once its leadership revealed that the Duma would override any veto (p. 29). Yet, the inevitability of a veto alone does not explain the senators' reversal; it must be understood in the context of a Russian legislative system so anemic that both chambers must constantly struggle against appearing irrelevant. Similarly, the authors' brief discussion of why politicians fought for places on the twelve-person "federal" party list, rather than regional lists, neglects to mention why the distinction was significant. In fact, only the individuals on the federal list were assured seats in the Duma if their party crossed the five-percent threshold; the electoral law assigned deputies from regional lists according to the regional performance of their party in the vote.

The most disappointing aspect of this useful volume is the low profile of the Russian voter. Belin and Orttung focus primarily on the campaign activities of party leaders and the platforms and advertisements crafted by them. This focus suggests that party leaders were too short-sighted or venal to see the electoral advantage in consolidating in advance of the vote. The authors do not provide a basis for readers to judge why strategic voting on the part of the electorate seemed so thoroughly absent or ineffective. They devote little attention to the differences in the actual constituencies of the different parties on election day, as opposed to their targeted constituencies during the campaign. One chapter, written by Ralph S. Clem and Peter R. Craumer, considers regional dimensions of the vote in some detail, but even here the discussion is limited to the manipulation of aggregate data. Thus, it is stated that the government did better "in provinces where the population was younger" (p. 138), but any attempt to argue that younger voters supported the government would suffer from obvious problems of ecological inference.

By contrast, McFaul's crisply written and concise analysis of the 1996 presidential elections moves the Russian voter much closer to the center of the analysis. By incorporating polling and survey data, as well as unpublished documents from Yeltsin's campaign showing target vote levels by region,

McFaul allows the reader to appreciate fully the strategy that produced Yeltsin's reelection. Yeltsin's campaign initially targeted nationalist and Communist voters directly, with disastrous results. McFaul argues that Yeltsin's revamped campaign team realized that the only chance at victory was to exploit the inherent polarization of the electorate into pro- and antireform blocs and to present Yeltsin as the only credible proreform candidate. Once his non-Communist challengers were marginalized, Yeltsin could present himself as a lesser evil than the Communist Gennadii Zyuganov.

The crux of Yeltsin's plan relied on convincing anti-Communist voters that no other candidate could effectively challenge Zyuganov. In other words, though half the Russian electorate wasted its vote in December 1995, McFaul maintains that Yeltsin's victory rested on a gamble that voters would act strategically in 1996. Why did this gamble pay off? McFaul argues, in part, that the rules of the 1995 parliamentary vote encouraged party proliferation, while the 1996 presidential race encouraged polarization, but the account of the 1995 race presented by Belin and Orttung lists features explicitly designed to encourage party consolidation. More convincing is McFaul's assertion that Yeltsin simply ran a better funded and more sophisticated campaign than his non-Communist rivals. If we accept this reasoning, however, then Yeltsin's narrow first-round lead appears to have been the result of sincere rather than strategic voting.

Any verdict on the significance of strategic voting in 1996 is complicated by ambiguities in McFaul's own account of the polarization of the electorate. On the one hand, McFaul argues the electorate was cleaved into "those for the status quo and those against it" (p. 13). In such an environment, he claims, "potential 'third way' candidates had no serious chance" (p. 13), and, consequently, Yeltsin's first task was to become "the only viable candidate from the reformist camp" (p. 27). On the other hand, McFaul suggests that a pivotal 20% of the electorate could be considered "centrist" (p. 27), and he cites Zyuganov's own advisors lamenting their failure to win "new voters beyond the hard-core opposition" (p. 66). McFaul makes it clear that the logic of polarization was the key to surviving the first round, while capturing the centrists was the key to winning the second round, but his analysis would have been strengthened by a more nuanced view of the electoral bifurcation he traces back to 1991. In fact, the consistent presence of a centrist "swamp" vote throughout this period could have opened the door for a third-way candidacy, had the potential flag-bearers not been so weak and had the Communists not intensified the polarization through their own ideological inflexibility.

The real strength of McFaul's volume is his definitive account of the major campaigns. The inside stories of the Yeltsin and Zyuganov operations are dramatically told, with extensive reliance on interviews, campaign documents, polling data, and news reports. McFaul argues convincingly that the conduct of the campaigns was decisive, and that a more adept effort by Zyuganov, or a less skillful job by Yeltsin's team, could have yielded a different outcome. This is in striking contrast to the conclusion presented by Belin and Orttung that the parties' campaigns had only marginal influence on the 1995 outcome.

In his final chapter, McFaul argues that the Russian system is increasingly biased in favor of concentrated economic interests at the expense of diffuse societal interests. While this is an important point, the chapter seems divorced from the election analysis that precedes it. The role of business interests in ensuring Yeltsin's reelection—and the windfalls they reaped in its wake—are considered here, but all too briefly. Curiously, the volume concludes with extensive ap-

pendices of regional voting data that are barely mentioned in the text itself. In addition, several of the tables lack sufficient description of the data to be of much use (appendices 5 and 6, for instance, provide figures for Yeltsin's and Zyuganov's "electorates" in 1993 and 1995 without indicating which parties were grouped together for 1995 or even which national election from 1993 is presented). Despite these lapses, McFaul succeeds in combining a clear analysis of the strategic logic of the 1996 election with an effective evocation of its behind-the-scenes drama and intrigue in a slim and affordable volume.

Theft of an Idol: Text and Context in the Representation of Collective Violence. By Paul R. Brass. Princeton, NJ: Princeton University Press, 1997. 317p. \$55.00 cloth, \$17.95 paper.

Sumit Ganguly, *Hunter College of the City University of New York*

Paul Brass, one of this country's leading political scientists working on India, has written a fascinating, frustrating, and occasionally polemical book on the politics of collective violence in northern India. This work is fascinating in its detailed discussion of a number of remote incidents. In his descriptions and analyses of these events, Brass displays his substantial knowledge of the politics of caste and community in some of India's most violence-prone regions. Simultaneously, however, the book is quite frustrating, for reasons related to its analytical perspective.

All of Brass's previously published work was within the canons of empirical social science. In this book, however, Brass adopts a postmodernist perspective in his attempts to explain varieties of collective violence in India. For any social scientist trained in the tradition of empirical social science, this work poses problems. Brass provides a number of distinct accounts of a single event. In each account he attempts to show how the particular vantage point of an observer leads to the description and etiology of the eruption of collective violence. It is beyond the scope of a brief review to summarize the rich and thick description that Brass provides of instances of ethnoreligious collective violence. Instead, one such episode, dealing with a putative mass rape at a village in eastern Uttar Pradesh, shows how the national government of Prime Minister Indira Gandhi sought to exploit an allegation of police repression against poor and low-caste villagers to undermine and dismiss the elected U.P. government. Brass also shows that sections of the Indian English-language press were complicit in uncritically accepting the preferred account of the national government in New Delhi. Consequently, these "privileged" accounts, to use a favored postmodernist term, obfuscated other, more compelling reasons for the national government's seeming interest in and concern for the plight of the downtrodden. Instead of a genuine concern about police misbehavior and about the failure of the state government to enforce its writ throughout Uttar Pradesh, the centralizing regime of Indira Gandhi simply sought a pretext to dismiss a government of another party. Ironically, as Brass's deft attempt to reconstruct the events that led to the dismissal of the government shows, it is not entirely clear why a postmodern analysis of the events generates any particular insights or propositions into the workings of India's political system under Indira Gandhi.

What particular advantages, then, accrue from the adoption of this method of analysis? Brass attempts to answer this question with the standard postmodernist response: His multiple narratives underscore the contingency of various

explanations for a particular event. There is little doubt in his mind that certain events involving police brutality, state complicity, and ethnoreligious violence did occur. Yet, various narrations of the particular episode reveal the interests and power positions of those narrators. Here the postmodernist approach challenges empirical social scientists who believe that causal logic and the careful collection of evidence can enable us to apprehend the causes of a specific incident. Instead Brass argues that the "truth" of a particular event may never be discovered. All one can excavate from the detritus of communal riots and outbreaks are various versions of the "truth."

His postmodernist commitment notwithstanding, Brass demonstrates an extraordinarily fine-grained knowledge of the politics of significant portions of Uttar Pradesh and Bihar, two of India's poorest and most violent states. That said, there are some problems with the inferences that he draws from his careful study of the cases of ethnoreligious violence. His use of the term "north India" is quite deceptive. The patterns of ethnoreligious violence vary considerably throughout this sprawling region, which includes states as diverse as Jammu and Kashmir and West Bengal. In West Bengal, for instance, a Communist government has successfully contained ethnoreligious violence. In Kashmir, India's only Muslim-majority state, however, the blatant interference of the national government in the internal affairs of the state has contributed to a sanguinary, ethnoreligious, and secessionist insurgency.

Brass's propensity to make wide generalizations from a limited array of cases is more evident when he discusses the shortcomings of India's various political and social institutions. This tendency is most evident in his discussion of the role of the elite English-language press during Indira Gandhi's tenure. Brass describes the press at one point as "Goebbelsian." There is little question that significant sections of the Indian press supinely submitted to Indira Gandhi's henchmen during the "state of emergency" in the late 1970s. Yet, many editors actually courted arrest and were incarcerated for refusing to comply with the dictates of government censors. In the aftermath of that period Indian journalists have routinely exposed corruption in the highest echelons of government, revealed cruel labor practices, and focused attention on the plight of India's disenfranchised.

Brass is on far more secure footing when he develops the concept of an "institutionalized riot system." He argues that certain cities in northern India are far more prone to ethnoreligious violence owing to these sociopolitical configurations. Briefly, these riot systems involve groups of well-heeled political activists, whom Brass calls "riot specialists," who often mobilize the poor and dispossessed to organize and foment riots. In one of the more illuminating, if ultimately inconclusive, chapters of the book, he provides a fascinating account of the career and death of one such riot specialist, Kala Bachcha, in the aftermath of the brutal riots that convulsed the city of Kanpur in Uttar Pradesh. The accounts of Bachcha's exploits during the riots vary considerably. Nevertheless, Brass's careful reconstruction of the events that led to Bachcha's demise provides a compelling portrait of communal relations and violence in one mid-sized Indian city that has undergone substantial industrial decline and concomitant social change.

The utility of these concepts notwithstanding, the reader is still left with a nagging question that these postmodernist accounts fail to answer: What larger material and social forces provide conditions conducive to the emergence of "institutionalized riot systems" in distinct parts of India?

European Portugal: The Difficult Road to Sustainable Democracy. By José M. Magone. London: Macmillan, 1997; New York: St. Martin's, 1997. 217p. \$59.95.

Howard J. Wiarda, *University of Massachusetts*

Portugal in 1974 was the first country in the so-called third wave of late-twentieth-century democratizations. The "revolution of flowers" in April 1974 was followed shortly by the Greek and Spanish democratizations, then by a wave in Latin America, then political openings and greater pluralism in East Asia, next in Eastern Europe and the former Soviet Union, and finally, though weakly, in Africa and some Islamic countries. So it is appropriate, almost a quarter of a century later, to assess both the process and the outcome of the initial "transition to democracy."

There is a teleological flavor to much of the literature on democratic transitions. After the fact, the transitions always look much simpler, easier, and inevitable than they do at the time, as if the outcome were foreordained. The so-called transitologists have informed us of the strategies to be used, the pacts to be signed, and the processes and markers by which the transition becomes the *consolidation* of democracy. The literature seems too often dominated by true believers, the formula too pat, the outcomes too unilinear.

These two books on Portugal remind us of how uncertain and open-ended the process often is, even in the most successful of the recent cases. Democratization was by no means the only possible outcome in Portugal; a right-wing coup, a communist takeover, continued military rule, complete breakdown and disintegration were also conceivable. There was nothing inevitable, unilinear, or foreordained about the process. Strong leadership, political culture changes and continuities, foreign involvement and manipulation, luck, timing, and fortuna—none of which are dealt with adequately in the theoretical literature on transitions—were all important variables in the Portuguese case, from which few general rules and certainly no formula for successful transitions emerge. And perhaps we have learned by now, or should have, that the transitions away from Marxism-Leninism in Eastern Europe and the former Soviet Union are so fundamentally different from the transitions away from authoritarianism in southern Europe and Latin America that the same models and formulas cannot be indiscriminately used for both.

Both author José M. Magone, in chapter 2, and editor Thomas C. Bruneau, in his Introduction, walk us through the steps and stages of the Portuguese transition. They show us how uncertain and ambiguous the process was and how fragile the democratic outcome. The Armed Forces Movement (MFA), which staged the initial coup that ousted the long-term, authoritarian-corporatist regime of Antonio Salazar and his successor, Marcello Caetano, was not at first committed to democracy. The well-organized Portuguese Communist Party (PCP) sought to hijack the revolution, as did General Antonio Spínola. U.S. Ambassador Frank Carlucci and a number of Western European countries and parties sought to aid the democratic forces, while the Soviets and their allies supported the PCP. Portugal became a Cold War battlefield on top of the confusion, uncertainty, disintegration, and street politics reigning in the domestic situation.

Magone traces these events factually while also imposing his own teleological vision of "participatory" or "sustainable" democracy on them. Bruneau is also a committed advocate; his focus is political parties. Bruneau wants to make the case

that political parties have become *the* central actors in Portuguese politics since 1975, and his Introduction places heavy stress on their role in the mid-1970s' maneuvering for advantage and in the gradual consolidation that follows. He argues that political parties in Portugal "remain vital" and "play the central role in linking the population to government." He concludes that they are the "key political institutions in both the transition and current political process." At a broader theoretical level, Bruneau believes that, unlike much of Western Europe, parties and the party system have become more important in Portugal.

In arguing his thesis, Bruneau leaves too many questions unanswered. What is the nature of Portugal's political parties? How well organized are they? Are they mass based or more narrowly clientelistic? Are they mainly concessions to foreign (U.S., Western Europe) fads and the requirements of international assistance money, or have they really sunk roots in the Portuguese soil? Are they merely updated versions of Portuguese *personalismo*, *caciquismo*, and rival "baronies," or are they genuine political parties? The poll data available suggest that all parties have low reputations, among the lowest of all Portuguese institutions. In his eagerness to give the parties center stage and elevate them to an importance they may not have, Bruneau neglects these crucial issues.

Strikingly, the contributors to this volume are much more forthright on these more complex issues than is the editor. What Bruneau has done—and what constitutes the main value of this book—is ask three recent Ph.D.s, who wrote dissertations on the three main Portuguese political parties, to summarize their research findings. They have done this admirably in three striking substantive chapters that go considerably beyond the editor's overly pat conclusions. Carlos Cunha writes on the PCP, Juliet Antunes Sablosky on the Socialist Party (PS), and Mariteresa Frain on both the Social Democratic Party (PSD, topic of her doctoral thesis) and the Social Democratic Center (CDS, the Christian democrats). A final chapter is by Mário Bacalhao, who summarizes and updates his earlier, well-known explorations of public opinion on political parties as well as election results since 1975.

Cunha summarizes a wealth of research he has done in Lisbon, Paris, Prague, and Moscow on the PCP. In this rich chapter, he shows the overwhelming and personalistic dominance of PCP leader Alvaro Cunhal on the party for the last four decades, Cunhal's insistence on following a Stalinist course even after that had become outdated and discredited, and how that stance has hurt the party electorally in recent years. Antunes Sablosky's chapter on the PS reveals how the party was created in exile by a small elite, how dependent it was on outside advice and financial assistance (British, German, Scandinavian, and U.S. sympathizers) in its early years, and the party's deep internal divisions, the jockeying for power by different factions and individuals, and its actual "thinness" in contrast to its popular image of strength. Similarly, Frain demonstrates the weak institutional base of the PSD, the veto power of its several "barons," and its continuing clientelistic and patrimonialist features. Individually, these are rich substantive chapters, and together they present a picture of the main parties as weak and disorganized, with many striking continuities from Portugal's non-democratic past, and quite at variance with the editor's strong but perhaps somewhat wishful conclusions.

That is also the viewpoint of Margone's refreshingly insightful book. Like the younger scholars brought together by Bruneau, Magone seems not to be distracted by the conceptual and methodological disputes that sometimes sidetracked an earlier generation of Portugal, and democratization,

scholars. To be sure, he has his own point of view, a rather romantic and idealistic vision of participatory or what he calls "sustainable" democracy. He has read all the transitology literature and cites it, but he seems not to be overly impressed and, thankfully, often goes off in his own uninhibited directions.

Magone argues that the two stages of democratization, transition and consolidation, are insufficient. Instead, he insists democracy must be thoroughly *institutionalized*, that it be *qualitative*, that it reach down deeply into society to encompass basic attitudes, interpersonal and social relations, and political culture as well as institutions. Magone's other main contribution is to emphasize how much democratization and Europeanization were interrelated in the Portuguese case. By "Europeanization" he means both economic and political transformations, and he argues that the transition to democracy was also linked to the development of a more liberal, open-market economy. He emphasizes that Portuguese elites *had* to conform to international pressures both for democratization and for economic liberalization as a condition of joining the EU, which makes Portuguese democracy something of a concession to foreign pressure.

Magone has additional chapters on political parties, the local political system, interest groups, civil society, and public policy. In all these chapters, including the one on political parties, the author is less sanguine about Portuguese democracy than is Bruneau. He emphasizes that Portuguese democracy is still incomplete, often woefully so, that the outcome of the transition is still not certain, that the closer one examines the Portuguese system *below* the level of formal institutions, the more problematic it becomes. While Magone clearly has his preferences, there is no teleological outcome here, no model that has to be verified regardless of where the facts lead.

In the process Magone stresses that the Portuguese state has been restored as the main "steering factor" in development; the presidency is the only stable institution; new (but not necessarily "neo") forms of corporatism are emerging; *all* institutions (parties, interest groups, civil society) remain fragile and underinstitutionalized. He emphasizes that Portuguese institutions are still often dominated by clientelism, elitism, and patrimonialism, and hence the continuities with the past may be as striking as the changes since 1974.

Recently, some transitologists have been making a distinction between electoral democracy (by now, widespread) and liberal democracy (still quite rare). The latter may take generations to develop and requires fundamental changes in political culture as well as in institutions. By Magone's analysis, all this is still incomplete in Portugal; in his view, and those of the younger contributors to the Bruneau volume, Portugal is still a "half-way house," capitalist and patrimonialist at the same time, democratic as well as elitist, only part way along the road to genuine popular participation and equality.

Manufacturing Insecurity: The Rise and Fall of Brazil's Military-Industrial Complex. By Ken Conca. Boulder, CO, and London: Lynne Rienner, 1997. 281p. \$55.00.

Wendy Hunter, *Vanderbilt University*

Between 1970 and 1985, Brazil became a Third World leader in military research and development and a major producer and exporter of armaments. By the late 1980s, the defense sector was but a shadow of its former self. In *Manufacturing Insecurity*, Ken Conca explores the domestic and international conditions that initially promoted and later con-

strained the growth and development of military industrialization in Brazil.

In the first part of the book, Conca describes and analyzes the confluence of domestic-political and global-market forces that directed and helped sustain resources to the country's defense sector in its take-off phase, effectively insulating it from other economic demands domestically as well as global competition. Inspired by visions of technological autonomy and great-power status, Brazil's military governments (1964–85) took advantage of their ability to control crucial political and economic resources to boost military industrialization, especially after 1968. They diverted resources preferentially to the defense sector, instituted export policies supportive of it, and guaranteed a domestic market for arms when necessary. These state policies coincided with and conformed to favorable conditions in the global arms economy, including a strong demand for medium-tech arms and easily available international financing. In the boom phase of military industrialization, commercial considerations, strategic goals, and technological initiatives dovetailed nicely.

As Conca explains in Part Two of the book, Brazil's defense sector fell in the second half of the 1980s as dramatically as it rose a decade earlier. Its fall was due to the decline of the same forces that had facilitated growth. The global market for the kinds of weapons systems sold by Brazil contracted markedly when four important customers—Iraq, Saudi Arabia, Libya, and Egypt—cut their importation of arms by more than 60%. No significant new buyers emerged. At the same time, Brazil's debt crisis and weakened position with global lending agencies, such as the International Monetary Fund, hurt new investment and export-led growth in the defense sector. Foreign financing had been largely responsible for technological advances in the sector in the early 1980s. To worsen matters, the military's ability to influence the economic policies necessary to maintain and foster military industrialization (e.g., keeping defense expenditures at high levels) diminished with the transition to civilian rule in 1985.

In explaining how democratization worked against the continued growth of the arms industry, Conca makes an interesting observation. The insularity of defense production, intended by the military to minimize outside interference, cut both ways. That the sector was shielded from broader forces in society, the economy, and politics initially worked in favor of its development. Yet, the enclave structure over time precluded the support of actors (such as labor, the scientific community, and politicians) who otherwise might have played a key role in protecting the (later beleaguered) industry from demise. In this respect, Brazil's defense sector does not fully conform to what is implied by the term "military-industrial complex." In many advanced industrial countries, coalitions that have included a broader array of social, political, and economic actors have been vital in defending arms production from economic downturn and adverse global conditions.

Conca illustrates his argument with reference to case studies on four different weapons systems: the AM-X tactical fighter, the VLS satellite launcher and ballistic missile, the Ossrio battle tank, and the nuclear submarine program. These individual cases support his overall interpretation. At the same time, they show that the salience of the international and domestic structures he emphasizes varied across specific programs. For example, the military's political autonomy domestically was particularly important for the growth of the parallel nuclear program. Service autonomy, consistent political support, and international market expansion were key in the case of the armored vehicle and aeronautics industries.

In Part Three, Conca uses the Brazilian experience as a point of departure for speculating about the prospects for military-industrial development in the Third World more broadly. Given that the defense sector in Brazil ran up against severe limitations—due to factors that arms producers in other developing countries could be expected to encounter as well, and despite a context that remained relatively favorable in several other respects—Conca is skeptical about the chances for sustained military-industrial development in most of the Third World. Yet, one factor lacking in Brazil that Conca does not underscore, a significant external security threat, would seem to play a crucial role in bolstering the defense sector in such countries as India, Israel, and South Korea. While unable to answer fully all the questions he raises, Conca provides interesting food for thought and new ideas for comparative investigation in this final chapter.

In sum, *Manufacturing Insecurity* provides an excellent overview of the context surrounding the boom and bust of the Brazilian arms industry between the early 1970s and late 1980s. A model of clarity, organization, and analysis, it makes a significant contribution on an important and understudied topic. At a time when the vast majority of the literature on Latin American militaries emphasizes the changing political role of the institution, Conca's examination of recent changes in the military's ability to affect economic policymaking is refreshing and fills an important gap. The difficulty of carrying out research on military industrialization in Brazil also deserves emphasis. To his credit, the author managed to conduct about 70 interviews with participants associated in some capacity with the industry. It is indicative that he was unable to obtain interviews with officials from Engesa or Avibras, two of the largest and most important firms in the defense sector. *Manufacturing Insecurity* is recommended reading for students of Brazil in general, analysts of Latin American militaries, and those interested in military industrialization in the developed and developing worlds.

Making Votes Count: Strategic Coordination in the World's Electoral Systems. By Gary Cox. Cambridge: Cambridge University Press, 1997. 340p. \$59.95 cloth, \$18.95 paper.

Melvin J. Hinich, *University of Texas at Austin*

Every serious scholar of political systems should read this book. Gary Cox has superbly organized the theoretical and empirical literature to illuminate the complex interactions between the rules used to select the winners in a political system and the behavior of candidates, parties, and voters. He builds on the hypotheses of Duverger, which are clearly explained in chapter 2. Chapter 3 presents a snapshot of various electoral systems used in the world as of 1992. This chapter and Appendix A are great sources for anyone who wishes to study and compare electoral systems. Chapter 4 investigates strategic voting in single-member districts operating under a variety of single-ballot systems. Chapter 5 investigates multimember districts operating under various proportional representation systems. Chapter 6 investigates single-member districts operating under dual-ballot methods.

Cox is a master when it comes to explaining ideas generated by a logic-based theory. A reader with no training in game theory or decision theory can grasp the essential ideas presented in this book. Similarly, someone with no technical knowledge of statistical methods can follow the arguments based on data. There is no impediment in this book to deter someone who wants to understand what Cox is arguing.

This strength is also the main weakness of the book. It is

not clear to me what assumptions are really driving the deductions in the theory. I think that I know what is going on, since I am familiar with the theoretical literature, but the text is not sufficiently rigorous for me to check on details that are important for a rigorous analysis. Cox is a very careful and thoughtful scholar, but I have found in my own work that it is easy to make theoretical slips when striving to make difficult ideas accessible to people who are not used to precise argumentation. I am troubled by the question of how critical the equilibrium results are to the assumption that the voting games in the book have common knowledge. Common knowledge in extensive form games requires that all agents know all the moves that all the players have plus the preferences of all the players. Such an assumption is standard in modern game theory, but I question its plausibility for building a scientific theory of politics. Had Cox decided to illustrate these theoretical issues in the text he would have risked losing many potential readers.

Similarly, the empirical results leave me unconvinced, since the technical details I need to judge a statistical analysis are not provided in the book. Cox has opted for convincing readers who are uncomfortable with modern statistical methods. His results are convincing on the surface, but I have seen a number of statistical claims contradicted when confronted with hard analysis.

The core assumption about voters is that they vote instrumentally. They make some sort of calculation about the probability that their vote will improve the outcome with respect to their preference order. This type of rationality is a very strict form of rational action. All that is needed for rational action is that the decision maker behave in a consistent manner with respect to a utility function which can be measured in principle. The measurement issue rules out the tautology where any set of choices can be rationalized by some idiosyncratic utility function which strongly depends on parameters that cannot even be measured in a thought experiment.

Consider the following rational choice model that I believe will yield the same sorts of results, which Cox discusses. A person votes because he likes participating in the voting ritual. There is no need to invoke Calvinist civic duty terms into the voter's calculus. The satisfaction can depend on the closeness of the race and the choices to be voted on. Thus, the utility increase of participation is not a fixed value. Once the decision to vote is made, then "strategic" calculations only apply if there are more than two choices.

Extending this type of approach when there are more than two choices, suppose that a voter is deciding which party to vote for in an election for parliament in an electoral system with proportional representation. The voter can vote for her most preferred party regardless of whether the party has a chance to get into the parliament. But if the voter likes voting for a party which gets into the ruling cabinet as a result of coalition formation after the election, this voter will consider the likelihood that each of her top choices will be in the cabinet. This type of decision rule is not instrumental; it is subjective and is rational given the definition of rationality I have made here.

The type of rationality Cox uses is odd given the way large democracies are governed. It is not clear how major national decisions made in the District of Columbia by the various elected agents, appointed bureaucrats, and judges are driven by the outcomes of national and regional elections. Gaining utility from participation given some expectations of who will win makes more sense to me than imposing a strategic calculus on voters that is the same as is used for the active agents—the politicians and parties.

These active players in the political game get constant feedback from their moves and can learn, but a voter who actually makes or breaks a tie cannot learn that she did it. Only when voters are organized into voting blocs in which the leadership can observe voter shirking can mass politics be viewed as a coordination game using conventional game theoretic constructions.

Yet, taken as a whole, this book is a very important contribution to our knowledge about electoral systems. It will be the major book in this area for some time to come.

The State against Society: Political Crises and Their Aftermath in East Central Europe. By Grzegorz Ekiert. Princeton, NJ: Princeton University Press, 1996. 435p. \$59.50 cloth, \$19.95 paper.

Michael Bernhard, *Pennsylvania State University*

This is one of those rare works that combines a rich comparative historical understanding with a compelling theoretical framework. Ekiert pinpoints several critical junctures in the institutional evolution (1956–89) of East Central European Communist regimes following the death of Stalin. In this sense the book shares the ambitious theoretical agenda posed by Collier and Collier's *Shaping the Political Arena* (1991) for Latin America and Luebbert's *Liberalism, Fascism, or Social Democracy* (1991) for interwar Western Europe.

The three cases used to illustrate these critical junctures are the Hungarian Revolution, the Prague Spring, and the Solidarity period in Poland. It is not the crises per se but their aftermaths that are most significant in the shaping of new institutions. Thus, the dependent variable is the result of the postcrisis demobilization. Ekiert not only explains whether the party-state can secure "reequilibration" (in the sense that Linz coined this term in his work on the breakdown of democracies) but also the nature of the new equilibria. In the Polish case (1980–89) the authorities failed to reestablish equilibrium, and this was the opening that led to the democratization of the region.

In Hungary (1956–63) and Czechoslovakia (1968–76) the party state successfully restored order. Still, the nature of these new equilibria are not what one would expect, given the crises from which they emerged. The rapid uncontrolled mobilization of the Hungarian Revolution and its violent suppression by the Soviet army led to pragmatic and flexible reformist policies after an initial period of strong repression, whereas the much more limited and controlled mobilization of the Prague Spring and the considerably less violent occupation of the country by Warsaw Pact forces led to highly rigid and repressive policies. The Hungarian case was a critical juncture because it set the limits of de-Stalinization. In turn, the Czechoslovak case redefined those limits by curtailing revisionist attempts at reform. This established the institutional conservatism in the bloc associated with Brezhnev's rule in the USSR.

Ekiert comparatively analyzes each case in terms of three independent variables: the capacity of resistance or opposition movements that emerged during the crisis, the capacity and strategies of the party-state, and the international context of the demobilization period. Through the carefully controlled comparison of these variables across the cases, Ekiert provides a convincing explanation for the outcome of all three. It is the sophisticated use of the comparative method across three empirically rich case studies that is the strength of this study as a work of political science. Ekiert further demonstrates the utility of his findings by showing

how the variations in outcomes were significant for the patterns of the transition to democracy in all three cases.

The book also makes significant contributions to a revised understanding of East European communist systems. The most important point is that not the actual crises but "the stage of demobilization and reequilibration . . . left the most enduring consequences" for institutional evolution (p. 26). Furthermore, Ekiert's criticism of the conceptualization of postcrisis behavior in communist regimes as "normalization" (defined as a return to the status quo ante) and his use of "reequilibration" are strong improvements both in terms of empirical accuracy and the ability of his theory to account for change.

Ekiert's book also reiterates and provides strong evidence for a number of new understandings which have emerged over the last several years (particularly in the work of younger scholars and those who conducted fieldwork in Eastern Europe in the 1980s). While these ideas cannot be uniquely attributed to Ekiert, he is an eloquent spokesman for many of them. First, his book is yet another confirmation that East European communist regimes were far more fragile than theories of totalitarianism and posttotalitarianism led us to believe. Second, it explains East European politics as a product of the interaction of state and society, which in terms of understanding developments in the 1970s and the 1980s in many of the countries in the region (most notably Poland and Hungary), is an improvement over the more conventional Sovietological approaches that view East European politics as a product of Soviet policies, the overwhelming power of the prerogative state over a subject society, or the primacy of elites. Furthermore, Ekiert provides ample evidence for the related assertion that this state-society relationship was the major source of variation in the domestic politics of the countries of the region. Third and finally, this state-society approach highlights the importance of the domestic politics of individual countries despite political and economic dependence on the USSR. Ekiert's analysis strongly refutes the notion, often encountered in works by analysts with a passing knowledge of Eastern Europe, that democratization is only explainable with reference to developments in the USSR. What analyses such as Ekiert's point out is the significance of events in Eastern Europe for the bloc as a whole, including internal reform in the USSR. In this regard, the failure to reestablish reequilibrium in Poland was critical not only for that country but also for the demise of the Soviet bloc as a whole.

Despite many obvious strengths, the work is open to some minor criticism. For instance, the Hungarian account could have been improved by greater detail on the contours of the New Course policies introduced by Nagy and the successful efforts of the Stalinists to undermine them. In addition, Ekiert underestimates the significance of the changes introduced during the Prague Spring on a systemic level, arguing that "the reformist institutional vision . . . did not depart radically from the major tenets of the Marxist-Leninist state-idea" (p. 140). Here I differ with him and see the abolition of censorship, the introduction of the secret ballot in internal party elections, and a degree of economic decentralization as major departures in the direction of a different model of socialism. We will never know if it was a viable one due to the actions of the Warsaw Pact.

On a theoretical level I have only one quibble. Ekiert describes his analysis with three different results, I am at a loss to understand how these represent paths and not just individual developmental trajectories. Even if this is the case, Ekiert's analysis represents an insightful historicism, and this in no way undermines its many significant findings.

The book deserves a wide audience. Its exemplary use of comparison makes it significant for all those interested in

small-n qualitative methods. East Europeanists will appreciate Ekiert's attention to detail, his careful interpretations of the cases, and how he builds to a new understanding of the significance of key events in the postwar history of the region. It is also the sort of book that the many political scientists interested in using Eastern European data to test their theories of democratization, party-formation, voting, and so on, should read to develop a keener understanding of the politics of the region.

The Catholic Church and Democracy in Chile and Peru. By Michael Fleet and Brian H. Smith. Notre Dame, IN: University of Notre Dame Press, 1997. 378p. \$45.00.

Contradiction and Conflict: The Popular Church in Nicaragua. By Debra Sabia. Tuscaloosa: University of Alabama Press, 1997. 256p. \$34.95.

Philip J. Williams, *University of Florida*

These two books add to the growing literature on religion and politics in Latin America. Fleet and Smith's comparative study of the role of the Catholic church in the process of democratic transition and consolidation in Chile and Peru examines both the efforts of national church leaders and local clergy and activists. Sabia's work traces the emergence and evolution of the popular sector of the Catholic church in Nicaragua, focusing on the political and religious differences that fragmented the popular church after 1979. The two books represent distinct approaches to studying the church and politics in Latin America. Whereas Fleet and Smith adopt a more institutional perspective for understanding the church's evolving role, Sabia views the church as a "community of faithful" and focuses primarily on the grassroots level.

Fleet and Smith provide a fairly comprehensive treatment. Their theoretical approach, while not particularly novel, considers the effect of both religious and secular forces on the church's institutional development in each country. These include the church's traditional core concerns; the dominance of the institutional church model; secular challenges; and new political roles. Chapters 2 and 3 discuss the historical evolution of the church in Chile and Peru, testing a series of hypotheses based on the theoretical framework. Chapters 4 through 7 examine the church's role in the transition and consolidation phases in both countries. This is followed by a comparative analysis of the two cases and a brief discussion of possible future scenarios.

The strength of the study is its examination of the role of national church leaders in the periods of democratic transition and consolidation. In the Chilean case, Fleet and Smith provide convincing evidence that church leaders played a vital role in moving the transition forward. The Archbishop of Santiago, Cardinal Fresno, was especially instrumental in creating opportunities for dialogue between opposition leaders and the Pinochet regime. According to the authors, "the hierarchy was most influential when it was least prophetic, when it worked behind the scenes on behalf of compromise instead of denouncing evils and abuses publicly" (p. 272). Local Catholic activists also played important roles in the transition, participating in a range of social movement activities while exerting a moderating influence on the opposition movement. During the consolidation phase, the church's influence has been "modest and at times obstructive" (p. 274). The hierarchy's inflexible position on moral issues, such as divorce and abortion, has done little to cultivate democratic debate on issues of national import, while local activists have provided only "residual support for consolidation" (p. 193).

In Peru, the authors argue, the church had much less influence on the democratic transition. This had to do in part with the very different nature of the military regime in Peru, which was much less repressive than its Chilean counterpart. During its initial phase, the Velasco regime implemented a number of significant social and economic reforms intended to benefit lower-class Peruvians, some of which were supported by church officials. Moreover, divisions within the hierarchy limited to church's ability to speak with a unified voice. Likewise, local Catholic activists, while participating in opposition movements, were more fragmented along political lines than in Chile. During the consolidation phase, the church's role was even more limited. The bishops did little to contribute to the strengthening of democratic values and processes, and local lay activists received little encouragement from the hierarchy. As Fleet and Smith point out, the church's ability to contribute positively to the consolidation phase in Peru has been complicated by the political violence of Sendero Luminoso, the collapse of traditional political parties, and successive economic crises.

Although the study makes an important contribution to our understanding of the institutional development of both churches and their role in recent political transformations, the authors do not do justice to processes within the churches at the local level. The data from surveys of Catholics in Santiago and Lima are limited in their usefulness. In the Chilean case, the survey was conducted during the transition phase, but the authors provide no comparable data for the consolidation period. In the Peruvian case, the data were collected during the consolidation phase, and there is none from the transition period. This makes it difficult to compare the role of local Catholic activists from one period to the next and complicates any cross-national comparisons. Moreover, the data could have been brought to life by providing more detailed discussion of parish-level developments and including more "popular voices" in the analysis. Except for presenting excerpts from interviews with clergy and pastoral agents, the voices of "ordinary heroes" are almost entirely absent. As Daniel Levine has made clear (*Popular Voices in Latin American Catholicism*, 1992), popular religious groups can instill in their members the development of new norms, values, and leadership skills that support democratic development.

Sabia's study of the popular church in Nicaragua is a much less ambitious undertaking. Chapters 1-5 cover familiar territory. After first discussing the effect of changes in Latin American Catholicism on the Nicaraguan church, Sabia traces the emergence and evolution of the popular church, including its conflicts and tensions with the Catholic hierarchy. Most of this discussion is based on earlier studies (Michael Dodson and Laura O'Shaughnessy, *Nicaragua's Other Revolution*, 1990; Joseph Mulligan, *The Nicaraguan Church and the Revolution*, 1991; and Philip Williams, *The Catholic Church and Politics in Nicaragua and Costa Rica*, 1989) and adds little new insight. More interesting are chapters 6-9, in which Sabia examines the popular church as "a community of faithful made up of four distinct ideal types" (p. 5): Marxist, revolutionary Christian, reformist Christian, and alienated Christian. The ideal types are derived from interviews by the author with members of three different Christian base communities in Managua. Drawing from her interview data, the author tries to show how political and religious issues contributed to the growing fragmentation of the popular church along the lines suggested by her typology. One of the most interesting insights of the book is the relative weight of revolutionary Christians within the popular church. According to Sabia's findings, reformist Christians, who

exhibit moderate views on both political issues and their relationship with the church hierarchy, clearly outnumber the revolutionaries. Consequently, the overwhelming majority of base community members are much less partisan than once thought and are more likely to exert a moderating influence on the popular sector of the church. These findings are similar to those of Fleet and Smith concerning the political and religious views of local Catholic activists in Chile and Peru.

Two of the ideal types used by Sabia are particularly problematic. Marxists, for example, no longer consider themselves Catholics. Some participate in the social projects of local base communities but are not practicing Catholics. If this is the case, then how can members of this group even be considered part of the popular church? The alienated Christian type is too broad and diffuse to be a useful analytic category. This group includes rich and poor, some who support the archbishop and others who do not, charismatics and recently converted evangelicals, ardent anti-Sandinistas, and those who have withdrawn from politics altogether. What becomes clear in Sabia's discussion of alienated Christians is the growing importance of new religious movements in Nicaragua. Whereas the popular church has been in a long period of decline, the charismatic renewal movement and evangelical Protestantism have experienced a boom in recent years.

The scant attention paid to new religious movements is a weakness of both these studies. As other scholars of religion in Latin America have argued (John Burdick, *Looking for God in Brazil*, 1993; Rowan Ireland, *Kingdoms Come*, 1991), the religious arena has become increasingly contested of late. Even within the Catholic church, an incredible explosion of new religious lay movements has added to the complexity of the church. The challenge for future studies of religion and politics is to make sense of the growing religious diversity of Latin America and its potential political significance for the region.

Ethnic Conflict: Commerce, Culture, and the Contact Hypothesis. By H. D. Forbes. New Haven, CT: Yale University Press, 1997. 304p. \$30.00.

Milton J. Esman, *Cornell University*

The academic literature on ethnic conflict addresses two problems: the causes of ethnic conflict and how they can be managed or resolved. This book explores the first of these problems and also aspires to demonstrate the limitations of empiricism in the social sciences. It is intended for professional social scientists, not for concerned laymen or undergraduates. Much of it surveys and evaluates the treatment of ethnic conflict by other scholars, its style is rigorous and astringent, and it contains little empirical information. With its critical insights on much of the literature in several disciplines and its suggestions for expanding the range of current explanations, this book is a significant addition to scholarship and to efforts to deal intellectually with one of the most intractable phenomena in world affairs.

Forbes's main thrust is an attack on "contact theory," the widely held common sense intuition that increased contact among members of different ethnic communities increases mutual understanding by breaking down stereotypes, thereby eliminating the source of ethnic suspicions and conflicts. This view continues to be popular among laymen, public officials, social workers, and social scientists alike. Its many versions range from popular ditties, such as "Getting to Know You,"

to the conviction that foreign trade reduces conflicts among nations, to the extensive body of scholarship produced during the past half century by social psychologists ascribing ethnic and racial prejudice and discrimination to misperceptions of reality about other people. In the absence of such prejudices, ethnic-based conflicts would presumably disappear. The author then demonstrates that the fatal methodological flaw in this large and influential body of literature lies in confusing individual with collective phenomena. At the individual level and under some circumstances, greater contact may mitigate hostility, but at the aggregative level different dynamics prevail, and hostility stems from real differences of group interest.

This insight gives rise to the main counterhypothesis to contact theory: Far from being psychiatric in origin (false perception), ethnic conflict tends to be a rational response to competing group interests. These competing interests can be economic (land, capital, jobs, business opportunities), political (participation in public affairs, including voting and access to government services, resources, and offices, both civil and military), or cultural (relative status of religion, language, and public festivals). The competing interests hypothesis, with its rationalistic bias, has won broad support among sociologists, political scientists, and, of course, economists.

Forbes then posits a logical flaw in both of these explanations of ethnic conflict: There is nothing distinctively ethnic in either hypothesis. Why, then, should such nonethnic causes give rise to ethnic rather than to other possible expressions of conflict? To resolve this problem, he proposes an alternative explanation inspired by the late Karl Deutsch's treatment of modern nationalism. This "linguistic model" traces ethnic conflict to competing struggles for collective self-esteem among ethnic groups in contact, the impulse of each to prove its superiority and ensure its survival by imposing its way of life (especially its language and culture) on others, one method being the assimilation of outsiders into their community. Thus, the greater the contact, the greater the likelihood of conflict. Contrary to the main tradition in the modern social sciences, Forbes contrives an explicitly ethnic explanation for ethnic conflict. Among the practical, counterintuitive implications of this hypothesis, the author suggests that, "as the world shrinks and contact increases, assimilation will always lag behind the development of [ethnic] conflicts, so that more and more resources will have to be devoted to repression and education" (p. 208). Thus, with globalization, the spread of North American democratic culture may have to be implemented by increased repression.

The author devotes many pages to his convincing, though repetitious, efforts to undermine the contact hypothesis and to demonstrate that its failure can be traced to excesses of empiricism in the social sciences. To this reader, his critique of social science methods is less instructive than his analysis of theories about ethnic conflict. I would have felt rewarded had he extended his inquiry to an evaluation of the social constructionist explanation of ethnic solidarity and ethnic conflict, since this postmodernist approach has gained a wide following, especially among younger scholars. My suspicion is that most adherents to the social constructionist persuasion, with its emphasis on the fluidity and contingency of ethnic solidarities, would find Forbes's explanation, with its assumptions about the robustness of ethnic solidarities, quite unacceptable. To this reviewer, by contrast, the main contribution of this book is the hypothesis that recognizes ethnic solidarity as an independent variable, as an explanation in its own right

of ethnic conflict, rather than ascribing it entirely to extraneous psychological, economic, or political forces.

Russian Civil-Military Relations. By Dale R. Herspring. Bloomington: Indiana University Press, 1997. 272p. \$35.00.

Mark Kramer, *Harvard University*

Civil-military relations in newly democratizing states of the Third World and in the former dictatorships of southern Europe, especially in countries that were under military rule, have attracted a good deal of attention among Western scholars. But the role of armed forces in countries that once belonged to the Warsaw Pact have received much less attention. Recent books about the post-Communist transformation of Russia, the main successor-state to the Soviet Union, have barely mentioned the civil-military relationship, much less analyzed it in any detail. The lack of attention to this issue has left a gap in our understanding of the Russian political system and the problems of democratization in Russia.

Fortunately, important groundwork for an assessment of the army's role in Russian society has now been laid by Dale Herspring, who has long been one of the most perceptive Western analysts of civil-military relations in former Communist countries. He is the author of many books and articles about military politics in the Soviet Union, East Germany, and Poland. His latest book builds on his earlier works.

In a brief introduction, Herspring reviews the three main models devised by Western scholars to analyze civil-military relations in the Soviet Union: the conflictual model associated with Roman Kolkowicz, the institutional-congruence model associated with William Odom, and the participatory model elaborated by Timothy Colton. Herspring's earlier publications compare and test these models at some length, and his purpose in this latest book is twofold: reassess their utility for an understanding of Soviet-era military politics, and see whether any of the three schemes (or some other models) are helpful in analyzing civil-military relations in postsoviet Russia.

Following the Introduction, the first eight chapters cover two periods of great upheaval in the Soviet era: the 1920s, when fierce debates emerged about military doctrine and the proper role of the newly created Red Army; and the late 1980s and early 1990s, when the far-reaching changes launched by Mikhail Gorbachev engulfed the army. Most of the issues and events covered in these chapters have been discussed, in one form or another, in Herspring's earlier work and in other recent books by Western and Russian scholars, but here they are concisely summarized to provide a baseline for the preliminary assessment of civil-military relations in postsoviet Russia, which forms the next two chapters. In a concluding chapter, Herspring returns to the three models he discussed at the outset to determine whether they are of any use in understanding those relations and the evolving role of the army.

Herspring's discussion of Soviet-era military politics is lucid and well done, but his decision to focus solely on the 1920s and the Gorbachev era leaves out the most disruptive period of all for the Soviet armed forces (the violent purges of the 1930s) and the years of greatest triumph for the army, in World War II. Although Herspring's analysis of the 1920s reveals illuminating parallels with the issues now confronting Russia's army, newly declassified archival materials have shown that even in the 1950s and 1960s the army was bedeviled by many of the same problems that afflict it today.

It would have been worthwhile if Herspring had drawn on declassified documents and the plethora of new memoirs, including books by former high-ranking officials in the Soviet and Russian Ministry of Defense. A vast amount of once-secret material is now available in Moscow and through Western microfilm projects and repositories, such as the Cold War International History Project and the Harvard Project on Cold War Studies. The use of these materials would have further enriched, and perhaps refocused, the book's analysis.

Herspring's brief overview of the transition in 1991–92 from the Soviet Army to the Russian Army and his discussion of civil-military problems between 1992 and mid-1996 is a valuable starting point both for scholars of civil-military relations and for those who want to understand the uneven process of democratization in Russia. It is unfortunate that these two chapters are so compact—just 29 pages in total—because they provide an insightful look at the complex civil-military interactions in Russia. Some key episodes, notably the August 1991 coup attempt, the October 1993 showdown at the Russian parliament building, and the war in Chechnya, are covered in only the barest detail. The effect of these events on civil-military relations was so great that a more extended discussion would have been in order. At the same time, Herspring is justified in dealing at some length with the adverse effect of defense budget cuts, the sharp decline in morale, and the deep rifts that have emerged within the military. These sections provide an admirable summary of complicated events and trends.

Herspring convincingly argues that the three models of Soviet military politics, especially Kolkowicz's and Odom's, are inadequate not only when applied to the Soviet Union, but also and even more, when applied to Russia. He rightly points out that only one of the models (Colton's) was of even limited use in analyzing periods of rapid change. The deficiencies of these approaches lead Herspring to question whether it is really worth trying to come up with a new model for the study of civil-military relations in Russia. He does not deny that, at some point in the future, new models and theoretical concepts could prove useful, but he doubts that meaningful generalizations will be feasible until the political situation in Russia stabilizes and the army "begins to take on more of the characteristics of corporateness and cohesion of the old Soviet military" (p. 190).

Herspring's caution and skepticism are well taken, but his criteria are too stringent. The book's epigraph is a remark by Samuel Huntington that "one measure of a theory is the degree to which it encompasses and explains all the relevant facts." Herspring doubts that any model or theoretical approach can "encompass and explain all the relevant facts" in the turbulent and unstable climate of Russia. The counter to this, however, is that theories can be useful even if they do not explain *all* the relevant facts. Well-constructed theories of civil-military relations can facilitate comparative analyses (both temporally and on a cross-country basis) and can shed light on patterns and events that would otherwise seem random or inexplicable. Careful tests will show whether these theories are in fact useful means of analyzing military politics in Russia and elsewhere.

Despite the brevity of Herspring's book, it provides a cogent and well-informed point of departure for those hoping to understand the role of the army in Russia's post-Communist transformation. It will be especially useful for courses in Russian politics and twentieth-century Russian history.

Post-Marcos Politics: A Geographical and Statistical Analysis of the 1992 Presidential Election. By Carl H. Landé. Singapore: Institute of Southeast Asian Studies; New York: St. Martin's, 1996. 171p. \$49.95.

Jeffrey M. Riedinger, *Michigan State University*

Carl Landé offers Southeast Asian scholars another seminal contribution in this quantitative analysis of the 1992 Philippine presidential elections. Combining aggregate data from provincial and city-level electoral returns and agricultural and population censuses, he provides an in-depth geographical and demographic analysis of the election. Landé finds that, for most of the seven candidates, linguistic-regional loyalties were more important in explaining their electoral support than other demographic characteristics, such as socioeconomic status, educational attainment, or religion. The analysis also reveals two splits within the 1992 electorate: between former supporters of presidents Marcos and Aquino and between the political left and the more conservative mainstream. Landé expects only the latter schism to endure. Building on the data analysis, he surveys the development of Philippine party politics before and after the period of authoritarian rule under Ferdinand Marcos. Philippine elections in the post-Marcos era have been typified by a breakdown in the relatively stable two-party system which characterized premartial-law politics. The author concludes that, in the near term, Philippine party politics will be marked by continued instability. Coupled with the checks and balances of the constitutional separation of executive and legislative powers, this instability will result in weak and divided central government.

Landé complements the basic presentation of electoral data with both simple correlational analysis and semipartial correlational analysis. The former measures the degree of covariation between the percentage of vote each candidate received by province and 37 demographic and ecological variables. The latter measures the degree of variance in votes received as explained by the same demographic and ecological variables after controlling for the influence of the other variables. The methodological discussion is readily accessible to readers with limited knowledge of quantitative analysis.

Linguistic differences in the Philippines predate Spanish colonial rule. As used in the home, no single language unites more than one-third of the population. These linguistic differences were the strongest single predictor of voting patterns in the 1992 election. Regional support for native candidates, or for nonnative candidates who enjoyed strong backing from leading regional figures, was also crucial to the electoral outcome.

Despite the importance of linguistic-regional characteristics in the 1992 election and the very poor performance of the most issue-oriented candidate (Jovito Salonga), Landé identifies a series of small steps in the evolution of Philippines politics from voting based on linguistic-regional characteristics to issue-based voting. This evolution reflects the decentralization of government activities under the Local Government Code of 1991 and the resulting increase in the importance of local elections and the independence of local politicians, coupled with urbanization and the increasing educational attainment of the populace. Self-described cause-oriented nongovernmental organizations and a fledgling progressive party hope to build on these dynamics to advance issue-based politics, beginning with local and provincial elections.

Some of the data and findings are consistent with the patron-client explanations of Philippine politics, which Landé helped pioneer in the 1950s. Other data and results are at

odds with such analysis. Landé posits that there has been a shift from traditional patron-client politics to machine politics predicated on short-term material rewards. Unfortunately, the patron-client explanation cannot be fully tested with the aggregate data available to Landé. These tests will have to wait for individual voter data, such as would be gathered in exit polls. The aggregate data also do not permit analysis of the influence of characteristics evenly distributed across provinces, notably gender and age. Nor would the analysis reveal the effect of factors equally influential across all provinces.

Conspicuous by its omission is any extended discussion of the influence of electoral rules. The author focuses only on the use of blank (write-in) ballots and the timing of elections. Voters often complete their ballots by relying on sample ballots distributed by local leaders, a practice which Landé argues strengthens subnational politicians in their dealings with national political figures. The write-in ballot also advantages national candidates with public visibility, such as media and entertainment personalities. The author also suggests that the holding of simultaneous local, provincial, and national elections in 1992 had a negative effect on party loyalty, as it undermined reciprocity between local and national candidates. He finds little connection between the electoral success of political parties at the local or provincial level and the relative success of the parties' candidates in the presidential contest. This is unsurprising, given the weak history of party discipline in the Philippines. More striking is Landé's failure to reference the growing literature on the institutional and policy consequences of various electoral systems (e.g., Matthew S. Shugart and John M. Carey, *Presidents and Assemblies: Constitutional Design and Electoral Dynamics*, 1992). Even the debates over the relative strengths and weaknesses of presidential versus parliamentary systems receive modest attention. This is particularly notable given that proposals to switch to a parliamentary form of government have been very actively debated in recent years in the Philippines, as they were shortly before Marcos declared martial law in 1972. These debates have made little reference to comparative experience in other countries or to the scholarly literature. In ignoring this literature, Landé missed an important opportunity to inform these discussions.

On a minor note, Landé relies heavily on map presentations of the electoral data. In following the accompanying narrative, readers unfamiliar with the Philippines would benefit from a map of all the provinces, appropriately labeled.

These shortcomings notwithstanding, Landé's study represents a significant advance in the scholarship on Philippine electoral politics. Although well suited for use in advanced Asian politics courses, it should be complemented by more theoretical texts on electoral institutions.

Capital Ungoverned: Liberalizing Finance in Interventionist States. By Michael Loriaux, Meredith Woo-Cumings, Kent E. Calder, Sylvia Maxfield, and Sofia Perez. Ithaca, NY: Cornell University Press, 1997. 234p. \$39.95 cloth, \$15.95 paper.

Ethan B. Kapstein, *University of Minnesota*

Now that reregulation of international capital flows is once again an acceptable topic of policy debate, we are led to ask why many states around the world took the decision, during the past two decades, to abandon their interventionist policies of domestic credit allocation. This book provides an excellent place to look for answers. Loriaux and his col-

leagues examine "the end of credit activism" in Japan, South Korea, Mexico, France, and Spain, and in the opening and concluding chapters Loriaux situates these case studies in international perspective.

Inspired by Peter Katzenstein's *Between Power and Plenty* (1978), Loriaux seeks to establish the linkage between systemic events and national policies. Unlike Katzenstein, however, who asked why the 1973 oil crisis produced such different policy responses in the industrial countries, Loriaux seeks to induce a systemic story from the common threads found in each case. Examining the policy shift from interventionist to more market-oriented credit allocation schemes in countries as different as Korea and Spain, Loriaux infers "that the force driving that process . . . must have had roots in the evolution of the broader global political economy" (p. 2).

That proposition, in turn, suggests to Loriaux two possible explanations. The first is the neoliberal study of autonomous international market forces constraining the policymaking capacity of domestic financial institutions. The second is the hegemonic story of a heavily indebted United States seeking to promote "free market" financial policies to serve its own needs for deficit financing. It is this latter possibility of "predatory hegemony" that Loriaux finds most compelling.

Do the country cases support this particular systemic argument? The answer is: not completely. To begin with, the methods adopted here may be suspected of selection bias, so that in the best of circumstances we would have five studies that confirm the Loriaux hypothesis. But this is not the empirical result. Indeed, with the exception of the chapter on South Korea by Woo-Cumings, and to a lesser extent Calder's chapter on Japan, the U.S. government does not figure very prominently here at all. In the cases of Mexico, France, and Spain, other factors, including domestic and regional politics, are of equal if not greater weight in explaining the decision for liberalization.

Furthermore, when we extend the data set, the hegemonic argument must be qualified by the fact that many countries around the world, including Brazil, Chile, China, and India, continued to use capital and credit controls during the period under study (roughly the mid-1970s to mid-1990s) to meet their economic policy objectives. If America was so concerned by its relative decline and so intent on developing international policies that would stem that fall, then it might have been expected to focus its power on its principal systemic and regional challengers.

What, then, do these case studies tell us? Calder's analysis of Japan reveals a country that within one generation moved from capital scarcity to tremendous liquidity. With that liquidity, industries and entrepreneurs were no longer dependent on the state for finance, and they began to engage in independent investment programs. The plenitude of credit, in turn, led to Japan's speculative bubble, which burst at the end of the 1980s, leading to new pressures on the state to reregulate the financial markets. That intervention, as we have seen, has been fitful at best, but it has certainly been associated with liberalization, encouraged by a United States that wanted access to Japanese financial markets.

In her chapter on South Korea, Meredith Woo-Cumings makes the strongest of the hegemonic arguments. She writes that, given South Korea's position as a front-line state in the Cold War, it is "not surprising" that the country's political economy "is critically influenced by events that occur in New York and Washington" (p. 91). She describes in detail how U.S. officials applied pressure on Seoul to open its markets in trade and finance to American firms. Even in this case, however, she admits that Washington has only been partially successful and that the reform process is far from complete.

That would seem to be the case with much of East Asia, even following the financial turmoil of 1997–98.

The limits of American hegemony are most powerfully seen in Sylvia Maxfield's study of Mexico. There, despite pressures that must have been no less strong than those faced by Seoul, Mexican officials successfully negotiated financial market opening in a way that satisfied the demands of domestic bankers. The impetus to that opening was driven in the first instance by the debt crisis which began in 1982, rather than by any particular directives coming from Washington, and over the following decade Mexico's first priority was to reestablish its credibility with foreign investors. Remarkably, despite a substantial relaxation of barriers to entry, and the negotiation of the North American Free Trade Agreement, U.S. banks have been "disappointed" by the degree of opening achieved (p. 117).

Loriaux traces French financial market liberalization to the 1970s, with the collapse of Bretton Woods and the oil crisis placing severe inflationary pressures on the economy. But this is curious, since he points out that the response of the Giscard d'Estaing government was decidedly interventionist. In fact, it was not until Mitterand's failed experiment with financial sector nationalization that the Socialists reversed the interventionist course and began to liberalize. This, however, was as much a consequence of European political economy, and especially the single currency project, as it was of American hegemonic demands for open financial markets (though one might, of course, trace European monetary integration to America's "predatory hegemony").

With respect to Spain, the systemic case is even weaker. Perez does not ignore international factors in promoting Spanish liberalization, but she emphasizes the ongoing domestic debate between political reformers and bankers in advancing this project. Profiting from the inflationary environment, Spanish bankers had little interest in the real economy, and they were generally capable of frustrating most reform measures. It was not until Franco's fall from power that serious efforts at liberalization could proceed, and these were subsequently aided and abetted by European Community membership.

As with Katzenstein's *Between Power and Plenty*, we are thus left to ask: How important are international pressures on nation-states after all? To be sure, we do seem to have a significant degree of policy convergence at work here: Increasing capital liberalization is certainly one of the major recent developments in the international political economy. But whether this can be traced to predatory hegemony is a different story. A contrasting view might focus instead on what Waltz called the "socialization" function of the international system. Observing the success of the Thatcher-Reagan reforms in generating economic growth following a period of stagnation, a growing number of states may have sought to mimic that liberalization strategy to the extent possible within their own domestic political constraints.

Russia's Politics of Uncertainty. By Mary McAuley. Cambridge: Cambridge University Press, 1997. 351p. \$64.95 cloth, \$24.95 paper.

Alfred B. Evans, Jr., *California State University, Fresno*

McAuley has undertaken an ambitious enterprise, since her study delineates changes in politics that have occurred in six widely separated locations in Russia after the disintegration of the USSR. This is one of the first works by a single author comparing simultaneous trends in several regions of the Russian Federation. The six locations on which she focuses

are the republics of Tatarstan and Sakha (Yakutia), Krasnodar territory, the regions of Perm and Tomsk, and the City of St. Petersburg.

In the early 1990s, with the undermining of Communist Party authority and the breakup of the Soviet Union, a large number of studies described changes at the level of the central government of Russia, while a few writers explored trends in Moscow and St. Petersburg. More recently, a small but growing number of researchers have analyzed changes in authority and policy at the regional level in Russia. McAuley's book must be considered a major addition to that body of scholarly literature. She should be commended for her diligence in traveling widely within Russia, carrying out countless interviews of local officials, and reading a large volume of articles published in the newspapers of various cities. The result is a richly detailed and perceptive study, which demonstrates that many regional leaders have been adept at defending their interests as the authority of the central government weakened and the rules of the game of politics changed rapidly.

The paradox revealed by McAuley's investigation is that while much has changed in Russian politics during recent years, much continuity with the practices of the Soviet period is also evident. Politicians who have retained power at the regional level, as well as the few challengers who have unseated incumbents, have "relied heavily upon closely knit local and personal networks" (p. 18; see also pp. 243-4) in order to gain their objectives. Because of the collapse of the authority of the Communist Party of the Soviet Union, which encouraged the cultivation of personal linkages but maintained some institutionalization of the transfer and exercise of power, and also because neither parties nor other institutions are strong enough in the post-Soviet environment to share or limit the power of government leaders, the importance of patron-client ties has been heightened. In the absence of the cultural and institutional infrastructure of democracy, the adoption of new constitutional rules ostensibly designed to secure democracy has had the unintended effect of bringing the competition among political clans and machines into the open. One of McAuley's most important contributions is her convincing description of the manner in which the privatization of economic enterprises, by assigning regional government executives "responsibility for the distribution of valuable resources" (p. 247), enhanced the role of local political elites rather than furnished a base for more energetic competition among independent political interests. A valuable insight is McAuley's appreciation of the degree to which the post-Communist Russian state still penetrates society, influences the pattern of its growth, and shapes the expression of its political interests.

McAuley reports that at the level of the region and the large city in post-Communist Russia, power has gravitated to the government's executive leadership; that much of the burden of providing services to the population has shifted down to the regions and the local governments; that regional leaders spend a great deal of time in Moscow, making deals with central leaders; that the regional press has been largely tamed by its lack of financial independence; that regional legislative bodies, whether they struggle with the regional executive or remain docile, are highly ineffectual; that industrial enterprises are the bases of the most influential lobbies in regional politics; and that political party identification and ideology of candidates have little effect on the voters in regional elections. Her study shows that regional elites proved able to bend new rules and adapt new institutions to their advantage. She concludes that by the middle of the 1990s in each locale she studied, regardless of whether the

politics of the region had been competitive or consensual at the end of the Soviet period, "the party of power, of the administration, emerged as the dominant authority" (p. 312). She summarizes her study with the statement that institutional changes aimed at bringing democratic processes "will not in themselves create an open and competitive politics. On the contrary, they may well allow an existing elite to secure its position, and, at a time when rule enforcement breaks down and the future is uncertain, inherited conventions of behavior will play a crucial role" (pp. 312-3).

McAuley's study must be welcomed as a highly informative addition to the literature on post-Soviet Russian politics. Yet, the Introduction does not set forth a comparative framework of generalizations concerning her area of research or present clear hypotheses to be tested. The fact that McAuley began her research when there was virtually no scholarly literature on change in regional and local politics in post-Communist political systems helps explain her relatively open-ended approach to the subject. Even so, her intriguing concept of "semi-corporatist politics" (pp. 175, 219) deserves fuller explanation. It must also be pointed out that although her statements about regional executives, legislatures, parties, and voters touch on a number of points dealt with by Adrian Campbell, Jeffrey Hahn, Peter Kirkow, Blair Ruble, Darrell Slider, Kathryn Stoner-Weiss, Marc Zlotnik, and others during the last few years, McAuley does not adequately show whether her findings confirm those scholars' conclusions. Though the book appeared in print in 1997, McAuley does not take into account most of the writing on regional politics in Russia published after 1994. Nevertheless, her work must be acknowledged as a pioneering study of indispensable value to those who wish to understand politics below the national level in the Russian Federation. The book is of broad significance because McAuley helps answer the perplexing question of why the nascent, vigorous social pluralism in the Russian republics during the late 1980s was replaced by the feeble political pluralism of the Russian Federation during the middle and late 1990s. McAuley sees the answer to that question in the weakness of the institutions of "political society" and the persistence of the state's domination of civil society.

Peronism without Perón: Unions, Parties, and Democracy in Argentina. By James W. McGuire. Stanford, CA: Stanford University Press, 1997. 388p. \$55.00.

J. Patrice McSherry, *Long Island University/Brooklyn*

What explains Argentina's recurrent failure to consolidate a democratic political system? This political puzzle has engaged scholars for decades, producing a number of explanations. James W. McGuire suggests that Peronism's self-definition as a movement rather than a party has been a key source of Argentina's instability. He sets out to show that Juan Perón's legacy of "movementism" and indifference to party building led to weak institutionalization of the Peronist party, with negative implications for consolidation of Argentine democracy. McGuire presents a detailed analysis of the intricacies of politics in the Peronist trade unions and in several incarnations of the Peronist party within the broader tapestry of Argentine twentieth-century history. Perón and today Carlos Menem, McGuire asserts, have preferred to use personalistic control, "balancing" strategies, and the resources of loyal unions and the state rather than party structures to carry out political projects and dispense patronage, in order to solidify their own political dominance and prevent opportunities for rivals to gain independent power.

Only when Perón was abroad, between the mid-1950s and early 1970s, did party-building projects by powerful new figures (such as Augusto Vandor of the Metalworkers Union) commence, producing the beginnings of routinization and institutionalization of Peronism.

The author concentrates on two historical periods, 1962–66 and 1984–88, when sectors of Peronism tried, but failed, to better institutionalize Peronist party structures. In the first period, these failures meant that large sectors of Argentine labor had little stake in a democratic framework and legislative institutions—one factor that set the stage for military coups, McGuire argues. Another such factor was the “veto politics” of Peronism and its attendant use of nonparty channels to articulate interests, including mass demonstrations, strikes, factory occupations, and direct negotiations with other corporatist actors. In the second period, attempts by the renewal wing of Peronism to routinize and democratize the party were thwarted by internal power struggles as Menem, Lorenzo Miguel, and Antonio Cafiero jockeyed for leadership. McGuire’s basic theme is that Argentina’s history might have been quite different if Peronism had built an Argentine version of Britain’s Labour Party. Incentives for supporting military coups might have decreased, incentives for supporting democracy increased. The argument is reasonable, though not without limitations.

McGuire calls his model for understanding Argentina’s democratic instability a distributive conflict-party institutionalization approach. His argument clearly evokes Samuel Huntington’s, although McGuire defines institutionalization differently. He specifies three components: value infusion, taken-for-grantedness, and behavior-shaping capacity, and he finds that the first has causal priority. Institutions must be valued before they can be taken for granted; and until they are taken for granted, they do little to shape behavior. Peronist leaders have rarely infused the party with value, McGuire argues. His definition of democracy is explicitly disaggregated from social justice; his minimum requirements are that leaders be chosen in fair, competitive elections in which all citizens may participate; that nonelected agents are not able to veto policy decisions; and that citizens have civil and political rights (p. 13). In McGuire’s conceptualization, democracy may gradually improve in breadth, depth, and range over time. McGuire posits that a democracy is consolidated when its quality exceeds the procedural minimum and when it has achieved a fair degree of institutionalization. Following Juan Linz, McGuire identifies consolidation with taken-for-grantedness and behavioral influence; democracy becomes “the only game in town.”

McGuire’s depiction of Peronist party and union politics is authoritative and lively, with much useful and original data and a good intuitive sense of Argentine unionism. *Peronism without Perón* is doubtless one of the best recent analyses of the subject, and it is especially good on Perón’s legacy and on the politics of Peronism in the 1980s. The explanation of Menem’s successful efforts to weaken the Peronist party adds an important element to understanding the erosion of some democratic institutions and practices that has accompanied the current president’s economic restructuring.

Despite the important contributions the book makes to our understanding of Peronism, some of McGuire’s conceptual arguments are less persuasive. First, McGuire more than once implies that unmediated expressions of labor mobilization provoked or set the conditions for coups (although he backs away from this view in the concluding chapter). He argues that the failure of Vandor’s party-building project helped to precipitate the 1966 coup (pp. 112, 147). McGuire draws a distinction between Chile and Uruguay, countries in

which parties and parliaments were more institutionalized, and Argentina (p. 33). Yet, the former countries also succumbed to military dictatorship, at nearly the same time as Argentina (1970s), weakening the argument that lack of party institutionalization was a central determinant for democratic breakdown.

By focusing on the institutional and state levels of analysis to the near exclusion of the international level, McGuire underanalyzes crucial factors that contributed to the wave of military coups in the 1960s and 1970s, especially the Cold War context, the influence of U.S. counterinsurgency strategies, and the rise of politicized national security doctrines throughout Latin America. Moreover, by giving causal primacy to the Peronist movement’s role in producing democratic instability, McGuire tends to underestimate the fact that other powerful actors were arguably even less committed to democracy. The messianic political projects of the military were more ambitious than simply to repress labor and leftist mobilization. General Onganía’s West Point speech in 1964 was a harbinger of the military state to come, which institutionalized the Argentine military’s priorities of “security and development,” key pillars of national security doctrine. Important sectors of the military had their own motives for a “modernizing coup” and had little faith in liberal democracy. Thus, they abolished not only Peronism after the 1966 coup, as before, but all parties; they dismantled all constitutional institutions and channels of representation in the country. The behavior of the Argentine military was proactive, not merely reactive (even more so in 1976), and its political projects and ideologies are crucial independent variables in the explanation of democratic instability in Argentina.

On a related issue, I find the implication that strikes or protests provoke or set the stage for military coups a disturbing formulation. The Huntingtonian (or Schumpeterian) thesis that mass action and popular contestation undermine democratization has been challenged in much literature (recently Nancy Bermeo, “Myths of Moderation: Confrontation and Conflict during Democratic Transitions,” *Comparative Politics* 29 [April 1997]:305–22).

To make his argument about the centrality of parties to democratic stability, McGuire shows that big landowners and other elites in Chile had a stake in competitive politics via conservative parties that controlled peasant and worker votes until electoral reforms in the late 1950s allowed new social groups to gain a voice. Then, elites began to opt for antiparty politics, a period McGuire compares to Argentina’s 1912 electoral reform (p. 39). But there is a paradox here. If elites respect competitive politics only so long as they dominate the system and exclude other sectors, then in what sense can this be called democracy? Competition restricted to elites seems to fail McGuire’s definitional requirements, and furthermore, the problem of democratic instability then must be traced not to lack of party institutionalization but to elite unwillingness to accommodate the interests of new social groups. Indeed, the case of Chile in 1973 suggests that elites also may be alarmed by strong institutionalized parties of the Left or of workers (not only movements), prompting them to jettison the democratic framework.

The amorphous nature of the concepts of democratic quality and consolidation leave this reviewer unsatisfied. Taken-for-grantedness relies on attitudes, and we are not told *whose* attitudes are significant—those of elites? the military? everyone? Attitudes also are subject to change. Institutions might lose their value-infusion in the eyes of former supporters; democracy might be deconsolidated. Yet, the appearance of consolidation might exist simply because several elections have occurred, but elections may take place

in nondemocratic conditions (Indonesia, Nigeria, and Central America come to mind); stability is not the same as democracy.

Finally, much contemporary literature divorces the concept of democracy from ideas of social and economic equality long associated with democracy. But how much inequality can democracy tolerate? The author acknowledges the link between inequality and distributive conflict, which leads to instability, thus implicitly noting the interrelationships (e.g., p. 260). One wishes for more theoretical exploration of the linkages between democracy and equality.

These critiques should not detract from the importance of James McGuire's book, which makes a significant contribution to key debates in the discipline. The book is well researched and readable, and it is an important resource for scholars of Argentina, labor history, parties, and political regimes.

Democracy and Dictatorship in Ghana and Tanzania. By Robert Pinkney. New York: St. Martin's, 1997. 230p. \$59.95.

James R. Scarritt, *University of Colorado at Boulder*

Using a conceptual framework developed in his 1994 book, *Democracy in the Third World*, Pinkney compares Ghana and Tanzania with regard to their civil societies, prior regimes, democratic transition processes and outcomes, and potential for democratic consolidation. This framework focuses on types of democracy; the influence of political culture, civil society, economic success, and political ideologies and institutions on democratic prospects; the seeds of challenge to authoritarianism, the configuration of interests, and the resolution of conflicts as elements in the transition process; and the nature of that process as a key influence on the prospects for consolidation. Pinkney believes that it is interesting to compare these countries because both of them have an intermediate level of potential for successfully democratizing despite their widely different political histories; both their similarities and their differences help explain why they are at this level. An explanation based on such a broad and nonfalsifiable framework is less satisfying than one based on a tight theoretical model, but Pinkney uses his framework very effectively, given its inherent limitations. His extensive knowledge of the two countries, based on both first-hand experience and reading extensively in the relevant literature, allows him to do so.

Ghana is portrayed, accurately in my view, as having three ideological tendencies: state socialist, populist, and liberal. These have competed for power over a long history of civilian and military regimes supplanting one another by coups and returns to civilian rule. No system has worked well for a variety of reasons that Pinkney discusses, and Ghanaian society has been marked by several types of rather intense conflict stemming in large part from this ideological competition. The current Rawlings–National Democratic Congress regime, despite its conversions from a radical populist to a capitalist economic ideology and from a junta to a majority party in a competitive party system, remains within the populist tendency. It has weak roots in society, even in comparison to its opposition, which is an unstable combination of the other two ideological tendencies. Pinkney believes that the current party system, excessive presidential powers granted under the present constitution, and the antidemocratic, interventionist tendencies of the Ghanaian military are the clearest obstacles to democratic consolidation, but the potential effects of political culture, civil society, and most

other political institutions in this regard are ambiguous. He thinks that competition between parties representing the other two ideological tendencies led to instability under economic decline but could provide a better basis for consolidation under the current favorable economic conditions.

In contrast, again accurately in my view, Tanzania is portrayed as having been dominated by a single socialist ideological tendency since independence (although it has had different interpretations), and as having experienced a high level of stability under a single-party system that allowed limited but significant internal competition and tried to combine the procedures of what Pinkney calls liberal democracy with the policies of popular democracy. Compared to Ghana, political culture is more pliant and egalitarian, and there has been less conflict, although civil society is weaker. The ruling party, despite its recent decline, is still much better organized than the newly created and fragmented opposition, which has limited regional and class (new bourgeoisie and disaffected workers) support. Civilian supremacy over the military is strongly entrenched by African standards, which is good for consolidation, although the centralization of other political institutions is not. A reorientation of economic policies has also occurred under externally imposed structural adjustment, but this has not reversed economic decline as it has in Ghana.

Pinkney also points out important similarities between the two countries. Ruling parties or groups dominated both transitions despite their own internal problems because social movements supporting democracy were so weak. He suggests that these countries differed sharply in this regard from earlier "third-wave" democratizers. In *Democratic Experiments in Africa* (1997), Bratton and van de Walle show that Ghana and Tanzania also differed significantly from other African countries, many of which experienced considerably more protest. Partly because they had so little voice in the transition process, oppositions in both countries strongly disputed the fairness of the posttransition elections. Another crucial similarity that Pinkney finds between these two countries, and one that I believe is more widespread, is the absence of viable alternatives to democracy, imperfect though it may be. For almost all groups in the complex configurations of interest that Pinkney lays out for both countries, political life is sufficiently better after transition to prevent a significant amount of what Huntington, in *The Third Wave* (1991), calls authoritarian nostalgia. Thus, Pinkney believes that both countries could remain unconsolidated democracies for a long time.

The facts that Pinkney lays out, analyzed within his framework, support a tentative conclusion that Tanzania has better prospects for democratic consolidation than does Ghana. My conclusion is probably based on a different weighing of the factors that Pinkney discusses, although it is impossible to be certain, because he does not weigh them. Perhaps we differ on the significance of internal competition within the Tanzanian ruling party in comparison to the significance of Ghana's short periods of multiparty democracy. Or perhaps we disagree about the significance of the organizational strength of ruling parties. These differences, if they exist, can only be resolved by formulating and testing a precise theory of the relation between the nature and extent of past democratic experience and consolidation prospects. We may also disagree about the significance of economic success or about the probable duration of Ghana's economic success. But resolution of these possible difference would also require theory formulation and testing. Pinkney's book should be read by those who are interested in theory building—as well as by those who just want to learn more about the two countries—

because it provides important clues for the development of relevant theories.

Political Participation in Beijing. By Tianjian Shi. Cambridge, MA: Harvard University Press, 1997. 334p. \$49.95 cloth, \$22.95 paper.

Yang Zhong, *University of Tennessee, Knoxville*

Empirical and systematic study of mass political culture and behavior in communist countries has eluded social scientists for decades. Despite the tremendous constraints, students of the former Soviet Union and communist Eastern Europe were already attempting to gauge political culture and behavior of ordinary citizens in those countries in the late 1970s and the 1980s through survey techniques. Empirical study of mass political culture and behavior, especially through survey techniques, has been a weak spot in the Western scholarship on China as well. As Allan Liu recently noted in *Mass Politics in the People's Republic* (1996, p. 2): "Until recently, U.S. scholars specializing in China paid episodic attention to Chinese mass sentiments. The concept of public opinion did not appear in the lexicon of contemporary U.S. sinology until the 1980s." Indeed, much attention in the study of Chinese politics has been given to the Chinese elite and formal political institutions and processes. Thanks to the relaxation of political control in the People's Republic of China (PRC) since the 1980s, scholars in the West have shown noticeable interest in political attitude and behavior at the mass level. Even though using survey research methods is still a novel enterprise in China studies, the limited number of such endeavors have already yielded important information and empirical findings about patterns of political culture and behavior in the PRC.

Tianjian Shi's *Political Participation in Beijing*, which uses survey techniques in an extensive and intensive study of the forms and patterns of citizen political participation in Beijing, is a breakthrough in the field and points out a new direction in the investigation of Chinese politics. A central argument in the book is that the institutional setting, most noticeably the work unit system, in China shapes the forms and determines the nature of political participation. Specifically, work units in urban China are the center of citizens' life. The Chinese work unit is charged with political, economic, and social functions that range from serving as a political control tool to a government propaganda machine, from distributing apartments to providing education, and from solving marital problems to maintaining social order. This feature of institutional setting determines that most political participatory acts in the PRC occur in the work units, which is different from most other societies. Another unique aspect of political participation in the PRC, according to Shi, is that it focuses mainly on the policy implementation stage rather than the policymaking stage. Chinese work units are primarily policy implementation bodies. Since many of the policies are vaguely worded (often on purpose) and lack clarity, there is much leeway for work unit officials to interpret and change the policies.

Shi is obviously not the first to make these observations. The most valuable contribution of this book is that Shi, by using sophisticated and vigorous social science methods, empirically documents the forms and degrees of political participation in urban China and presents many interesting and intriguing findings. Specifically, he identifies 28 political participatory acts and groups them into various categories: voting, campaign activities, appeals, adversarial activities, cronyism, resistance, and boycotts. Shi found that in the late

1980s only one-tenth of the people in urban Beijing were totally apathetic and never engaged in any political activity to articulate their interests. In contrast to participatory behavior in liberal democracies, people in urban Beijing, due to structural constraints of the political system, rely primarily on appeals, adversarial activities, resistance, and cronyism to get what they want. Shi further found that, contrary to situations in other countries, engagement by urban Beijing residents in resistance and cronyism negatively correlate with efficacy and regime-based trust. This finding suggests that engagement in these activities in Beijing makes people feel alienated from rather than identify with the political community.

Another strength of the book is its comparative perspective. Not only did Shi use standard political science theories to study political participatory behavior in Beijing, but also he constantly compares China with findings from liberal democracies and the former Soviet Union to illustrate the differences and similarities. Still another strength of the book is its insights on participatory political acts by ordinary Beijing citizens. Shi grew up in China. He was a "sent-down" youth during the Cultural Revolution and later became a truck driver in Beijing. His life experiences in work units enable him to know such concepts or practices as *zuzhi dui zuzhi* (organization to organization) and *chuanxiaoxie* (giving one tight shoes to wear). Chinese scholars are often accused of seeing the trees not the forest, while Western scholars are often accused of the reverse. Shi can see both the trees and the forest.

As with any good book, there are places for improvement. I have a problem with Shi's definition of political participation: "activities by private citizens aimed at influencing the actual results of governmental policy" (p. 21). Many issues involved in political participation do not have much to do with governmental policies. Allocation of apartments, allowing children to succeed to their parents' jobs, and even awarding bonuses are policies made by work units. If the author considers the work unit a basic level of government, there are still many civil matters handled by work unit officials that are not related to official policies, such as marital disputes, family problems, and disputes between neighbors. There is no question that many acts of interest articulation at the work unit level involve these issues in China. I am not sure how the questions were phrased regarding political participation in the survey questionnaire. What scenarios were covered and what scenarios were excluded? (The author should have provided a complete questionnaire as an appendix in the book.) Shi apparently agonized over the issue of what constitutes political activities (pp. 89–91). The solution was not a perfect one, and I am sure there is no perfect solution.

Another issue is the case study of Beijing and the justification of generalizing the findings to the rest of China. Shi did not fully explain why he chose Beijing as the site of his study of political participation. My guess is that it was chosen for convenience. Still, the author should have discussed why the findings can and should be generalized to the rest of urban China, since Shi often refers to China instead of urban Beijing. (the rural counties in Beijing were not included in this study) in reporting, analyzing, and interpreting the findings. Some people believe that Beijing urban residents are more politically active than the rest of the population. Another issue that should be addressed is the implications of this study for rural China, where people are organized quite differently from urban China, especially after the early 1980s. After all, 70–80% of Chinese live in the countryside.

Shortcomings aside, I believe *Political Participation in*

Beijing is a major scholarly contribution and brings a breath of fresh air into the field of China studies.

Remembering Stalin's Victims: Popular Memory and the End of the USSR. By Kathleen E. Smith. Ithaca, NY: Cornell University Press, 1996. 219p. \$29.95.

Jeffrey W. Hahn, *Villanova University*

One of the most troubling questions for societies making a transition from authoritarian rule is how those in power will come to terms with acts of repression committed by the past regime. To ignore the question is impossible and risks the credibility and legitimacy of those who would liberalize the system; to seek to settle scores with those who committed the crimes threatens members of the old regime with whom one must negotiate a peaceful transfer of power. It may also raise unsettling questions about the extent of complicity in those crimes on the part of those who cooperated, even unwillingly, with the old regime. Kathleen Smith has produced a valuable study of how this issue has played a role in the transformation of the Soviet system. Drawing on research from the literature on transitions elsewhere, the author argues that the Russian experience in coming to grips with its Stalinist past is distinctive. Her argument is rooted in the contrast between authoritarian and totalitarian systems. Both may be equally repressive, but the former accommodates elements of civil society while the latter seeks to eradicate any pluralism; the Leninist party-state system claimed for itself a monopoly of truth. This distinction lies at the heart of the book's major thesis: What made Soviet leaders' efforts to come to grips with the past so difficult was reconciling their putative infallibility with the clear fact that serious mistakes had been made. To acknowledge the mistakes threatened the legitimacy of their claim to power and the privileges that went with it. The existence of elements of a civil society, such as the Catholic church or Solidarity in Poland, might have helped liberalization in the Soviet Union, but none were permitted.

Two chapters of the book reveal how liberalizing Soviet leaders attempted to deal with the dilemma of acknowledging Stalin's crimes while at the same time preserving the party's claim that it alone had the right to decide what was best for society. Smith shows how both Khrushchev and Gorbachev tried, in the end unsuccessfully, to circumscribe investigations into the past so as not to jeopardize the party's authority in the present. The best parts of the book are the chapters demonstrating how important the issue of anti-Stalinism was as a catalyst for the development of dissent under Khrushchev and Brezhnev and for the genesis of a civil society in Russia under Gorbachev. Smith traces how anti-Stalinist dissent was institutionalized in the period of perestroika and led to the creation of Memorial, the first truly independent social movement in Russia with wide popular appeal. Her description of how it came to be is fascinating and represents some of the best writing and research in this extremely well-written book. Equally important, if less uplifting, are the chapters that describe the problems, both internal and external, which Memorial faced and which contributed to the decline of anti-Stalinism as opposition forces moved from participation in social movements to participation in political parties. The book concludes with speculation on what the end of Soviet rule means for settling accounts with Russia's Stalinist past.

Remembering Stalin's Victims contributes both to our knowledge of transition politics and to our knowledge of Soviet and Russian politics. The author's excellent command of the literature on transitions enables her to link explicitly

and compare what she finds happening in Russia with issues of extrication and legitimacy in other transforming societies. She has something new and important to say about how civil society develops and why its absence in Leninist systems is an impediment to democratic development. Her research also offers insight into the dynamics of social movements and the factors that determine their success as political actors. Those interested in Russia's transitional politics will be informed by her discussion of Memorial and the difficulties it faced in its battle for official recognition. Gorbachev's role in this appears highly ambivalent. What makes Smith's narrative so compelling are her interviews with the leaders of Memorial and her access to the organization's internal documents during the six months of field research she conducted in 1991 and in shorter subsequent visits to Russia, Belarus, and Ukraine. Not only is the research solid, but also the author's analysis is presented in as scholarly a manner as one could reasonably expect when dealing with a subject as emotionally charged as remembering the history of Stalin's depredations. The text is enlivened by occasional photographs related to the anti-Stalinist movement in Russia.

This fine piece of scholarship is not without shortcomings. One is a certain lack of clarity in focus. On the one hand, the book is about how Russia has dealt with its Stalinist history. It is about destalinization and human rights. Here the focus is on how regimes in transition grapple with memories of injustice. On the other hand, it is about Memorial as a political organization, and here the focus is on the emergence of civil society in Russia and the impediments it faced. While these themes are obviously not unrelated, it was not always clear whether I was reading a history of the human rights movement in Russia or an analysis of the evolution of group politics during perestroika. Of the two foci, the stronger sections are those that deal with the latter theme. Those on the history of destalinization do not offer much that is new. There is also something of a time problem with this book. When the author does focus on Memorial, she covers well what happened in 1988–91, but the account of what happened to the organization after 1991 is weak, if nonexistent, despite visits by Smith to Russia in 1992, 1993, and 1994. Finally, there is a tendency to overstate the importance of the issue of anti-Stalinism in the political transformation of Russia. The issue needs to be seen in the context of the important institutional changes going on at the same time. Of these, none was more important than the introduction of competitive elections, which not only released the centrifugal forces of nationalism in the republican legislatures but also changed the nature of local Russian politics. To argue that the local party-state apparatus was a monolith "unified" in opposition to unofficial organizations ("informals") (see p. 118ff.) is possible in 1988 but not by 1990–91. By then the local party organization in many areas was disintegrating, creating a new climate for Memorial's activities, as evidence from Yaroslavl¹ (see p. 128) provided by the author herself suggests.

The Clash of Rights: Liberty, Equality, and Legitimacy in Pluralist Democracy. By Paul M. Sniderman, Joseph F. Fletcher, Peter H. Russell, and Phillip E. Tetlock. New Haven, CT: Yale University Press, 1996. 291p. \$35.00 cloth, \$18.00 paper.

Patrick Malcolmson, *St. Thomas University*

Perhaps it is less the case now than a few decades ago that a political science devoted to helping democracy is seen as degrading itself into a form of civic education. This book is an

excellent case in point. The authors clearly are as concerned about what the values of democracy ought to be as with describing what they presently are. They begin with the announcement that the book is "an essay in democratic theory, albeit in an empirical key." Democratic theory has long relied on, and continued to verify, the thesis "that political elites, by virtue of their involvement in politics, outstrip ordinary citizens in commitment to civil liberties and democratic rights" (p. 47). When push comes to shove over the right to free speech, for example, it is the elite who are more likely to stand on principle and defend the rights of those who would express offensive and repugnant opinions.

Sniderman and company challenge this thesis. The book demonstrates that "on a wide array of issues requiring political elites to balance competing considerations of individual rights and social order, their responses are indistinguishable from those of the public at large" (p. 24). When it comes to classic freedom of expression issues, the elite are more likely than the general public to hold their ground on democratic rights; but apart from these issues, the authors find that elite opinion and mass opinion converge. Their findings should cause most readers to sit up and take notice. So much for the old view that the elite are the guardians of liberal democracy.

According to the authors, a major shortcoming in previous research is that it failed to take into account the effects of the party system. It presupposed that the decisive contrast is between the elite and the mass public. Using the conceptual framework of Schumpeter to reexamine the work of McCloskey, Brill, and many others, the authors provide a new interpretation. The research in this book concludes that the electoral system operates to provide a choice between competing sets of elites. The deeper flaw was that, beginning with the "groundbreaking work" of V. O. Key, which in turn inspired so much of the scholarship on democratic elitism, the concept of the elite was "understood in curiously apolitical terms"—outside the institutional context of politics and independent of the party system (p. 242).

This argument is both interesting and valuable in illuminating the present condition of democracy in North America. But the argument so far described is only the starting point for the real thesis of the book: The reason consensus cannot be easily achieved by the elite or the mass public when it comes to issues of democratic rights is that rights are "inherently contestable."

The notion of democratic elitism was in fact based upon what the authors term the "error thesis." As they point out, most people support fundamental democratic rights in the abstract; but when it comes to a particular issue of free speech, they often desert their post. One can only conclude that this reflects "a failure to understand how an abstract right of which they approve applies to a specific issue" (p. 53). The connection between the error thesis and the thesis of democratic elitism is fairly obvious: The elite are less prone to such failures in comprehension.

The authors argue against the error thesis and in favor of the "inherent contestability" thesis. There is no one correct theory of rights, no right answer, so to speak. Hence, there can be no error. Rights are inherently contestable concepts. Democracy must, therefore, find its foundation on a theory of "value pluralism" or democratic relativism.

Using sophisticated polling techniques that attempt to measure how "pliable" people are in holding their opinions, the authors survey public opinion on issues involving racism and hate speech, censorship, pornography, feminism, an array of equality rights, aboriginal rights, and

issues of identity politics. The public is, for the most part, the Canadian public, and the issues are identifiably Canadian.

Because this is a work of empirical theory, it should go without saying that the philosophical foundation of the argument—the inherent contestability thesis—can only be supported by but not deduced from the empirical evidence the authors provide. This evidence is presented in a clear and straightforward manner in the form of bar charts, and it is indeed illuminating. If the error thesis is correct, then it suggests that the elite are now as prone to error as the general public; if the inherent contestability thesis is correct, then it suggests that the distinction between the elite and public cannot be based on the profundity of their understanding of rights issues.

This book raises a number of deeply troubling questions for those who study and care about contemporary democracy. It challenges the received scholarship, puts forward a new interpretation of rights politics, and suggests how political institutions might be designed to take democratic reality into better account. Regardless of the focus on Canada, the readers of this journal will, upon examination, find this to be a challenging but rewarding new work of scholarship in empirical democratic theory.

Post-Communist Presidents. Edited by Ray Taras. Cambridge: Cambridge University Press, 1997. 250p. \$54.95 cloth, \$18.95 paper.

Timothy Frye, *The Ohio State University*

Ray Taras and his coauthors have produced a useful work that captures the intricacy of creating presidential power in the early years of the postcommunist transformation. Using studies of the definition and exercise of presidential power in Russia, Ukraine, Kazakhstan, Hungary, Poland, and the Czech Republic, the cases provide rich empirical accounts that remind us of the great contingency of institutional choice during the early years of the postcommunist transformation.

Juan Linz and Jon Elster provide relatively brief introductory and concluding chapters that echo arguments for which they are well known. In the introduction, Linz draws evidence from the postcommunist cases to reinforce his belief in the perils of presidentialism. His defense here is more qualified than in past works but remains strong. In the conclusion, Elster argues that bargaining among self-interested politicians, rather than considered debates about the merits of different institutional arrangements, has driven the process. He concludes that for the institutional designers of the postcommunist world, reason has been crowded out by interest and passion.

Ray Taras introduces the cases studies with a review of debates on presidentialism/parliamentarism, then detours to useful discussion of the historical roots of the concept of separation of powers. Drawing on historical perspectives from Bagehot to Laski, Taras reminds us that debates over the effects of institutions have a long tradition in the field. He also provides a thoughtful parsing of the concept of separation of powers into four different usages: the rule of law, accountability, balancing, and efficiency. Taras's brief treatment of separation of powers provides a clear statement of a complex concept.

Taras notes that the chapters are a means to examine two issues: the exercise of presidential power and the effect of different arrangements of presidential power on the consolidation of democracy. By this measure, the volume falls short of the mark. The notoriously slippery concepts of presidential

power and democratic consolidation are often discussed but not analyzed systematically. The chapters are largely descriptive and make little attempt to generate or test theoretical propositions, particularly across cases. Rather than build or test theories, the authors use theoretical insights from the institutional literature to inform their cases studies. By this measure, the volume fares much better.

The case studies stand on their own as useful works. They are well researched and thorough. The authors resist the tendency to ascribe all political events within a country to its particular institutional arrangement and recognize the difficulty of separating the powers of the office from the powers of the individual officeholder.

The most notable chapters try to place the case study within the broader framework of presidential power in the region. Andrew Wilson provides a sound treatment of struggles for power between the Ukrainian parliament and successive presidents, Leonid Kravchuk and Leonid Kuchma. In Wilson's view, legislative gridlock was not determined solely by institutions but also by the personalities of the two Leonids. Kravchuk had little taste for conflict, while Kuchma relished doing battle with the parliament. Wilson deftly traces how Kuchma expanded the powers of the Ukrainian presidency but fell short of creating a Yeltsinesque super-presidential regime. These points give the chapter a helpful comparative perspective.

Krzysztof Jasiewicz's chapter on the Polish presidency is also quite well done. He argues that Walesa, by pushing to expand his powers so aggressively, helped consolidate parties within the fractured Polish parliament to oppose the creation of a strong president. Jasiewicz also provides a valuable comparison of changes in presidential powers over time.

Patrick O'Neill's discussion of the complex negotiations that created the Hungarian presidency shows considerable skill, and Sharon Wolchik's treatment of the Czech Republic's "philosopher-president" Vaclav Havel is equally deft. These cases provide a nice contrast on how weak presidents can sometimes expand their formal powers. O'Neill describes how Arpad Goncz used vagaries in the formal rules of the Hungarian presidency to expand his formal powers, while Wolchik depicts how Havel failed to translate his moral authority into stronger formal powers, despite expending much effort toward this goal.

Writing on the presidency in Russia, Stephen White is doubly challenged. The case is well known. In addition, the chapter ends just after the 1996 presidential election, giving the author little time for reflection on this event. As if to offset these disadvantages, White devotes more attention to lesser-known aspects of the Gorbachev presidency than to central issues in the Yeltsin presidency, such as the dissolution of parliament in October 1993. This makes for a somewhat unbalanced chapter. In contrast, Martha Brill Olcott's work on the Nazarbaev presidency in Kazakhstan is somewhat more balanced and devotes more attention to central political issues, such as the dissolution of the Kazak parliament in 1994.

The chapters work better as individual pieces than as a whole. This is unfortunate, given the tremendous opportunity for comparative work on presidential power in the postcommunist world. As a volume, the work suffers from two shortcomings. First, the chapters present little data that is comparable across cases. The authors use a variety of measures for presidential power, including indices by Shugart and Carey and by James McGregor as well as idiosyncratic judgments by the authors. This makes it difficult to judge the relative strengths of the presidents across cases. Measuring the formal or informal powers of the presidency is admittedly

difficult, but such measures are needed to generate a deeper understanding of the cases.

Second, the empirically rich case studies capture much of the context in which decisions were made and emphasize the unique aspects of each case, but that makes comparison across cases difficult. By taking a holistic approach to the development of presidential powers, the authors are forced to give less treatment to important questions that could have been better served by a more narrow focus. For example, more explicit comparisons could have been made of the causes of the dissolution of the Russian and Kazak parliaments and the nondissolution of the Ukrainian parliament. Or attention could have been devoted to variation in formal and informal powers across cases. By focusing on a specific aspect of presidential power—such as decree making, government formation, the choice of presidential versus parliamentary systems, or the role of constitutional courts—the authors could have made a larger theoretical contribution.

The case studies tell us much about particular presidencies and create a solid foundation for future research. The task for scholars working on postcommunist political institutions now is to move beyond rich political histories to directed studies that test and build theory. As scholars seek to create more general theories about institutional choice, electoral rules, and presidential power across the postcommunist cases, the chapters in this volume remind us of the great contingency of institutional developments in the early years of the postcommunist transformation. Taras and his coauthors have provided a valuable service by tracing how small details and nuances shaped the process of institutional choice in idiosyncratic ways that will be difficult to build into theories. Perhaps the main lesson from the case studies themselves is that building powerful and parsimonious theories about presidential power in the postcommunist world will be a difficult task.

Demanding Democracy: Reform and Reaction in Costa Rica and Guatemala, 1870s–1950s. Deborah J. Yashar. Stanford, CA: Stanford University Press, 1997. 319p. \$49.50 cloth, \$17.95 paper.

Mitchell A. Seligson, *University of Pittsburgh*

Deborah Yashar's richly detailed and nuanced case studies of Guatemala and Costa Rica should give pause to those who have been disparaging the utility of area studies research in political science. Yashar asks two major theoretical questions: What are the conditions under which democracies are founded? What are the conditions under which democracies can be sustained? Many democracies have been initiated, but relatively few have survived over long periods. In Latin America, only Costa Rica has avoided breakdown, while once promising cases, such as Chile and Uruguay, each succumbed to authoritarian assaults. It is with good reason, therefore, that Yashar selects Costa Rica for detailed analysis. The resilience of its democracy, in a region characterized by instability, revolution, coups, and brutally authoritarian regimes, has puzzled social scientists for many years. Guatemala serves as the counterpoint, a country in which only very recently has there been a continuous series of democratic elections, but in which civilian supremacy over the military and the prospects of executive coups are issues that are far from being resolved.

While making no claim to universality (p. 2), the author presents a theory which attempts to go beyond approaches that focus exclusively either on the role of key actors in the founding of democracy or on structural conditions that

determine the ability of democracy to survive. The core of the theory rests on the conditions which help build coalitions that will both found and maintain democracies. While agreeing that the role of markets and states matters, Yashar believes they are not determinant. Therefore, approaches that rely primarily on underlying structural conditions are subsumed by Yashar under the rubric of coalitions. Following Dahl, she argues that when economic and political resources are highly concentrated, it is more difficult to build a democratizing coalition. To found and sustain democracy, it is necessary to break the stranglehold of old elites on resources and create new transclass alliances that incorporate at least components of the masses. In developing countries, rural allies need to be sought, since much of the population and production remain in those areas. The key for a democratic breakthrough is a division within the elite coupled with an organized civil society making demands for citizenship rights. Those breakthroughs occur at "critical junctures," a thesis that draws upon the concept developed by Ruth Berins Collier and David Collier. When there are no divisions within the elite, but the popular sectors demand democracy, the result is either the marginalization or repression of the masses. If the elites are divided, but there is no popular pressure, all that one can expect is for one form of authoritarian rule to be replaced by another. For democracy to emerge and be sustained, argues Yashar, both elite division and civil society pressure must be combined simultaneously.

This is certainly an interesting thesis, one that moves us away from glorifying the heroes who found democracy, or from assuming a tight nexus between certain economic forms and democratic emergence. It also minimizes the importance of foreign intervention, a factor that has often been seen as central in Latin America, and fundamental in the case of Guatemala in particular. The thesis is supported in the book by a very detailed look at the two countries, covering the 1870s through the early 1950s. The theoretical unity of the work is greatly enhanced by the treatment within each chapter of both cases, so that the reader can easily draw comparisons. This is certainly an important advance over comparative politics studies that devote separate chapters to each country, leaving it up to the reader to make the connections.

The two case studies are presented within the framework of a most similar systems design, and it is here that some readers may quibble with the conclusions. Early in the book (Figure 1, p. 8), the author depicts the parallels in the political histories of the two countries, showing that they both went through a long undemocratic period, which was radically altered in the 1940s, but that only in Costa Rica did that period of democratization last. In Guatemala, in contrast, "military authoritarianism" replaced democracy as a result of the coup of 1954. Yashar makes the claim that, before the 1950s, "Costa Rica and Guatemala experienced variations within broadly parallel regime trajectories of authoritarianism and democracy through the middle of the twentieth century" (p. 7). She presents data to show that up until the early 1950s, when the two countries began to follow sharply different trajectories, they were similar both politically and economically (pp. 5-7).

Many scholars of Central America would argue that those parallels are overdrawn. They would take sharpest issue with Yashar's statement that "Guatemala founded authoritarian

rule in 1954," whereas "historical and conjunctural factors interacted to found political democracy in Costa Rica in 1948" (p. 211). Brutal authoritarian rule has prevailed for almost all of Guatemala's history since independence, whereas incipient democratic traditions can be found in Costa Rica for at least the last 100 years. Therefore, to argue that authoritarian and democratic rule were *founded* in the 1948-1954 period in these two countries is not consistent with the facts as presented in the book itself.

One of the most important differences between the two countries, which Yashar details in her book, is the presence of a large, subordinate Indian population subject to repressive labor conditions in Guatemala, but there is no such sizeable population in Costa Rica. There the indigenous population was small from the outset and largely disappeared in the early years of Spanish colonization. The historical shortage of labor, coupled with ethnic homogeneity, seems to have rendered impossible the widespread emergence of a serf-like labor force in Costa Rica. Perhaps out of these important differences emerged many others, including a stronger civil society. One factor contributing to that strength was the establishment of universal primary education in Costa Rica in the 1880s. By the late 1940s, nearly four-fifths of the population was literate, compared to about one-quarter in Guatemala. Indeed, Guatemalan literacy rates in the early 1990s were about the same as Costa Rican rates in 1915.

While it is true that before the 1950s political rule was oligarchical in Costa Rica, Yashar does not sufficiently stress the strong civic traditions and respect for human rights that were (and largely still are) absent in Guatemala. Yashar also minimizes the importance of the role of external factors; the United States, for example, played a pivotal role in the coup that extinguished Guatemalan democracy in 1954, whereas it played a small but positive role in trying to bring about a negotiated conclusion to the Costa Rican Civil War of 1948.

Yashar correctly emphasizes that the survival of democracy depends on state penetration of the countryside and the state's ability to "subvert traditional elites" (p. 231). Yet, traditional rural elites in Costa Rica were very different from those in Guatemala, as is shown on pages 30-5; the yawning ethnic gap that separated large landowners from their debt-peons in Guatemala was virtually nowhere to be found in Costa Rica. Thus, in order for democratization to take hold, there was much less need to break the backs of the rural elite in Costa Rica than in Guatemala, where a massive land reform implemented in the early 1950s proved central to engendering the conflict that eventually culminated in the 1954 coup.

This is a well-written and carefully researched book. It rests its scholarship on a wealth of secondary and archival sources, coupled with transcriptions of the author's illuminating interviews with key political figures who participated in many of the events described. The theoretical advance of an explicit link between the conditions fostering democracy's founding with those accounting for its endurance will help us better project the prospects for survival of the dozens of democracies that have emerged in recent years. Students of those cases would do well to pay close attention to Yashar's theory.

International Relations

Post-Realism: The Rhetorical Turn in International Relations. Edited by Francis A. Beer and Robert Hariman. East Lansing: Michigan State University Press, 1996. 429p. \$35.95 cloth, \$24.95 paper.

Ronald J. Deibert, *University of Toronto*

It is now commonplace to note that we live in a world of increasingly intense media encounters, where the line between the "image" and the "reality" are all but dissolved. Perhaps nowhere is this phenomenon more intense than in those focused moments of high global hostility, such as that which has characterized recent events in the Persian Gulf. Here, the familiar talking heads offer strategic mediations on CNN that draw upon a rich and diverse well of realist maxims, rhetorical devices, and allegories. Percolating through generations of academics and foreign policy practitioners acculturated into the *weltanschauung* of realpolitik, these maxims, devices, and allegories at once precede and shape the "reality" to be apprehended "objectively." We can pretend that the two are distinct—the world "out there" and the academic study of it, that is—but of course they are not. In the hypermedia environment, more than ever before, theories of world politics are inextricably intertwined with and help reproduce the world they set out to represent.

The chapters collected in *Post-Realism* take aim at understanding more fully the processes by which this interaction takes place. Specifically, the volume is oriented around the rhetorical power and persuasive appeal of realism, the most dominant theoretical approach in the international relations field over the last century. Collectively, the authors explore realism not so much as a positive theory on its own terms but as a form of "persuasive discourse"—a powerful set of stories about how the world should and does operate, who are its main actors, and what are the main lessons of history. As many of the chapters note, the role of rhetoric and metaphor has been underappreciated in international relations theory for a variety of mostly epistemological reasons. The authors seek to rectify this oversight by focusing systematically on such issues, thus falling alongside other recent submissions into what has been called "the linguistic" or "rhetorical turn" in the social sciences.

This is a tightly edited and cogently organized volume with a high level of writing throughout. The editors, Francis Beer and Robert Hariman, begin with a clear introductory piece that nicely sets the backdrop and capsulates many of the precise ways a "post-realist" approach differs from a traditional realist one. The chapters split into three major sections. The first, "Rereading Realist Writers," includes essays by Hariman, Ivie, Aune, Jones, Epp, and Goodnight on the writings of Kissinger, Kennan, Niebuhr, Carr, Wight, and Morgenthau, respectively. All are very strong chapters that provide detailed and insightful analyses blending the personal and political convictions, historical contexts, and intended audiences of the authors concerned. Roger Epp's thorough excavation of Martin Wight is particularly nuanced and refreshing, and it goes far beyond the standard aphorism for which Wight is most known, that there can be no "international theory," to reveal a complex and multifaceted character struggling with numerous and overlapping debates and doctrines.

The second section, "Rewriting Realist Concepts," includes chapters, most of which are intellectually provocative and cast in broad theoretical and historical terms, that critique and reformulate realist concepts and categories. Jean Elshtain provides rich relief on the grip and almost irresist-

ible attraction of the notion of sovereignty while at the same time pointing to other possible formulations beyond its horizons. Paul Chilton's essay, "The Meaning of Security," catalogs the powerful set of symbols activated by this normatively loaded and centrally important realist term. Drawing on the metaphorical analyses of George Lakoff and others, Jennifer Milliken shows how the metaphors surrounding "prestige" and "reputation" have long animated U.S. foreign policy with clear political consequences. In "Nationalism and Realist Discourses," Yosef Lapid investigates the "neglect-of-nationalism-problem" in neorealism, tracing it to its positivist-scientific proclivities and, to a somewhat lesser extent, to those of earlier realist formulations as well. V. Spike Peterson hammers into pieces the hard masculine core of realism that was sculpted out of the gender-biased legacies of Western rationality and then begins to weave the fabric for a "feminist post-realism" patterned on a more holistic design. Easily the most flamboyant and provocative of the chapters is James Der Derian's reinterpretation of realism, which begins with a forty-plus listing of the many different senses in which "realism" surfaces, from magical and minimalist to super- and hyper-. Why? Because far too often realists in international relations theory present only one "flavor": a "uniform, self-evident, and transparent . . . vanilla" (p. 277). This is an essay that does not talk about metaphors and rhetoric—it employs them with devastating finesse and wit to unsettle established ways of seeing the world.

The final major section, "Rewriting Foreign Policy," includes chapters by Sylvan and Majeski, Doty, Wilmer, and Beer and Boynton that put forth several examples of what would constitute a "post-realist" research program in the area of foreign policy. Although each obviously differs in range and nuance, these chapters present convincing evidence that a postrealist approach, with its emphasis on metaphor and rhetoric, can produce interesting, insightful, and useful knowledge for those interested in foreign policy and world politics.

All "posts"—by definition—seek to move beyond *something*, even while retaining elements of that which they leave behind. Although certainly diverse, the chapters nonetheless share enough unity that it is fair to ask what elements of the old realism does this new version leave behind or move beyond? Perhaps twice removed from these rhetorical analyses are any notions of natural or material factors, whether of the "human," "technological," or "environmental" kind. Certainly, the *animus dominandi* of Morgenthau and the "Fallen Man" of Niebuhr are analyzed for their rhetorical or discursive weight, but they are blended out of the postrealist approach itself. Of course, human nature (indeed, all forms of nature) is out of style in these antiessentialist times and has been abandoned by realists since the structural formulations of Waltz. But one wonders whether some vitally important factors are being obscured and marginalized by a pure focus on words, language, discourse, and rhetoric. The natural impulses, desires, and fears that connect us to our "animal" side, the cognitive traits and adaptations that have evolved over millennia, the material instruments of technology, the "forces" of production and destruction, the influence of such environmental contingencies as climate, geography, resources, and disease, are all sopped up and absorbed by postrealist constructivism. (One exception is Peterson's "feminist post-realism," which makes reference to the biologically based importance of "nurturance.") Perhaps this is a component of at least some varieties of classical realism (not to mention Marxist and other historical materialist approaches) that would be better off revised and reformulated, rather than left behind?

What else do postrealists move beyond? One element for which neorealists certainly strive is a clear basis upon which to adjudicate competing theories. However spurious their positivism may appear to many, at least explicit criteria are formulated and adopted. Yet, with their acknowledgement of the constitutive role of language, postrealists must, by definition, move beyond representationalist epistemologies of this sort. What is less clear, however, is what they propose to take its place. On what basis, for example, are we to judge whether Charles Jones's fine interpretation of E.H. Carr is better than a possible competing one? In the introductory chapter, the editors allude to some other works that address these issues and hint at a possible accommodation with positivism, but the analysis stops short of saying precisely how this accommodation would manifest itself (pp. 10–3). In the conclusion, there are some criteria set forth by which a practitioner might formulate critical foreign policy, but these are directed at evaluating possible courses of state action and not alternative explanations. And in useful passages written by the editors as introductions to each major section there are hints of a pragmatic approach that would see interpretations judged on the ethical and normative consequences that follow from their being adopted. But a sustained and direct confrontation with the issue of adjudication between competing postrealist interpretations would have strengthened the volume and addressed a critical issue at the heart of the “linguistic turn.”

Nonetheless, this is a fine edited volume that makes a serious contribution to recent scholarship in foreign policy, rhetoric studies, and international relations theory. The chapters are well integrated, intelligently written, and provocative. Moreover, the book addresses a topic that will only become more important as we enter deeper into a world of swirling images and digitally mediated realities—the persuasive power of rhetoric, metaphor, symbols, and signs.

Friends in Need: Burden Sharing in the Gulf War. Edited by Andrew Bennett, Joseph Lepgold, and Danny Unger. New York: St. Martin's, 1997. 362p. \$55.00.

Gerald Steinberg, *BESA Center, Bar Ilan University*

In 1991, the Bush administration went to war against Saddam Hussein, claiming to be leading a broad coalition. In early 1998, however, when President Clinton prepared another attack following continued Iraqi interference with the U.N. arms inspectors, there was no pretense of a coalition. What was the nature of the initial alliance against Iraq, and what happened between 1991 and 1998?

The authors of *Friends in Need* examine the 1991 coalition from the perspective of alliance theory and burden sharing. After the editors establish a systematic framework in the opening chapter, the contributors of the individual cases use this framework to analyze the behavior of some of the countries in the coalition. The model, which extends the burden-sharing literature from the context of NATO during the Cold War, consists of five externally and internally derived hypotheses. The issue of collective action and the problem of free riders, dependence on the alliance leader, and domestic politics emerge as the central factors.

If Iraq was a threat to all members of the coalition (militarily in the region, and in terms of oil market stability for the other states), and if the United States was prepared to shoulder most of the military and economic burden to protect its own interests, then what motive did the other threatened states have to contribute to the confrontation with Iraq? For most of the states, the answers are not surprising, and the use

of the heavy weapons of social science are too powerful for the issues at hand. Yet, the effort and systematic case studies are important contributions to alliance literature. After emerging as the victor in the Cold War, the United States was (and is) the only potential leader of the posse, and the elaborate research design used to explain U.S. leadership is unnecessary. More interestingly, since the United States had the military power to act independently, and “most of the coalition partners were more trouble than they were worth in terms of actual military effectiveness” (p. 45), why did the Bush administration twist the arms of so many supporting actors?

In part, American domestic politics played a role. To gain support from the Democratic majority in Congress, which was hesitant to take risks to restore Kuwait's decadent monarchy, Bush thought he needed the facade of a broad international coalition. Once approached, many leaders feared that by refusing the American request, they would lose points in other areas. Korea and Japan depend on U.S. forces for stability in Asia, Germany needed diplomatic support for reunification, and the crumbling Soviet Union (although a reluctant ally whose envoys still sought to play an independent role) sought American aid to prevent the descent into anarchy.

In addition, American officials perceived U.S. allies “to be ‘free riding’ to some extent in NATO, and they were determined not to let this happen in the Gulf” (p. 60). The chapters on Great Britain and France demonstrate the degree to which the NATO pattern extended to this case. Under Thatcher, the British played the role of the experienced sibling, urging a strong stand in the battle of good versus evil and providing the largest deployment of British forces since 1945. According to Andrew Cooper and Kim Nossal, the “middle powers” (Australia, Canada, and the Nordic countries) joined in the idealist expectation that the coalition was “a harbinger of a new world order, in which the . . . UN would play an increasingly important role, and the U.S. would pursue a policy of multilateralism” (p. 271). They stayed even when realpolitik returned to center stage, because “the costs of leaving the coalition, both domestic and external, were too high” (p. 272).

Mitterand's France was the reluctant ally, attempting to carve out an independent role far beyond its significance and often at the expense of the collective good. Isabelle Grunberg's case study shows how French participation was “marked by a pattern of hesitations, delays, contradictory statements, ambiguous diplomatic moves, and uncertain military alignments” (p. 113). The Arabist French elite preferred to maintain its ties with Iraq, but a combination of public disdain for Saddam's brutality and the perceived need for strengthened ties with the United States to offset the effect of German unification led to limited cooperation.

The biggest problems for the United States were posed by the Arab states that Washington claimed to be protecting from Iraq. In the period after the invasion of Kuwait and before the war began, Bush voiced the fear that the Saudis are “going to be the ones who are going to bug out at the last minute and accept a puppet regime in Kuwait” (p. 46). Yet, once the Americans demonstrated their commitment to attack Iraq, and Saddam Hussein was likely to be ousted, Saudi commitment increased.

Egypt was also a central Arab participant, but as Daniel Brumberg shows, Cairo's policies were based on regional goals, not on a shared threat perception. Egypt's aspirations “required that it join the coalition rather than cede its role to the West—or to other Arab states” (p. 92). The 35,000 Egyptian troops dispatched to Saudi Arabia were not wel-

came in Riyadh, reflecting the fear that instead of Iraqi dominance, the Gulf would end up subjugated by Egypt. As soon as the war ended, the Saudis rejected the Egyptian offer of longer term "protection," and the troops were expelled. (For its trouble, Egypt obtained an economic package worth \$25 billion, largely in terms of debt forgiveness.)

With Egypt involved, other Arab states, such as Syria, followed in order to gain substantial aid, avoid the wrath of the United States, and also check Egypt's power. For the United States, the deployment of Syrian forces, however symbolic, blocked any plans that Saddam might have had to create an Arab alliance on his side. As Haleh Vaziri demonstrates, Iran's behavior as a "free rider" was determined not only by national interest but also by the absence of any viable option.

The greatest weakness in this volume is the absence of case studies of two of the most important actors in the events—Saudi Arabia and Israel. Saudi Arabia is considered in some detail in the chapters on the United States and the Arab states, and primary sources on decision making in Riyadh are difficult to obtain, but no such limits exist with respect to Israel. In addition to providing a "silent partner" and backstop for the combat troops and intelligence activities, Israel's major contribution came when the Shamir government stayed out of the war, despite the Iraqi attacks, and in the face of intense pressure and decades of policy based on preemption and retaliation. Israel was not a free rider and made a major contribution to the coherence of the coalition. The decision against responding was largely the result of Israel's unique alliance relationship with the United States and the expectation of improved security as a result of the destruction of Saddam's arsenal. The inclusion of this case would have added an important dimension to the study.

The authors of this study recognize, long before the latest round in 1998, that the situation in 1991 was an exception, not the beginning of a "new world order." "Because the forces that shaped the Gulf coalition were unique, it is unlikely that the US will have the means to create such a coalition in the future. Instead, it might be obliged to act unilaterally" (p. 109). As this study demonstrates, however, in a unipolar world, once the United States has decided to use its power, even the most reluctant states recognize the high costs of opposition.

Allies Divided: Transatlantic Policies for the Greater Middle East. Edited by Robert D. Blackwill and Michael Sturmer. Cambridge, MA: MIT Press, 1997. 327p. \$22.50.

Sara Roy, *Harvard University*

The greater Middle East, an area stretching from the Maghreb to the Caspian Basin, is a flashpoint of world politics and likely to remain so well into the future. For the 15 contributors to this highly informative and extremely well-done work, this increasingly precarious region remains vital to Western interests for three predominant reasons: oil, the proliferation of weapons of mass destruction, and rising Islamic extremism. Yet, shared interests in the Middle East region, more often than not, have failed to produce shared policy approaches, with potentially damaging geopolitical consequences for the nations of the transatlantic alliance.

This failure to agree (i.e., for Western European nations and the European Union [EU] to accept U.S. leadership) became most pronounced with the end of the Cold War and the demise of the Soviet threat, which not only diffused transatlantic solidarity but also challenged the need for

unquestioned U.S. political and economic dominance in the greater Middle East and elsewhere. Hence, U.S.-European commercial rivalries in the region, easily managed under the exigencies of the Cold War, have become increasingly difficult to contain. Similarly, the competition over arms sales, needed to support domestic arms industries that were thrown into crisis with the end of the Cold War, grows ferocious. These transatlantic rivalries, coupled with Europe's own effort to develop a distinct identity based on a common foreign and security policy, have further enhanced emerging divisions across the Atlantic.

Allies Divided contains essays by American and European analysts on issues central to regional stability and Western security in the greater Middle East: Israel and the Middle East peace process, the Persian Gulf (with particular attention on Iran and Iraq), Turkey and the Caspian Basin, weapons of mass destruction, and military force projection. The juxtaposition of U.S. and European views on each of these issues reveals a striking discord in policy and strategy among the allies that could, in the collective view of the contributors, damage Western interests in the region as well as the transatlantic partnership itself. Through a systematic and detailed examination of these differences and the reasons for them, which are accompanied by specific policy prescriptions, the volume manages to distill coherently a considerable amount of information and makes a convincing argument for greater cooperation among the Western alliance.

Disagreements between the United States and the European allies are wide and deep and span the entire region as defined. America's commitment to Israel, for example, which is far greater than that of Europe, has shaped the Middle East peace process in ways not always acceptable to the nations of Western Europe and the EU, who feel they have far more at stake given their geographical proximity to the region, heavier energy dependence, stronger commercial ties, and contrasting political views. Moreover, the consistent American refusal to allow the Europeans, particularly France and Great Britain, other than a complementary role in the peace process despite the fact that the EU has been a major financier of that process, has further strained relations. Indeed, the March 1998 visit by British Foreign Secretary Robin Cook to Har Homa, the highly controversial Israeli settlement, rankled not only the Israeli government but also the U.S. government.

Two other critical areas of discord, Iran and Iraq, will also pose major challenges to future U.S.-European cooperation. America's policy of dual containment as applied to these countries has found little if any support among the majority of European nations (with notable exceptions, such as Great Britain), who reject the use of coercion as a method of modifying state behavior. Yet, Europe's own attempt at critical dialogue, a form of engagement that is political as well as mercantile in character, has similarly enjoyed little success. Moreover, the Iran and Libya Sanctions Act, congressional legislation that would penalize European businesses trading with Iran, will do little to heal growing U.S.-European fractures.

Despite its clear merits, the volume may prove irksome to many scholars and analysts. Some key assumptions expressed in the chapters remain unquestioned and are presented as absolute truths when in fact many have been challenged or should be. For example, the Arab-Israeli mid-east peace process, as constructed, is seen as a positive formula for peace despite mounting and compelling evidence to the contrary, evidence (which even the U.S. government has been forced to concede publicly) that remains largely unaddressed and that would certainly affect any policy prescriptions for the region.

The volume also maintains that one goal, albeit unstated, of

U.S. policy toward Iraq is the removal of Saddam Hussein from power, when in fact U.S. policy may be committed to just the opposite. Why, then, during the Gulf War did the United States allow Saddam Hussein to crush the Shi'ite rebellion in the south (with the United States refusing to allow any military equipment to reach the regions of southern Iraq) and the Kurdish uprising in the north? If, in fact, U.S. policy is committed to Saddam's presence (in lieu of an "acceptable" alternative) and not his removal, how would this affect transatlantic strategies for the region as well as the region itself?

Another central assumption is the need for far greater convergence in U.S. and European approaches to the region. Yet, why dispense (entirely?) with what, arguably, amounts to a system of (transnational) checks and balances that helps curb the hegemonic nature of U.S. policy in the region in particular? Finally, while the purpose of the volume is to address Western interests in the Middle East and the role of the Western alliance in ensuring those interests, it does so by assuming that the region is the hegemonic domain of the West and that the countries of the region are to be engaged as unequals and often recalcitrant unequals. Although U.S. and European policies are presented as part of the solution for the greater Middle East, they are also part of the problem, having played a very real role in enhancing rather than mitigating extant instability and disorder. At issue is how to address this reality, the solutions to which would contribute mightily to regional stability and Western security as well.

Emergent Actors in World Politics: How States and Nations Develop and Dissolve. By Lars-Erik Cederman. Princeton, NJ: Princeton University Press, 1997. 258p. \$55.00 cloth, \$19.95 paper.

Miriam Fendius Elman, *Arizona State University*

Although the title may suggest that this is an undergraduate textbook on international relations (IR), Cederman's book is not for the novice. Writing for those already well versed in contemporary IR debates, Cederman provides a sophisticated treatment of nationalism (chaps. 6–8) and the balance of power (chaps. 4–5), and he contributes to a growing IR literature on the origins of the state (e.g., Hendrik Spruyt, *The Sovereign State and Its Competitors: An Analysis of Systems Change*, 1994). Like many of these new studies, Cederman considers states and nations as separate dependent variables, and he criticizes traditional realist and liberal perspectives for treating these actors as "exogenously given" (pp. 4, 214). Also consistent with the literature, Cederman grapples with the extent to which rational choice, and materialist explanations can account for institutional outcomes at both the domestic and international levels of analysis. But in terms of method, Cederman departs substantially from other IR studies on the state. *Emergent Actors in World Politics* presents a series of models based on computerized simulations to address the "fundamental question of why states and nations form and disintegrate" (p. 3). This complex adaptive systems (CAS) approach lends a dynamic perspective to the study of nationalist coordination and mobilization in multi-ethnic states and to balance-of-power theory. In an original twist that distinguishes the book from most current formal applications in IR (pp. 32–6, 48–9), Cederman's models are designed to incorporate features more often considered the bailiwick of qualitative analysis: path dependence, nonlinear and positive-feedback processes, multiple equilibria, historical accidents and inefficiencies, and group identity formation. The models yield a number of counterintuitive results, most important the finding that balance-of-power systems are

more stable when offensive technology has the advantage and defensive alliances are jettisoned (pp. 96, 99–100, 105, 109, 112, 215).

The point of departure is the neorealist research program, which Cederman criticizes for ignoring the origins, development, and disappearance of states and nations. To be sure, neorealists usually presuppose the existence of actors and prefer to concentrate on the explanation of international cooperation and conflict (p. 20), but Cederman goes too far when he claims that neorealism lacks a theory of the state (pp. 16–17, 23, 74). For instance, according to Kenneth Waltz (*Theory of International Politics*, 1979, pp. 127–8) the structure of the international system is the generative element that accounts for domestic political development. Domestic organizational features tend to converge because states coact in an anarchical environment. Those states that do not match domestic developments in others will become vulnerable and fall behind. Thus, Waltz expects growing homogenization and uniformity among states. His rudimentary theory of the state can be pitted against an alternative that predicts functional differentiation and the coexistence of radically different political organizations (see Barry Buzan, Charles Jones, and Richard Little, *The Logic of Anarchy: Neorealism to Structural Realism*, 1993, pp. 116–21). Another type of neorealist theory of the state would focus on the effect of malign and benign external security environments on domestic institutional choices. A long tradition in both IR and comparative politics suggests that democratization is precluded when states face severe external threats but becomes a more attractive option when threats subside. By suggesting that decision makers weigh their options based primarily on an assessment of international constraints and opportunities, this "second image reversed" proposition is also consistent with neorealism's hard core. Cederman fails to address either of these arguments.

In contrast to neorealism, Cederman views state actors as Janus-faced, confronted with both international and domestic constraints (pp. 122, 134, 148, 151–2, 217). Specifically, he argues that leaders of multinational states must respond appropriately to external and internal challenges. State-building strategies that devote too much energy to one set of pressures increase the state's vulnerability to external intervention or internal secession (pp. 217, 228). Because state agents need to consider international and domestic consequences, a cautious approach to nationalist mobilization is preferable. Cederman's case studies persuasively demonstrate that state agents who push mobilization too far or too fast provoke national unrest; instead of advocating instant democratization, reformers should use "both the gas and the break" (p. 176). Nonetheless, much of Cederman's argument is consistent with a neorealist reading of international politics, which suggests that decision makers take their cues more from the international environment than from domestic politics. Consider Cederman's explanation for nationalist coordination. Although he argues that in multinational, culturally fragmented states the balance of power between the center and the periphery goes far in explaining the emergence of national identities, he also suggests that the severity of external threats affects whether peripheral identities will become encompassing and inclusive (p. 219). Thus, for instance, Yugoslavism gained more support in Croatia and Serbia as external pressure from Italy intensified. The perception of weakness and fears of external intervention made it easier to "paper over" Croat-Serbian differences and accept a more inclusive identity (pp. 207–8). In addition, Cederman makes the common mistake of equating balance-of-power theory with neorealism (p. 215), thus overlooking

the extent to which his findings are compatible with alternative neorealist theories. In particular, the variability and historical contingency of balance-of-power politics and the prevalence of "hegemonic takeoffs" (chap. 4) is inconsistent with what Waltz's theory would lead us to expect but is perfectly compatible with offensive neorealism and power transition theory.

While Cederman sees his study as a challenge to neorealism, he places it firmly within the constructivist camp. Indeed, his objective is to "combine formal modeling techniques with the insights of sociologically oriented perspectives outside of mainstream IR theory" (p. 6). But despite the insistence that states and nations are socially constructed (p. 19), nonmaterial variables and processes do not figure prominently in Cederman's analysis. In explaining whether the international system will expand or contract, for example, the Emergent Polarity Model contains three independent variables (the proportion of predators, defense dominance, and defensive regional alliances), none of which includes a nonmaterial, normative, or sociological dimension (p. 78). Nor is there any discussion of how new norms of sovereignty and self-determination increase the number of actors in the international system. For example, one possible mechanism is that by reducing the legitimacy of predatory behavior and giving state preservation the status of an international principle, sovereignty becomes a nonmaterial resource for otherwise weak states. Moreover, in Cederman's models, socially constructed beliefs do not play much role in giving internal and external enemies clues about when military action might pay.

Because it aims to convince readers of the merits of CAS modeling, *Emergent Actors in World Politics* adopts a method-driven rather than a problem-oriented position. Cederman focuses as much on the framework as on what is to be studied. One quickly gets the impression that he is at least as interested in showing readers what the CAS model can do—and the variety of IR topics to which it can be applied—as in the problem of nationalism, state disintegration, or balance-of-power politics per se. The result is a book packed with important but somewhat disconnected findings on a wide range of issues, many of which do not receive the attention they deserve (e.g., competition often generates unipolar systems instead of balances of power, p. 106). In particular, the chapters on polarity—a structural variable—appear out of place in a book devoted to the domestic processes of state/nation formation and disappearance.

These points aside, *Emergent Actors in World Politics* is an impressive book that nicely weaves cutting-edge formal modeling and counterfactual thought experiments with a diverse set of real-world examples. Cederman's empirical knowledge is particularly impressive. He effortlessly shifts from historical to contemporary cases, providing insights into nationality formation and nationalist reactions within the Habsburg Empire, the European Union, Yugoslavia, and the Soviet Union. Although not for the IR beginner, experts looking for an intelligent study that goes beyond the typical should find Cederman's book good value for the money.

Promoting Asia-Pacific Economic Cooperation: Perspectives from East Asia. By Yong Deng. New York: St. Martin's, 1997. 194p. \$65.00.

Danny Unger, *Georgetown University*

Initiatives aimed at boosting cooperation in the East Asia and Asia-Pacific regions increased in number and significance in the 1980s. Areas previously striking for the relative absence of formal institutional mechanisms to foster cooper-

ation saw a heightened pace of official meetings and the emergence of a host of new institutions culminating in the launch of the Asia-Pacific Economic Cooperation (APEC) group in 1989. These events prompted analyses probing the causes of this sharp upturn in interest in regionalism, its links to Japan's economic rise, the extent to which an incipient regional identity had emerged, and the causal relations between enhanced regional institution building and ongoing economic integration. Deng notes that one result is increasingly sophisticated (Western) analyses of these developments, although most of the more recent contributions fail to give due attention to the perceptions of the Asians who played central roles in driving these processes forward. Hence, Deng centers his analysis on the contributions of the ASEAN countries, China, and Japan.

Deng argues that developing regionalism in East Asia and the Asia-Pacific is striking because of the heterogeneity of the states and the limited roles that dominant states have played in the process. These features pose important theoretical puzzles that international relations theorists have tended to ignore. Deng finds it particularly striking that the outbreak of regime building in the Asia-Pacific coincided with a relative decline in U.S. power. The limited leadership exercised by dominant states underlines the importance, Deng argues, of international regimes and the need to change the ways in which we think about regimes. In particular, we need to give less attention to international structural variables and more to the roles of shared perceptions and common social purpose.

Deng offers an interesting discussion of the regional order under Chinese leadership—the tribute system that waxed and waned over several centuries until overrun by imperialism and the rise of Japan. Consistent with some interpretations of U.S. hegemony after World War II, Deng suggests that whatever the value of trade relations for other participants in the system, in the eyes of Chinese state officials these relations were primarily of cultural, moral, and political significance. The tribute system created an intermeshing of relations among states that featured a flexible assortment of means available to actors within the system in pursuing their diverse ends. These features to some degree foreshadow the nature of contemporary institutions in the region and, in particular, the preferences of most Asian officials in crafting regional institutions.

Chapters on Japan, China, Sino-Japanese relations, and the ASEAN countries comprise the overwhelming bulk of the book. These are clearly presented and offer diplomatic chronologies useful for reference or classroom use. Unfortunately, the material overlaps to a considerable degree, and the intended focus on East Asian actors (or sources) is not particularly strong.

The book has a few weaknesses. In his discussion of APEC, Deng mentions only two (liberalization and economic cooperation) of the institution's three "pillars," ignoring the trade and investment facilitation agenda. Given the limited degree to which the liberalization norm is embraced within East Asia, this last agenda assumes special importance. Deng makes the interesting argument that international structural variables may not offer us the most useful explanation of regime building in the region. More generally, he suggests that the conceptual tools developed to study regime formation in Western Europe may be inadequate to understanding processes in East Asia. Yet, he identifies the literature on regimes closely with the hegemonic stability thesis, despite his frequent use of concepts developed by scholars outside that tradition. Ultimately, Deng distances himself somewhat from the argument that the international structure of power may not be a critical explanatory variable; in his concluding

chapter, he emphasizes the lack of leadership in accounting for the weaknesses of regional regimes. Perhaps the book's greatest weakness is the relative absence of an analysis of domestic politics. Deng argues that state-society relations in East Asian countries vary systematically from those of the West, but he does not develop the potential importance of this assertion as an explanation for distinctive patterns of institutional development. In particular, the Asian emphasis on voluntary (rather than negotiated) liberalization removes the two-level game dynamic from the process. This loss is not great if officials enjoy trade policymaking autonomy. Given the rapid expansion of political participation in most East Asian countries, however, this point seems to merit more attention than it receives here.

Scholars and policymakers have devoted a lot of attention to the alleged tensions within APEC between those ("Western" states) favoring the creation of a formal institution fostering binding, contractual agreements and those (Asian states) opting for flexible and informal arrangements rooted in consensual interaction. However easily subject to caricature, this is a critical issue because it encourages us to consider the relative importance of conceptually distinct (legitimacy and social consensus versus authoritative enforcement) underpinnings of social orders and cooperation. Deng is alert to the issue's importance, but he ultimately does not offer novel insights into the sources of these different emphases, the extent to which such differences in fact exist, or their implications.

This book does not help us much in deciding what kinds of questions we should be asking about the emergence of a social order in the Asia-Pacific region. By what criteria should we decide whether or not it is surprising that cooperation has emerged without significant leadership from dominant states? Has there in fact been enough cooperation or institution building to justify surprise? Is it clear that dominant states have played such modest roles? How should we think about the networks of Japanese firms that have fostered industrialization and expanded investment and trade flows across the region? Do these developments have anything to do with the Japanese state itself? Deng's emphasis on the interaction of economic and security issues in the region encourages us to ask whether the role of the United States has been as limited as his discussion suggests. Similarly, the heavy dependence of the East Asian states on external actors—the International Monetary Fund and the United States—in the wake of financial and foreign exchange crises beginning in 1997 leads us to ask just how much of an anomaly the region presents to us.

Scholarship is no less trendy than the culinary arts, although fads relating to the former tend to take longer to gain momentum and longer to fade away. Despite the dramatic decrease in U.N. operations since the mid-1990s and their falling popularity, literature about them is continuing to proliferate. The initial enthusiasm accompanying the first

wave of new U.N. peace operations, beginning in 1987, led to a flood of publications. In an English-language database of pertinent articles, book chapters, books, and reports published from 1989 to 1996, there are 2,200 entries that vary immensely in quality and sophistication (Cindy Collins and Thomas G. Weiss, *An Overview and Assessment of 1989 to 1996 Peace Operations Publications*, 1997; also http://www.brown.edu/Departments/Watson_Institute/peace_operations/index.html). Much of the supply of this literature was, and continues to be, driven by demand. Funding for studies has emanated from governments and foundations; and authors (ranging from seasoned analysts to graduate students) who might have been involved in less financially rewarding and unpopular areas of interest have turned their attention and computers to this arena. The ease with which expert status was attained led to a rush to get publications into circulation. A decade later, however, we should expect more reflective, structured, and comprehensive analyses and fewer broadly gauged prescriptions and descriptions.

These three books aim to update our knowledge about completed U.N. operations of the late 1980s and early 1990s; the only case found in all three books is Cambodia, although El Salvador figures prominently in *Keeping the Peace* and *Casualties of the New World Order*. Neither *Conflict Neutralization in the Cambodia War* nor *Casualties of the New World Order* offers a compelling argument for what they purport to discuss. *Keeping the Peace*, however, is carefully crafted and merits serious attention from scholars and practitioners.

Neither *Conflict Neutralization in the Cambodia War* nor *Casualties of the New World Order* specifies clearly enough the basis for judgments about "success" or "failure." The authors do not clarify adequately the inescapable value judgments, differing time frames, and multiple objectives used by various actors, or the hidden agendas that are the essence of world politics. In examining critical peace operations in the last half decade, for instance, one could legitimately ask: Have military efforts in northern Iraq been a success because 1.5 million Kurds were saved and are still alive, or a failure because without a political solution Saddam Hussein is ensconced in Baghdad and flaunting international decisions? Were military operations in Somalia successful because death rates dropped in 1993, or a long-term failure because billions were spent to stop the clock temporarily? Were U.N. military efforts in Bosnia in 1992–95 successful because they saved lives and avoided a wider conflict in Europe, or a failure because the community of states did not stand up to aggression, war crimes, and the forced movement of peoples and chose a type of intervention that may have perpetuated the conflict? Were military and police operations to restore President Aristide in Haiti a success because a precedent against a seizure of power by a junta was set and peaceful elections for his successor held, or a failure because fundamentally skewed economic structures remain in place to exploit the vast majority of the population? Were military efforts in Rwanda in 1994 a success because the carnage was stopped and lives saved, or a failure because the genocide took place and violence spread to new theaters?

Answers to such questions can be affirmative or negative, depending on an analyst's criteria. Readers of the books by Peou and Wesley will have difficulty with the characterizations of success or failure. These published versions of doctoral dissertations add little to contemporary scholarship or policy analysis.

Conflict Neutralization in the Cambodia War is yet another case study about the United Nations Transitional Authority in Cambodia (UNTAC). Peou, of Cambodian origin, mixes first-hand interviews with secondary sources along with un-

derstandable but regrettable passion in his treatment of the war and the subsequent U.N. presence. He develops the notion of a psycho-structural approach called "conflict neutralization," which "is defined as a political process whereby military conflict can be rendered inactive by a legitimate authority (a third party) through democratic means" (p. 10). He is trying to avoid the possible paralysis that would result from taking adequately into account the legitimate criticisms by the two main types of observers who have lamented U.N. failure: the "socio-cultural institutionalists," whose pessimism is based on the idea that outside imposition of western-style democracy on a country like Cambodia is bound to fail because there are no preconditions or cultural affinities; and the "legalists/moralists," whose pessimism is based on a more cogent argument that U.N. efforts did not punish Khmer Rouge war criminals and even included them in the peace process. The author immodestly strives not only to "make the world safe for democracy, but also sow the seeds of democracy in order to make the world more secure for humankind" (p. 10). He seeks a middle ground between consent (which paralyzes the U.N. and also does not address the insecurity dilemma of belligerents) and military coercion (which has the disadvantage not only of reflecting the Permanent 5's foreign policy interests but also often of leading to more violence). Insights are less numerous than platitudes, such as the book's final paragraph (p. 304): "Member-states must consider doing more rather than becoming increasingly cynical and doing less. . . . Although it will never be in the position to create a strife-free Utopia, the UN is the only global body with the best potential to keep its members thinking collectively about what they can do to prevent hell on earth from breaking loose."

Casualties of the New World Order is an unsuccessful attempt to discover what the book's subtitle describes as *The Causes of Failure of UN Missions to Civil Wars*. Wesley is unpersuasive in explaining why he considers U.N. mediation in El Salvador a success but a failure in Bosnia, peacekeeping is useful in Mozambique but not in Somalia, and election monitoring is sensible in Cambodia but not in Angola. But a more significant shortcoming is the comparison of unlike cases. Conflicts that predated the end of the Cold War are compared with ones that arose afterward, and traditional "peacekeeping" in Mozambique is compared with enforcement in Somalia. From this lack of clarity emerges the unsurprising explanation that "coalitions" (by which the author means "troop contributors" and not the "coalitions of the willing" that have been used in the Gulf or in Liberia on "subcontracts" from the U.N.) determine mandates and the shape of military forces, and the "failings of UN missions derive from significant structural weaknesses that lie within the mission and their method of dispatch by UN member-states" (p. 1). On the same page Wesley sees a particular problem in the present generation of intrastate conflicts because "the failures of UN missions are attributable to common structural weaknesses that are especially vulnerable to resistant civil war conflict dynamics." That the missions, mandates, and force postures of U.N. operations reflect the foreign policy interests of the member states of an intergovernmental organization, particularly those that contribute soldiers, should not come as much surprise. Indeed, such logic is remarkably similar for international or noninternational armed conflicts. Wesley is off the mark in arguing that diverse and contending perceptions of issues and vital interests, along with the desire to minimize costs and commitments, are phenomena that influence state contributions after the Cold War's end. They have always been the essence of international decision making about U.N. operations.

Although publishers and promotion committees dislike edited volumes, books like *Keeping the Peace* should give them pause. This is not a collection of unrelated chapters tied together only by a common cover; rather, it is a carefully designed and persuasively argued comparative analysis of U.N. operations in Cambodia and El Salvador. This book is superior to most single-author volumes because of the specialized knowledge and expertise brought to bear by a combination of academics with practical experience and practitioners with analytical bents. This is crucial because too few scholars go to the field as participants in peace operations, and too few practitioners write about their experiences. The comparison focuses on two examples of "multidimensional peace operations." And despite obvious differences between the cases, the discussion of Cambodia and El Salvador provides comparable data. The editors selected the middle ground between traditional peacekeeping and enforcement largely on prescriptive and policy-relevant grounds—because "traditional peacekeeping and peace enforcement, are less likely to shape the UN agenda in the years ahead" (p. 3). At the same time, this selection has important methodological and conceptual consequences, which make the conclusions comparable across the two cases. Parallel and, for the most part, very high-quality chapters focus on, respectively: the roots and development of the two conflicts; mediation; legal perspectives on peace agreements; maintaining law and order; central civilian administrative functions; and key humanitarian, economic, and social dimensions of peace processes. On the question of success and failure, the editors devote part of their concluding chapter to justifying their "unscientific . . . [and] eclectic approach" (p. 370) and to examining their justifications for the mixtures of success and failure in both Cambodia and El Salvador. Some of the conclusions are important and straightforward (for example, the importance of an agreed settlement); others are surprising and little documented (for example, the possibilities for enhancing consent through such mechanisms as the "friends" of the country in crisis); and others are counterintuitive (for example, the importance of multidimensionality—or having eggs in several baskets—so that "failures of specific aspects of the program are not enough to destroy the entire mission" [p. 387]). In short, this insightful volume adds to the literature and merits careful perusal.

A final word is in order about a notion that explicitly or implicitly appears in all three volumes as well as in numerous recent conferences. "Lessons learned" has become something of a buzzword in post-Cold War parlance. The rush to create lessons-learned units at the United Nations and elsewhere, however, is not to be confused with the learning of lessons. To the extent that many of the so-called lessons remain relegated to file drawers, coffee tables, or books, the concept of learning is perverted. The assignment is to identify and examine not only key issues and events that have challenged and sometimes paralyzed peace operations but also creative institutional responses that actually have been institutionalized. Organizational learning, like individual learning, occurs in three stages: identification (when problems are observed and data collected); diagnosis (when information is analyzed and discussed, including causes, earlier responses to similar problems, and underlying beliefs and assumptions); and implementation (when revised policies and procedures are institutionalized).

Clearly, well informed is preferable to shallow identification and diagnosis. Whether one agrees with this reviewer's judgments about these volumes, the identification of problems and the formulation of possible solutions are necessary but insufficient without concrete implementation measures

that address identified and diagnosed problems. If the resources or the will to take action are missing, learning has not taken place. In this respect, there has been precious little "learning" by governmental, intergovernmental, or nongovernmental organizations regarding U.N. peace operations, despite the so-called lessons compiled in *Keeping the Peace* and elsewhere.

Taiwan's Security in the Changing International System. By Dennis Van Vranken Hickey. Boulder, CO: Lynne Rienner, 1997. 233p. \$49.95.

Wei-chin Lee, *Wake Forest University*

Taiwan has moved by leaps and bounds toward market liberalization and political democratization since the late 1980s, but its security vis-à-vis China has remained at the forefront of international concern. Not only might mischief or miscalculation on either side of the strait cause regional instability in East Asia, but also the consequences would surely pose a daunting challenge to U.S. global security regime design. There is a pressing need to examine the issue of Taiwan's security thoroughly, and Hickey has responded with a broad study of the situation since the end of the Cold War.

In Hickey's view, post-Cold War structural changes mean that the "China card" has lost its magic in containing the defunct Soviet Union. A kinder, gentler world has created opportunities for Taiwan to enhance its security in a radically different strategic environment. Arms acquisitions, primarily from the United States, have become less restricted. Taiwan's pragmatic diplomacy has more maneuvering room and reaches a more receptive audience. Most important, freed from the straitjacket of the Cold War, the United States has shown the courage on several occasions to say "yes" to requests from Taipei which would have received a flat "no" in the past. Nevertheless, the euphoria generated from a friendly international system has been cut short by hostile domestic political developments in China. With its historical claims over Taiwan, staunch nationalistic sentiment, and unending leadership power struggles, China seems determined to achieve its goal of unification with Taiwan at any cost. So, as Hong Kong fever cools, the heat increases on Taiwan. But unlike Hong Kong, which had few chips on the bargaining table, Taiwan is a formidable player.

The strength of this book is its broad conceptual framework of national security. In relation to a face-off with China, Taiwan's national security is examined by incorporating both military and nonmilitary dimensions. In addition to the usual considerations of structure, composition, arms acquisition, and defense planning by Taiwan's military forces, this study treats the ramifications of continuous democratization and growing economic clout, the consequences of diplomatic efforts, and the interplay of triangular relations among Taiwan, the PRC, and the United States. In line with the recent trend of linking domestic politics to international relations, Hickey also provides readers with a brief overview of the Taiwan independence movement and explains how, in its extreme forms, this movement undermines Taiwan's security.

Ultimately, Hickey suggests that the United States should maintain the status quo in keeping with the terms of the Taiwan Relations Act of 1979 by ensuring the island's adequate defense capability. While the United States should actively support Taiwan's membership in nonpolitical intergovernmental organizations to help dampen sentiment for de jure independence from China, "it is *not* in the U.S. interest to promote, assist, or otherwise encourage Taiwanese inde-

pendence" (p. 196). Furthermore, Hickey argues the United States should avoid becoming a mediator or guarantor of any future agreements between the PRC and Taiwan, except to encourage bilateral dialogues. Hickey points out that it would be a mistake for Taiwan to expect the U.S. cavalry to ride to the rescue in a crisis, although some Taiwanese politicians would disagree with this assertion.

It is undeniable that among players in the delicate U.S.-China-Taiwan triangle, Taiwan exercises the least influence. What might be good for the United States is not necessarily good for Taiwan, meaning that the island is potentially expendable when U.S. security and global structural changes become overriding issues. Both Taiwan and China benefited with the burial of Cold War rhetoric. The move toward a multilateral approach to conflict resolution has given China leverage and a role to play in global affairs. This new status enables it to pressure other nations, including the United States, into accepting China's policy toward Taiwan.

Hickey must be commended for attempting to present a full picture of Taiwan's security. At some points, however, his treatment is not extensive enough, and he falls somewhat short of illuminating the significance and complexity of an issue. For example, security policy options, decisions, and strategies are closely associated with the perceptions, capabilities, and credibilities of all players involved. Thus, while this book treats Taiwan's own perception and assessment of its security and the U.S. evaluation of the balance of power across the strait quite fully, it forgoes a similarly extensive analysis of China's perception and the debate among its domestic elite. In contrast to the copious citations of and quotations from documents and interviews with Taiwanese officials, sources from China are relatively slim. China is, after all, the primary threat to Taiwan. Likewise, given that "Taiwan is probably the noisiest democracy in Asia" (p. 105), readers may wish that Hickey had explored the independence movement at greater length, particularly its internal bickering and the nature and actions of its various parties, factions, and elite groups. On this issue, even President Lee Teng-hui's statements have often generated different readings and responses. More analysis would have helped readers appreciate the complexity of this crucial issue and the challenge it presents for U.S. policy.

Readers will learn a great deal about U.S. efforts to assist Taiwan's military modernization from Hickey's wealth of data and information. Arms transfer has been crucial to Taiwan's security. Yet, one cannot resist asking why Taiwan had to purchase weapons from sources other than the United States when it was fully aware of the U.S. criticism of "operational liability," that is, of weapons incompatibility if arms are procured from different suppliers. If the United States had been actively involved in Taiwan's indigenous defense fighter (IDF) design and production, then why was it described as the world's most expensive jet fighter and the IDF ridiculed as meaning "It Don't Fly"? If Taiwan is really operating in a buyer's market as most people claim, then why did it lease U.S. Knox-class frigates, which are refurbished and updated "old-timers," instead of buying new ships? Why did Taiwan have to pay higher prices than other buyers for French LaFayette-class frigates, complete with unexplained "extra" fees tacked on? The suspicion arises that foreign suppliers are playing one side off against the other, charging Taiwan a premium for arms, while keeping up their cozy, cordial relationship with China. An analysis of these international intrigues might not alter Hickey's conclusions, but it would shed more light on the effect of global structural restrictions upon Taiwan's security vis-à-vis foreign arms suppliers.

Despite such minor quibbles and regrets, it can be said that this book is a nice addition to the study of Taiwan. Viewing Taiwan's security across such a broad spectrum is admirable, and anyone seeking to understand the issue of Taiwan's security and the uneasy tango that China and the United States will dance in the future will find this book a useful reference. The United States has a strong commitment to Taiwan arising from its long-term historical ties, legal obligations, economic incentives, and abiding interests in promoting and preserving democratic values. If Taiwan ever decides to declare formal independence through democratic means, what would the United States do? Hickey's study provides the basis for formulating an answer to this and other provocative questions about Taiwan's future.

Imagining War: French and British Military Doctrine between the Wars. By Elizabeth Kier. Princeton, NJ: Princeton University Press, 1997. 240p. \$39.95.

Robert A. Doughty, *U.S. Military Academy*

Despite the title, Elizabeth Kier's book is less about French and British military doctrine between the wars than about the influence of "culture" on the development of doctrine. Since military organizations, she argues, develop strong collective understandings about their role and missions, their cultures influence doctrinal development. To prove this point, she begins by analyzing Barry Posen's and Jack Snyder's studies on doctrine, and she questions whether "balance-of-power theory" adequately explains doctrinal development and whether military organizations inherently prefer offensive doctrines. She then reviews French and British interwar experiences to demonstrate how military cultures influence doctrine, and not surprisingly she concludes that its shaping is best understood from a cultural perspective.

The greatest significance of this book is that its central ideas should replace simplistic notions about doctrine that currently exert great influence. Specifically, some military historians have long understood the complexity of doctrinal development, particularly the uniqueness of individual armed forces' experiences and the wide variety of factors influencing those experiences, but other military historians and political scientists have favored simpler explanations. Hence, Kier's argument is a welcome antidote to the prevailing but inadequate models, and it is hoped that the book will lead more scholars to acknowledge the complexity of doctrinal development.

The main strength of the book is the author's extensive research. Instead of relying excessively on secondary materials, she has conducted archival research in Paris and London and has reviewed many of the contemporary military journals and periodicals germane to her subject. Her impressive command of the literature also is evident in the lengthy bibliography. Though Kier could be criticized for seeking only evidence that supports her thesis, her extensive research not only adds credibility to her argument but also provides her the insights necessary to understand and convey the intricacies of a complicated subject.

Notwithstanding the considerable strengths of this book, it has several weaknesses or points with which an historian could disagree. First, though Kier carefully explains what she means by culture and organizational culture, she never clearly defines doctrine. Even worse, her usage of the term sometimes suggests she is considering strategy instead. The distinction is important because the French and British had different approaches to doctrine—both in role and content—during the interwar period and because recent authors have

sometimes folded a wide variety of incongruous ideas under the broad umbrella of doctrine. The importance of a definition is most evident from the variety of approaches and definitions current among the U.S. armed services and Joint communities.

Kier also lapses into jargon that most historians (and perhaps some political scientists) would not understand. When she investigates, for example, whether "culture has causal power," she asserts: "Some of the recent work adopting a constructivist approach argues that certain epistemologies are inappropriate for examining the role of intersubjective factors" (p. 33). Such sentences not only lessen the chances that historians will find much value in her book but also weaken her argument by obscuring her points beneath a cloak of code words which have meaning only to her intellectual community. In particular, portions of the book dealing with theory contrast sharply with the clear, coherent, and persuasive writing in the four chapters focusing on historical events in France and Britain.

Of the several points with which one could disagree, a particularly important one pertains to the nature of offensive or defensive doctrine. Throughout the book, Kier argues as if the two were not interrelated. Her tendency to blur the distinction between strategy and doctrine adds to her willingness to place an intellectual firewall between offensive and defensive doctrines. In reality, neither Britain nor France consciously "chose" a doctrine that was solely offensive or defensive. Instead, they emphasized one or the other but retained essential elements of both. In France, doctrine envisaged first the weakening of an attack by a defender's fire and then destruction of the enemy by a massive and tightly controlled "methodical battle." To see this view as purely defensive is to distort the outcome of a very long and elaborate process.

One also could disagree with Kier's insistence that French politicians deferred to the military on questions of doctrine. Though the French obviously emphasized the offensive more in the 1920s than in the 1930s, the military did not have the freedom to adopt a solely offensive doctrine in the 1930s. The key restraint appeared in the late 1920s, when several laws on the organization and employment of the army assured the dominance of reservists and conscripts in any future war. Politicians, however, were not the only ones who supported these laws; General Eugène Debeney, the chief of staff during the late 1920s, later acknowledged proudly his significant role in creating "this solid infrastructure" for the army. In reality, France emphasized an offensive strategy in the 1930s because of Germany's weakness, but as that weakness dissipated, neither political nor military leaders in France favored an offensive strategy. Kier insists that "the French army could have adopted an offensive doctrine if it had wanted to" (p. 73), but the combination of the 1927–28 laws, vulnerability of crucial natural resources on the frontier, and experiences of World War I ruled out that possibility. Thus, the French army's organizational culture influenced its development of doctrine, but public laws, previous experience, and ongoing experimentation also shaped doctrine and strategy.

Despite these reservations, Kier's book is a welcome and important addition to the growing body of literature concerned with doctrine. The high quality of her work reflects not only a keen understanding of the doctrinal process but also a willingness to investigate the archival materials essential for such an understanding. Let us hope future works will rely on such materials and also will avoid the vocabulary that have meaning and utility for only a narrow group of scholars.

Britain and the Politics of Modernization in the Middle East 1945–1958. By Paul W. T. Kingston. Cambridge: Cambridge University Press, 1996. 191p. \$54.95.

Robert Vitalis, *Clark University*

Paul Kingston's study of the operations of the first British bilateral aid mission in the Middle East, the Development Division of the British Middle East Office (BMEO), raises problems of value and method in the historical comparative study of development. He does this explicitly by framing a history of this little-known postwar British development agency as a critique of emerging development assumptions of the 1940s and 1950s. These beliefs, which mix political self-interest and selflessness, rely on the big fix and take relatively little notice of local characteristics in designing and implementing programs from the top down; unfortunately, Kingston argues, they still shape thinking about development today, across the divide between neoliberals and many of their critics. Kingston sees in the history of the Development Division an early proof of the validity of some of the alternative local capacity-enhancing "small is beautiful" tenets that would later emerge within the aid industry. He treads carefully yet is unable to avoid the anachronism trap in an argument that reads the past backward in terms of policy debates and conflicts that were not part of the era. Doing so lets him make a modest case for the relative "success" of this now extinct agency. The odd turn of argument also means, however, a missed opportunity to engage multiple historical comparative debates about the course of empire, decolonization, and state and market building for which the period does represent a critical juncture.

The emergence of the BMEO as a precocious institutional pioneer in small-scale, local capacity-building development strategy is an accident of history. According to Kingston, Labor Party foreign minister Ernest Bevin originally envisioned an ambitious postwar initiative in the empire's Middle East dependencies; it would draw on the allies' wartime experience with coordinating the regional economy and would be centered on infrastructure investment and land reform. This initiative was intended, not surprisingly, to shore up the political influence of a declining imperial power by promoting a degree of socioeconomic reform (a "peasants not pashas policy") and, not least, to compete with the American engineering and heavy industry exporters in these markets. As Kingston documents, this Labor Party "version of the 'white man's burden'" never stood a chance against the opposition of Treasury, which refused to fund the initiative, the inability of hard-strapped British firms to supply the goods, a shortage of technicians to staff it, and resistance from Egyptian and other nationalists. Without the ability either to supply the capital on which infrastructure development depended or to persuade the Americans to underwrite the British initiative, there was little choice but to scale back plans, concentrate on reliable clients (Iraq, Jordan), and turn to places like Cyprus, where rival foreign aid agencies were less interested.

Kingston uses case studies of BMEO's work in Iran, Iraq, and Jordan to show how a small committed cadre of British technicians was paradoxically liberated from both political "shackles" and the rapidly emerging orthodoxy of big is beautiful to the ultimate benefit of local institutions. This alternative model looks even better, Kingston insists, when compared to the record of U.S. Point IV aid or U.N. programs in the Middle East. The initiative in the late Truman era suffered the combined flaws of TVA-sized imaginations, Americans' antistatist bias, and a no less rigid understanding of how to implement inappropriately designed

projects. The account ends in 1958, at a point when Britain's efforts to salvage its influence in the region's political and economic order, which had already been set back by the debacle of the 1956 Suez War, suffered the further loss via revolution of a client regime in Iraq. In a brief concluding note, Kingston tells us that the potential lessons of these years were lost as official aid efforts in the 1960s and 1970s turned in the more conventional direction of subsidizing sales of British goods and services, before budget cutbacks led the Thatcher government to disband the Middle East Development Division in 1981.

Among the many strengths of this book, Kingston mines the declassified records of the British and, to a lesser extent, U.S. governments for material on the political economy, an integral dimension of the historical process that diplomatic historians, who routinely use such archives, tend to overlook. He also extends his search to archives, notably of both the BMEO and of Point IV (formally, the Technical Cooperation Administration), that remain woefully unexplored. The result is an original contribution to the historiography of decolonization. The chapter on Jordan is particularly fine. The author's careful and sober judgment extends to recognizing that his work remains open to (serious) revision, given its heavy reliance on British documents, relatively scant source materials in Arabic or from within the region, and a more cursory treatment of the American side. More critical still, Kingston recognizes that the makeshift strategy of the British technocrats in the 1950s has no real historical connection to the radical strains of populism and romantic anticapitalism that actually fed the small-is-beautiful critiques of the 1970s, or to the latest 1990s wave of grass-roots-oriented development strategies.

Acknowledging these complications does not, however, solve the problems created by the author's "presentism" or the choice to write the history as if these debates were foreshadowed in, and somehow settled through, this study of contrasting British and U.S. aid programs. The author does not provide a test of the alternative top-down and bottom-up models, for example, by attempting to trace the institutional or local capacity-enhancing effects of each. (He concedes that the small-scale British projects had no effect on income growth or poverty reduction.) Kingston's evaluation is ultimately tautological. Small-scale, bottom-up projects are by definition better at enhancing institutional capacity; the BMEO's approach was small-scale; hence its efforts were a success.

Kingston has missed a chance to integrate his work with other studies of decolonization and development in the early postwar years and to contribute to the multiple, ongoing debates in historical comparative theory that center on this era. For example, his findings challenge those who argue that British imperial power continued to "control" and "dominate" the economies of Egypt, Iran, Iraq, and so on; as Kingston shows, the Bevin government was unable to launch much less consolidate the development initiative on which its postwar position in the region depended.

His work matters as well to our understanding of the real clash of ideas and interests in the early postwar development policy arena. Kingston shows much less familiarity with the evolution of discourse and action in the 1940s than in the 1990s. The author notes without comment that the BMEO showed little interest in developing manufacturing capacity in Iraq and Jordan in the 1940s and 1950s. If true, then this "progressive" postwar British initiative in local development was a reversal rather than extension of the wartime efforts, under joint Anglo-American direction, to create import-substitution industries in the Middle East. Kingston's inter-

pretation of American development ideas and the history of Point IV is even more flat and one-sided (not least because he relies so heavily on British sources). His positive view of BMEQ depends in part on the contrast with the Americans' allegedly powerful and visceral antistatist bias. Yet, the Point IV archives document active and regular U.S. support for building state-owned infrastructure and import-substitution manufacturing in the region, consistent with the evolution of U.S.-backed ISI programs outside the Middle East in the same period.

Regional Orders: Building Security in a New World. Edited by David A. Lake and Patrick M. Morgan. University Park: Pennsylvania State University Press, 1997. 406p. \$55.00 cloth, \$19.95 paper.

Benjamin Miller, *Hebrew University of Jerusalem*

With the end of the Cold War there is a strong impression that processes of globalization have become very powerful. At the same time, some analysts have noticed, quite to the contrary, increasing regional variation, especially the regionalization of security, rather than global uniformity. The Lake and Morgan volume on regional orders is a major new contribution to our understanding of the great variety of regional orders emerging in the post-Cold War era. Together with some other recent volumes on regionalism, it serves as a useful antidote to purely systemic analyses and especially to the widely assumed increasing globalization of world affairs. The authors demonstrate forcefully the centrality of the regional level for understanding key developments in the security field in the post-Cold War era. At the same time, this first-rate volume goes much beyond an analysis of the uniqueness of different regional systems. In contrast to many books on regional security, which tend to be mainly descriptive or policy relevant, it makes an important theoretical contribution by linking useful general concepts and theories from the international relations field with crucial questions of regional security.

The volume develops the conceptualization of a region, presents a typology of regional security orders, and identifies key independent variables that explain important aspects of regional security. Yet, there is still a long way to go toward the development of a coherent theory of regional orders, especially one that makes sense of the linkages between the global system, on the one hand, and regional/domestic factors, on the other, and their combined influence on regional war and peace. Indeed, without a theory of regional war and peace, it is difficult to evaluate the utility of different conflict-management mechanisms and the conditions for their effectiveness.

The first theoretical contribution of the volume is the development of the concept of a regional security system. In this context, David Lake introduces the idea of externalities (or transborder "spillovers") as producing the strategic interactions central to a regional system. This important concept enhances our ability to identify the boundaries of a certain regional system. It is more useful than pure geographic criteria and less problematic and subjective than the constructivist criterion of regional identity and consciousness. At the same time, the externality notion by itself does not go beyond identifying a regional system and predicting the intensity of the interactions within it. It is unable to explain and predict what will be the nature of these interactions, namely, whether a regional system will be cooperative or conflictual, inclined to war or peaceful.

A second useful contribution of the volume is the devel-

opment of the dependent variable—the classification of regional security orders. Patrick Morgan distinguishes between the classical management of conflict by balancing power and the more collaborative attempts at security management: a great-power concert, collective security, a pluralistic security community, and regional integration. Additional insightful contributions to this typology are made by Paul Papayoanou, who focuses on different types of great power regional intervention, and Brian Job, who discusses the role of multilateral security arrangements, including regional institutions. Rosecrance and Schott elaborate on the mechanism of concerts of great powers. These distinctions regarding security management are a necessary condition for an understanding of regional security. Yet, in order to evaluate their effectiveness and durability, it is necessary to identify the theoretical conditions under which different regional orders are more likely to emerge and endure.

In this regard, the volume identifies three major determinants of regional orders. The first is the structure of the regional system (unipolar/hegemonic, bipolar or multipolar). The second is the international system, including how the area was influenced by the Cold War and its termination (an excellent chapter by Stein and Lobell) as well as the current motivations of the great powers for regional intervention (a first-rate chapter by Papayoanou). The third is domestic political coalitions; most notable in this regard is Solingen's innovative work on liberalizing coalitions, which produce benign/cooperative regional orders, as opposed to statist-nationalist and radical-confessional domestic coalitions, which produce regional instability and conflict. (Israeli Premier Benjamin Netanyahu poses an interesting anomaly: He is both an economic liberalizer and a hard-line nationalist.)

The three key independent variables are significant but problematic. The argument that regional multipolarity is conducive to more cooperative security complexes, even if only in some regions (Africa, East Asia, the Middle East, and ASEAN), seems misplaced and overstates the influence of the regional structure. It makes much more sense to attribute the progress in regional cooperation in these areas either to external influence by great powers (notably the end of the Cold War and U.S. hegemony in the Middle East) or to nonstructural domestic-regional factors (ASEAN and Western Europe). Indeed, the extent of the legitimacy of the regional order, namely, acceptance of the existing territorial order, may provide greater explanatory power. The extent of legitimacy, in turn, depends on domestic-ideological attributes and orientations of the regional states (notably, the power of revisionist ideologies and the degree of state coherence or strength in the region). This only partly overlaps with Solingen's important concept of liberalizing coalitions. Questions for further research are whether such coalitions are a necessary or a sufficient condition for legitimate regional orders, and what are the precise relations between liberalizing coalitions and the democratic peace theory.

The volume also understates the central international factor—U.S. hegemonic leadership in the post-Cold War era. Although, as various chapters suggest, the end of the Cold War opened the way for the evolution of a number of systemic possibilities (such as concert, balance of power, hegemony, and collective security), the hegemonic option has been especially prominent. Rather than a great power concert, a partial unipolarity or U.S. hegemony has emerged since the collapse of the Soviet Union with regard to many regions, notably East Asia, the Middle East, Central America, and the Balkans. At the same time, the volume exaggerates the extent of globalization of regional security during the

Cold War; thus, there is altogether an overstatement of the extent of the change since then. Rather, both types of factors—international and regional—affect regional security in every period, and the challenge of theory is to specify which type of regional security outcomes are best explained by global factors and which type are best accounted for by regional/domestic causes. The theory should also assess the combined effects of the global and regional/domestic factors on regional orders.

To sum up, the general problem of this book, which is typical of many other good edited volumes, is the lack of a coherent theory or a well-integrated theoretical framework to address the general topic, in this case the origins of regional war and peace. Such a theory should not only present causal linkages between global versus regional/domestic factors and variations in regional orders but also explain the effects of global and domestic causes on the extent of regional war proneness. Without understanding the causes of regional wars, it is difficult to know the most effective ways to reach regional peace and to manage conflicts. Thus, such a theory could also be helpful in evaluating the effects of various global and regional mechanisms on the management of regional security.

Notwithstanding this shortcoming, this important volume is a major theoretical addition to the growing literature on regional security. It highlights the rising importance of regional questions for the international relations field in the post-Cold War era, and it deserves a wide audience of both international relations theorists and area specialists.

Anatomy of Mistrust: U.S.-Soviet Relations during the Cold War. By Deborah Welch Larson. Ithaca, NY: Cornell University Press, 1997. 329p. \$35.00.

Alexander Dallin, *Stanford University*

The central thesis of this thoughtful and well-researched volume is "the claim that the United States and the Soviet Union, if not for mutual mistrust, could have reached several significant agreements on security issues [during the Cold War] and that, through sustained effort, they could have overcome such suspicions" (p. 3).

Larson examines five cases—at what she considers "branching points" in the superpowers' relationship—to make her case. They do not include the years commonly seen as the origins of the Cold War but, rather, begin with the immediate aftermath of Stalin's death. The Eisenhower years and the German question figure prominently. The Berlin Wall and Cuban Missile Crisis as well as the arms control negotiations under JFK are the subject of another chapter. A further case covers the Nixon years and the SALT negotiations. Finally, the Reagan-Gorbachev period is the subject of another careful study. One can disagree, now and then, with Larson's allocation of responsibility for failure to improve relations—improvements whose payoff, she implies, would have been above all an increase of "trust." But the story of each "case" is well told, with a fine knowledge of documentary and memoir literature. True, with every passing year new materials appear, and the White House tapes made during the Cuban Missile Crisis and the various recent Russian documents and memoirs would serve to distribute the accents a bit differently. No matter, the major thrust of her analysis is not affected thereby.

Positing that distrust is a key cause of failure, the author sets out to consider three alternative explanations for it: rational choice, domestic politics, and psychological factors. Finding the first two unsatisfactory, she disaggregates the

latter into ideological differences between the partners, historical baggage, and intuitive mental biases. While the case studies are not greatly illuminated by "intuitive mental biases," they are present, clearly and importantly.

A more serious difficulty concerns the concept of trust and its role. Larson tends to equate missed opportunities with mistrust. On the one hand, to pinpoint missed opportunities requires identifying what was "objectively" possible—a very dubious, iffy, and subjective judgment. On the other hand, not all missed opportunities can be attributed to lack of trust. More fundamentally, even leaving aside the questions of defining trust and how much trust is needed in what situation, there were clearly a good many instances in which (for both sides) trust was not in order. The Cuban Missile Crisis of 1962 is a good example—and there are many others—of a situation in which there was not any basis for trust, given Khrushchev's prior assurances. Furthermore, a lack of trust need not be an obstacle to negotiations nor to agreements or treaties if sufficient transparency is built into the agreement or the risks are perceived to be minimal. Indeed, is trust not always conditional, partial, intangible in foreign (as in domestic and interpersonal) affairs? Foreign policy, it can be argued, should always be based on the assumed possibility of justified mistrust. The whole U.S. insistence on on-site inspection in arms control and other forms of verification was based precisely on that assumption; alternating unilateral moves require no significant trust (though confidence-building measures are obviously desirable); and Larson fairly cites the work of scholars such as Robert Axelrod and Charles Osgood to explain the argument.

Agreements between the superpowers became possible not because trust appeared between them but because one side (or both) perceived a change in the other's calculus or behavior. Why was progress on the German question impossible in the 1950s but possible forty years later? It was not because of the miraculous appearance of trust but because of a fundamental change in Soviet behavior, if we compare 1953 with 1989. Trust did not appear suddenly in 1963 when John F. Kennedy delivered his American University speech, yet that changed the atmosphere sufficiently to make possible the negotiation of the first test-ban treaty. Moreover, Khrushchev's eagerness to conclude an agreement with the British and Americans in mid-1963 was due not only to Soviet domestic politics but also (and especially) to his rift with China (which Larson ignores). The real changes in relations came under Gorbachev, thanks to the "new thinking" and the new behavior of the Soviet leadership, not just because of a change in attitudes toward mutual trust.

What does stand out in all the cases is the highly imperfect intelligence and failure to understand, let alone empathize with, the other side: the frequently contradictory and erratic behavior, the misreading of signals on both sides, the divided counsel between rigid ideologists and frequently naive pragmatists (again on both sides), the built-in tendency to resort to double standards, and the importance of individual personalities. Larson makes a good case that the Soviet Union made substantially more concessions than the United States on the road to agreements, and there are perfectly good reasons why this was so.

Of course, one might question the author's assumption that agreements between the superpowers were a worthy end in themselves. Perhaps often they were, but it is something that deserves a fuller argument.

There is no question that mistrust was virtually a constant across the years of the Cold War. Exploring its dimensions and manifestations with the sophistication and skill of this volume deserves applause, and if the answers are not all

satisfactory, the effort is sure to stimulate, inform, and at times challenge the reader.

Dealing with Britain: The Six and the First UK Application to the EEC. By N. Piers Ludlow. Cambridge: Cambridge University Press, 1997. 282p. \$64.95 cloth, \$24.95 paper.

Andrew P. Geddes, *University of Liverpool*

Only four years after the creation of the European Community, the British Conservative government was forced to reevaluate its attitude to European integration and apply for EC membership. The economic benefits of accession were apparent, while the political implications of exclusion also loomed large in the minds of pro-Europeans in Prime Minister Macmillan's cabinet. Britain's first tentative steps toward Europe were, though, rebuffed in January 1963 by General de Gaulle's *non*. "Great Britain," said de Gaulle in June 1962, "is moving toward Europe, but it has not yet arrived." *Plus ça change* . . .

Ludlow's analysis of events between 1961 and 1963 is explicitly "Community centred" and intended as a contribution to EC history. In effect, this means that the focus of the analysis is Brussels and, more particularly, the nitty-gritty of the accession talks between the six EC member states and Britain. The argument is that the negotiations were not a tedious subplot that was largely irrelevant to the final outcome; nor was the final result preordained as a consequence of ingrained French hostility to a potential challenge from Britain to its interests and leadership role. Rather, it was the progress of the negotiations, and attendant problems, which provided leeway for expression of French hostility to British accession.

The detailed analysis of the negotiations has three merits that this book clearly demonstrates. First, it provides insight into the attitude of member states toward European integration at a key stage in its development. A vivid picture of member state preferences and their accommodation in interstate bargains is painted. Another strength is that this is done by making extensive use of primary documentation from the member states and EC.

Second, examination of the negotiations displays the success enjoyed by the EC in its formative years but also highlights the fragility of the achievements and the fear among member states that enlargement might jeopardize the rather fragile deals upon which the European project had been constructed. This point about the community's fragility is illustrated by the position taken by the six in the talks with Britain. The six decided to negotiate *qua* community. This necessitated formulation of common positions on key issues and lengthy meetings at which these were determined before discussions with the British were enjoined. Attempts to forge a united front fell apart in late 1962 and early 1963, when the French acted unilaterally to express their opposition to U.K. accession. Given the centrality of France to the community and the emphasis placed by Adenauer on Franco-German rapprochement as an overriding priority, there was little the other member states could do. Limits upon communitarization were thus displayed, which again came to the fore when the French adopted their "empty chair" policy in 1965.

Third, insight is provided into the enlargement process. In 1961 the member states were venturing into the unknown. Even though Article 237 of the EC treaty laid down the basic rules for enlargement, the organization of the talks was to be determined by the member states. There was no precedent

for enlargement, and the talks with Britain were a case of learning by doing. Moreover, even though Britain was an applicant, it was not prepared to be a supplicant. At times the British seemed arrogant in their assumption that the deals struck at the creation of the community could be unravelled to suit British preferences.

It is, however, the focus on interstate talks and events in Brussels that lie at the theoretical and methodological core of Ludlow's analysis. The attention of the reader is directed toward the talks on agricultural price-support mechanisms, relations between the EC and EFTA, and the shape of postaccession trade links with Commonwealth countries. The slow progress of the talks, which was related in part to British preconditions, presented the French with the opportunity to argue that Britain was not sufficiently certain of its European vocation. Britain's retention of ties to the Commonwealth and United States only confirmed these suspicions and raised the dreaded specter of American influence.

Ludlow's argument is that if the British had been able to express their European vocation in less equivocal terms, then the outcome could have been different. This raises a rather important question: Why were the British unable to express a clearer European vocation? A reliance on analysis of interstate deals within the accession talks and associated summit meetings falls short in its answer to this question because domestic influences on state preference formation are neglected. Political factors in Britain are hinted at in the text but remain peripheral to the detailed assessment of the progress of the talks. Yet, these were febrile times in British politics: Macmillan's Conservative government was unpopular and limping toward its denouement. There were divisions within the cabinet and the Conservative Party over the European issue. Nor was there cross-party consensus in support of accession. In 1962, Labour's leader, Hugh Gaitskell, had expressed clear opposition to European integration and described British accession as a "betrayal of one thousand years of history." Meanwhile, the strains of colonial disengagement and the increased salience of the immigration issue affected reevaluation of Britain's role in world affairs. If the talks failed because Britain was not able to make a clear commitment to the EC, then we need to know why this clear commitment was not forthcoming. At the very least, this suggests interplay between national and EC politics, which in turn suggests that EC history needs to pay closer attention to relations between member state and community politics.

Dealing with Britain is unequivocally centered on the deals struck, or not struck, in Brussels between 1961 and 1963. As such it provides an excellent and authoritative analysis of the state of the EC in that period and makes an important contribution to the burgeoning school of EC history. It demonstrates the tensions between member states and the relative fragility of the European construction at this formative time in its history. The book also suggests a weakness in approaches to EC history that take Brussels as their frame of reference. By laying so much emphasis on the conduct of the talks, domestic influences on state preference formation are neglected. As Ludlow shows, Britain's inability to express a clear commitment to the EC was a major stumbling block for its first application. Clearly, this was associated with difficulties caused by trade and agricultural policy arrangements, which were the meat and drink of the accession talks. It also had, and still has for that matter, a lot to do with British unease about European integration, upon which domestic political factors have had highly consequential effects.

Rush to Union: Understanding the European Federal Bargain. By David McKay. New York: Oxford University Press, 1996. 192p. \$55.00.

The European Union in the 1990s. By Paul Taylor. New York: Oxford University Press, 1996. 204p. \$65.00 cloth, \$22.50 paper.

Alison M. S. Watson, *University of St. Andrews*

When we look back on the history of Europe, more analysis will have been devoted to the question, "Whither integration?" than any other. From state, regional, and local dialogue to debate within and among political parties, the European Union has been scrutinized by economic analysts, political scientists, and social commentators alike. Central to this debate has been the theoretical dimension of European integration, with its emphasis on explaining the dynamics of the integration process and, in particular, where the power in Europe resides. In essence, the question most often addressed is whether increasing integration necessarily implies the diminution of the role of the nation-state. It is with just such an issue that both of the books under review, each in its own way, are concerned.

For McKay, European integration is a "puzzle" with two major dimensions. The first is the timing of European union, and the second is the uniqueness of the European response to the changing economic circumstances of the 1980s and 1990s. In particular, McKay considers why European union occurred in the late 1980s and early 1990s as opposed to the 1950s, a time when the potential for military threat would have suggested the strongest motivation for political federation. The instinctive reaction is to explain recent European union in terms of changing economic conditions, but this is a response McKay rejects. Instead, the unique program of economic integration upon which the European Union (EU) has embarked is contrasted with the experience of other regional economic groupings to form the second part of the puzzle—the distinctive European response of the last two decades. To understand this requires, for McKay, an examination of Rikerian federalism, an approach that blends politicians' motives with the issue of why states form political unions, which synthesizes "the realist perspective of international relations theory with the rational choice tradition in political science" (p. 9). Indeed, it is argued that no other theoretical perspective can provide "such potentially powerful analytic tools" (p. 9).

Thus, *Rush to Union* embarks upon its analysis, in Part I of the volume, of the origins of the EU, encompassing an overview of federal theory and European union in chapter 2, followed by analyses of European union in the periods 1945 to 1982, 1983 to 1992, and 1992 and 1993. It is the examination of federal theory and European union that forms the core of McKay's analysis. After defining the EU as an, albeit incomplete, federal state (an argument based on such factors as the EU's supranational institutional framework), McKay then goes on to provide justification for the use of the rational choice framework, with its emphasis upon the perceptions of politicians in the decision-making process. Such analyses are continued in Part II of the book, with McKay's attempt to define the viability of the EU within the context of "those theories, drawn from political science and economics, which attempt to explain the relationship between fiscal or economic centralization and political centralization" (p. 13). This leads to an interesting analysis, but one which does not always sit well within the confines of the preceding Rikerian framework. In particular, more could have been done to draw out the very real linkages between the domestic political and institutional environment of the individual member states

and the wider EU project. For the latter, this translates into the question of how the structures and policies of domestic political and economic life in the member states interact with the supranational political and economic structures and policies of the EU, and how they in turn operate within the wider international system. Thus, each member state cannot divorce national and domestic interests from their context within the wider European framework. At the same time, however, any set of national interests formulated by a member state must take account of how its policies will fit with those agreed within the context of the wider EU. Such a bargaining process has been prevalent throughout the lifetime of the European integration process. For example, the history of the community consists, to a considerable extent, of the bargains and agreements negotiated among the original six members. In more recent times, the relationship of the original six with new members of the community has been a pivotal factor in the EU's development. Brining out such factors in a more distinct manner would have enabled a fuller justification to be made of McKay's assertion that "only a core of the existing EU states will eventually agree to the creation of a genuine federal state" (p. 178).

Moreover, a further criticism of McKay's work is that there is no mention, in his analysis of the political economy of currency crises in chapter 5, of the issue of credibility in government policymaking. This is something that surely affects the ability of politicians to pursue their domestic policy ideals. Thus, for example, if the electorate is accustomed to the government behaving in such a manner as will influence, say, voting patterns (such as increased government expenditure prior to an election), then the government's professed commitment to a policy (for example, low inflation) will command little credibility. The manipulation of the economy by the government for its own aims will be expected, and private firms and the electorate will thus readjust their expectations up to a point at which the government no longer has an incentive to manipulate the economy for electoral gain. In other words, a government must maintain a consistent policy over time and hence build up a reputation for adhering to a particular policy, rather than engage in an obvious policy cycle designed for electoral advantage. In addition, the nature of the international political economy itself may make unbelievable any promises made by national policymakers to their electorates regarding future domestic political and/or economic behavior. This is due to the fact that the use of economic policy instruments by national authorities is undoubtedly influenced by conditions in the international economy. Thus, national policymakers may simply not have the degree of policy control in the contemporary environment that would allow them to manipulate the economy to their own ends. The link between the domestic and international policymaking environment once again appears obvious.

In *The European Union in the 1990s*, Paul Taylor similarly makes a case for a new theoretical approach toward policymaking. As with McKay, the emphasis is upon the rational actor model, which once again is used to justify the issue of whether increasing integration necessarily implies the diminution of the role of the nation-state. For Taylor, this results in a vision of a Europe which does not threaten the nation-state but which instead "benefits the majority of individuals without threatening national sovereignty" (p. 2). The basis for such a statement runs directly from the way in which Taylor conducts his analysis, and again it is intimately bound up with the notion of the links between domestic and international policymaking. Hence, in chapter 2, where the theoretical foundation for Taylor's later analysis is laid, the

notion is put forward of consociationalism as a way of understanding the European Union. The states are held within a consociation, which is one element of the dual structure that comprises the horizontal linkage between the individual nation-states, and the vertical linkage between the EU nation-states and the EU "collectivity." From this follows the analysis of what kind of membership of the EU is most conducive to its making a positive contribution to the well-being of Europe and the globe. Such arguments are very much bound up with the question of the deepening of European union. In order to justify a full global role, the EU should be viewed in the international sphere as a unified actor. Such an image, however, brings into question the notion, once again, of national identity, the issue of the way in which European integration has affected the identity of people in the EU member states, and, indeed, the manner of their involvement in the agreements of that organization. This is a theme that Taylor elucidates in chapter 5. In particular, and where Taylor's book especially adds to the theoretical analysis of integration in Europe, his attempts to address both the issue of the extension of the range of international organization in the EU and the survival and entrenchment of the state is commendable. Indeed, it is important that we consider the nature of the state and its exact role in the interaction between domestic and international decision making. It must never be forgotten that the six founding members signed a treaty and not a constitution. It is thus the individual member states who control the degree to which Europe integrates. The fact that both McKay and Taylor attempt to deal with the role of the state within a theoretical foundation makes both of their analyses important contributions to the European integration literature.

Anchors against Change: American Opinion Leaders' Beliefs after the Cold War. By Shoon Kathleen Murray. Ann Arbor: University of Michigan Press, 1996. 201p. \$44.50.

Douglas C. Foyle, *Wesleyan University*

Shoon Murray argues that while American opinion leaders' views of the Soviet Union (subsequently Russia) and containment policy underwent dramatic shifts at the end of the Cold War, their broader beliefs about the conduct of U.S. foreign affairs remained fairly stable. This conclusion is based on a panel survey design (surveying the same individuals at two different times) that compares the responses of American opinion leaders in 1988 with their responses in 1992. Murray finds that their broad beliefs about foreign policy along two dimensions (militant internationalism, or the utility of force and containment, and cooperative internationalism, or multilateral efforts to address common international problems) remained constant, even though the global environment changed dramatically during this period.

Using the 1988 Foreign Policy Leadership Project (FPLP) of Holsti and Rosenau as a starting point, Murray resurveyed a portion of these participants again in 1992 in her Leadership Opinion Project (LOP). While preserving the respondents' anonymity, she matched responses from the first and second survey in order to ascertain continuity or change in individual response patterns. Although the FPLP and the Chicago Council on Foreign Relations (CCFR) both undertake quadrennial assessments of views of American opinion leaders, these cross-sectional surveys do not attempt to resurvey the same individuals. These cross-sectional analyses can address the question of static constraint, which Philip Converse defined as "given initial knowledge that an individ-

ual holds a specified attitude, that he holds certain further ideas and attitudes" (p. 4), but they cannot address the question of "dynamic constraint," which Converse defined as "the probability that a change in the perceived status . . . of one idea-element would *psychologically* require, from the point of view of the actor, some compensating change(s) in the status of idea-elements elsewhere in the configuration" (p. 5). Murray's panel survey adds to our understanding of belief systems by evaluating the extent of dynamic constraint in the views of American opinion leaders.

Murray finds stability in individual beliefs on militant and cooperative internationalism, domestic policy preferences, and domestic ideological orientations but not in attitudes toward the Soviet Union/Russia and containment policy. Unlike some previous scholars, Murray concludes that views toward the Soviet Union and containment did not provide dynamic constraint on an individual's attitudes toward other issues or broader beliefs. Instead, Murray finds the evidence is consistent with the conclusion that "domestic ideological orientations" (an individual's conservative or liberal leanings) constrain both domestic policy views and "basic foreign policy postures" (pp. 6-7). As a result, even though international circumstances dramatically changed, Murray concludes that, "because leaders draw upon long-held values to evaluate new international circumstances, their beliefs about the proper way to conduct foreign policy were largely unchanged" (p. 8).

Murray develops her argument across several data-filled chapters. Chapter 2 recounts changing elite views toward the Soviet Union from the 1970s through 1992. Not unexpectedly, Murray finds in the FPLP, CCFR, and LOP surveys that, to varying degrees, elites shifted from a view largely skeptical of the Soviet Union's intentions and favoring containment policy in the period before the fall of the Berlin wall in 1989 to a much more benign attitude in 1992 toward Russia and with significantly less support of containment. None of this is surprising, but the survey data provide the foundation for the later analyses. More distracting and of less value is an extensive historical discussion, based on the author's interviews of officials and their public statements, which tracks the evolution of the policymaking community's struggles to make sense of Mikhail Gorbachev's policies in the 1980s. Given the book's extensive survey data, the detailed views of high-level officials who were not in the LOP survey seem mostly tangential. Since Murray's presentation and discussion of the survey data are sufficient and accomplish her purpose, a brief summary of historical events could have established the context for her analysis of the LOP data.

Chapters 3 and 4 contain the empirical core of the book and provide the main contribution to the literature on elite beliefs. Chapter 3 brings the LOP panel data to bear on the question of the stability of beliefs at the individual level across time on militant and cooperative internationalism and specific policy issues. As Murray points out, previous cross-sectional analyses can illuminate aggregate trends across time but cannot address the stability of individual beliefs. Although previous scholars treated militant and cooperative internationalism as orthogonal dimensions from which four types of belief orientations are created, Murray examines each dimension as an independent attitude construct, which allows her to evaluate the interconnection between the dimension and other factors. These analyses indicate the stability of the militant and cooperative internationalism beliefs despite radically shifting views of the Soviet Union/Russia and containment.

Chapter 4 provides data suggesting that the dimensions of foreign policy beliefs and domestic policy beliefs are substan-

tially connected. Based on this finding, Murray concludes that "both types of beliefs are derived from the same core values and, second, that sets of values coalesce along the liberal-to-conservative continuum." Although she clearly indicates these final conclusions are based upon conjecture that "is consistent with, but cannot be confirmed by, the data" (p. 85), her analysis soon runs into trouble. Although the author at several points indicates that she does not view leaders' beliefs as unidimensional based upon a liberalism/conservatism continuum and that other dimensions are necessary to explain the complicated nature of beliefs (e.g., p. 89), the analysis in the next chapter belies these assertions.

Chapter 5 examines the distribution of policy attitudes largely in reference only to ideological views along the liberalism/conservatism spectrum. Despite assertions to the contrary, the analysis significantly extrapolates from the one dimension in such a manner that it approaches a unidimensional presentation in practice. This tension also points to a lack of clarity in the book regarding the "core values" that Murray asserts are arrayed along a liberalism/conservatism dimension (p. 111). It is not clear from her presentation how these values differ significantly from the ideological orientations used in the analysis.

Even with these shortcomings, Murray makes an important contribution to the scholarly discourse on the stability and structure of elite beliefs. She is also to be commended for the extensive documentation of her research methods in four detailed appendices. Through her imaginative creation of the panel survey, Murray addresses an important question that the previous literature on this subject had failed to address adequately.

Disarming Strangers: Nuclear Diplomacy with North Korea.

By Leon Sigal. Princeton, NJ: Princeton University Press, 1998. 321p. \$29.95.

Daniel Drezner, *University of Colorado at Boulder*

For some, the confrontation between the United States and North Korea over the latter's nuclear weapons program typifies the post-Cold War security environment. A rogue state, hostile to democracy and free markets, acquires the capacity to build nuclear weapons. The United States, as the hegemonic power, must patch together a coalition of allies (South Korea, Japan) and other great powers (Russia, China) and negotiate with a regime that has consistently violated international norms. Approaching the brink of war in June 1994, a last-minute settlement is reached because of the "track II diplomacy" of former president Jimmy Carter. In return for giving up its nuclear ambitions, North Korea will receive proliferation-proof South Korean light-water nuclear reactors. In essence, North Korea acquiesced in return for a \$5-billion carrot, equal to one-quarter of its gross national product.

If this episode is a harbinger of future challenges to U.S. security, then what can be gleaned from it as a guide to policymakers? In *Disarming Strangers*, the main thesis is that the United States and its allies wrongly adopted a "crime and punishment" strategy, relying on coercion to force North Korea to acquiesce. Sigal comes to the opposite conclusion: "Cooperation works. It can succeed where coercion fails. It is also cheap by comparison" (p. 4). Tracing the episode from its origins in early 1991, he tries to demonstrate that North Korea practiced a tit-for-tat strategy. It responded positively to any sign of cooperation but turned bellicose when threatened. This is why the Framework Agreement, which was decried by most policy analysts when it was signed in October

1994, has worked. North Korea has matched every American concession; three years later, the odds of success are much stronger than when it was signed.

If coercion was such an ill-conceived strategy, then why did the United States pursue it for three years? Sigal provides four reasons. First, there was a consensus among policy elites in the United States that any compromise would be an act of appeasement. Their "shared images" of nuclear diplomacy dictated that, when dealing with rogue states, the stick was better than the carrot. Compromise was a tough political sell. Second, the International Atomic Energy Agency (IAEA), burned by previous lapses in Iraq, was determined to make an example of North Korea. It wanted total compliance and rejected any hint of compromise. Third, South Korea was a substantial brake on any kind of rapprochement with the North. Surprisingly, this was not due to national security but to domestic politics. President Kim Young Sam needed the support of hardliners to stay in power in South Korea. Kim also felt he needed to distance himself from the leader of the opposition, Kim Dae Jung, who preferred a more accommodating strategy. Fourth, there was a lack of consensus among U.S. bureaucracies over the best course of action. Those that opposed a deal, such as the CIA, made life more difficult for the negotiators by leaking intelligence estimates that grossly inflated the North Korean threat.

Within this context, the United States had precious little wiggle room. A diplomatic solution lacked a powerful backer within the Clinton administration. When compromise was proposed, it rankled the IAEA, scared the South Korean regime, and ran into a buzzsaw of vitriolic op-eds and congressional belligerence. Faced with these constraints, it is not surprising that the United States spent three years threatening economic sanctions and refusing to compromise its demand of unfettered access to all North Korean nuclear installations.

Michael Mazarr's (1995) *North Korea and the Bomb* and Don Oberdorfer's (1997) *The Two Koreas* are two other recent books about the crisis with North Korea. *Disarming Strangers* is better than either of these books in describing the bureaucratic and political environments in Seoul and Washington that contributed to such a belligerent strategy. Another plus is Sigal's description of the nongovernmental organizations and academics that developed more contacts with the North Korean regime than the U.S. government possessed. In this context, it is not surprising that Carter was able to meet with Kim II Sung and secure an agreement, while U.S. negotiators were hamstrung with political constraints and a lack of knowledge about North Korea.

In other ways, however, Sigal's book is more flawed than Mazarr's or Oberdorfer's. *Disarming Strangers* gets some facts wrong and omits others of crucial importance. Sigal argues that, in the past, inducements and reassurances were responsible for stopping nuclear weapons programs in several other states, including South Korea and Taiwan (p. 4). This is a gross exaggeration; a look at those two cases shows that it was economic coercion, not economic inducements, that worked. In the North Korean case, there is credible evidence that the threat of coercion contributed more to compliance than Sigal would care to admit. North Korea's initial friendliness on this issue in 1991 was as much a product of Chinese pressure as American inducements. History repeated itself in 1994. Oberdorfer notes that in June 1994, China told North Korea it could not veto U.N. sanctions and strongly recommended reaching an agreement with the United States. This threat helps to explain Pyongyang's willingness to cut a deal with Carter. Sigal also castigates the United States for demanding a complete account of North Korea's nuclear past and being

so inflexible in its demands. What he fails to mention is that the Nuclear Non-Proliferation Treaty (NPT) was up for renewal in 1995. Renewal was an important goal of the Clinton administration and affected negotiations with North Korea. To weaken the norm of total compliance with the NPT just before renewal would have made it very difficult for the United States to maintain the strong norm against nonproliferation.

In addition to these empirical weaknesses, *Disarming Strangers* suffers from some theoretical confusion. A tit-for-tat strategy has two crucial components: cooperation with "nice" players and the quick punishment of actors who defect. Sigal completely ignores the second aspect, which is a shame, since it also helps explain U.S. strategy. North

Korea's first defection, reprocessing its spent fuel, triggered U.S. attention. The second North Korean defection, failure to comply with either the Safeguards Agreement or its agreements with South Korea, escalated the crisis and initiated the U.S. push for sanctions. A key aim of *Disarming Strangers* is to describe how the United States erred in not pursuing a tit-for-tat strategy. But the act of negotiating while preparing a credible threat in case of defection is the epitome of tit-for-tat.

With *Disarming Strangers*, Sigal provides an excellent account of how domestic politics and alliance dynamics can affect crisis bargaining. As a guide to scholars and policymakers of how to avoid such confrontations, it leaves much to be desired.

Fiscal Policy Outcomes and Electoral Accountability in American States

ROBERT C. LOWRY *Michigan State University*

KAREN E. FERREE *Harvard University*

Clear fiscal policy effects appear in American state gubernatorial and legislative elections between 1968 and 1992, independent of the effects of incumbency, coattails, term limits, and macroeconomic conditions. The results show that accountability is generally stronger following a period of unified party control than under divided government. Voter reactions to taxes and spending relative to the state economy are conditional on expectations, which differ for each party. Net of these expectations, Republican gubernatorial candidates lose votes if their party is responsible for unanticipated increases in the size of the state budget; Democrats do not and, indeed, may be rewarded for small increases. Independent of this, the incumbent governor's party is punished in legislative elections for failing to maintain fiscal balance. Taken together, these results show how electoral accountability for fiscal policy outcomes is strong but highly contingent on a complex configuration of party labels, partisan control, expectations, and institutions.

Despite the attention given to big government and budget deficits during recent political campaigns, the connection between fiscal policy outcomes and election results in the American states is not well understood. Some studies indicate that gubernatorial elections are influenced by changes in taxes and spending, and others suggest that voters rightly expect Democratic politicians to tax and spend more than Republicans, but there is almost no empirical work on whether voter reactions to fiscal policy are contingent on which party is in power. Moreover, no study has asked whether voter reactions to fiscal policy outcomes are contingent on partisan control of both the executive and legislative branches, or systematically examined voter reactions to budget surpluses and deficits per se, or investigated the effects of fiscal policy outcomes on state legislative elections.

We estimate models of retrospective voting in American state elections to determine whether voters respond to fiscal policy outcomes and how their responses depend on their expectations and ability to assign responsibility for outcomes to specific officeholders. Our data encompass gubernatorial and legislative races from 1968 to 1992 in 41 states with similar electoral cycles. In order to determine the independent effects of fiscal policy outcomes on election results, we control for many relevant political and economic factors identified in previous studies. Throughout, we also ask how two institutional factors affect accountability.

First, are voter responses stronger under unified government than divided government? Does divided government dilute accountability? Second, does collective action dilute accountability, that is, are the results stronger in gubernatorial than legislative elections?

We find evidence that politicians are more likely to be held accountable following a period of unified party control. Electoral penalties for choices voters dislike are less evident after periods of divided government. With regard to collective action, the answer is less clear. All in all, accountability may be stronger in gubernatorial than legislative elections, but the effects of fiscal policy are evident in both. Altogether, our results demonstrate that the extent to which voters hold elected officials responsible for fiscal policy outcomes depends on party labels, patterns of partisan control, expectations, and institutions.

Our results also suggest that voters respond to two different aspects of fiscal policy: *scale*, the size of state revenues and spending relative to the state economy, and *balance*, the size of the current surplus or deficit in the state budget. Fiscal scale appears more important in gubernatorial elections, but voter reactions to fiscal imbalance appear in legislative contests. We find evidence that voters dislike both budget deficits and surpluses. Moreover, voters hold politicians accountable for changes in fiscal scale in a *partisan* way: They punish Republican incumbents and reward Democrats for unexpected increases in fiscal scale, but they reward Republicans and penalize Democrats for unexpected cuts.

In the next section, we briefly summarize the literature on fiscal performance and state elections. Then we describe our model of voter expectations and how voter reactions to fiscal performance depend on the incumbent partisan configuration. We lay out specific expectations to be tested with the data. Following that, we describe our data set and the measures used in our empirical analysis and present the estimation results. Finally, we relate our findings to theory, previous studies, and such recent trends as the growth of public spending and divided government.

PARTIES, POLICY OUTCOMES, AND ELECTIONS IN THE AMERICAN STATES

Recent research supports several propositions important to our analysis. First, fiscal policy depends on which party controls the state government and whether the incumbent governor is eligible for reelection. For example, Alt and Lowry (1994) find that the implicit long-run targets for spending and revenues as shares of personal income are higher for (nonsouthern) unified governments led by Democrats than by Republicans, with divided governments falling in between. According to Besley and Case (1995a), state taxes and spending are higher under Democratic governors and higher still if an incumbent Democrat is ineligible for reelection because of term limits.

Second, in state elections, Chubb (1988), Kone and Winters (1993), Niemi, Stanley, and Vogel (1995), and Peltzman (1987) all find that the party of the president benefits from growth in *national* income; less consensus exists about *state* economic conditions. Chubb found state income growth to have marginal effects on gubernatorial races and none on state legislature elections. By contrast, Niemi, Stanley, and Vogel's exit poll data from 34 gubernatorial races in 1986 show that voters reward candidates of the incumbent governor's party for increases in state per capita disposable income. Besley and Case (1995b) find that governors of states with better economic performance than neighboring states are more likely to be reelected. Finally, Carsey and Wright (1998) find that in gubernatorial elections voters' subjective evaluations of the state economy have greater influence than their evaluations of the national economy.

Third, many studies connect elections and state taxes. Niemi, Stanley, and Vogel (1995) find that voters punish the incumbent party's candidate for past increases in state taxes; Kone and Winters (1993) reveal that a candidate of the incumbent governor's party is punished for increasing taxes but not rewarded for decreasing them. Besley and Case (1995b) find that governors who raise taxes less than in neighboring states are more likely to be reelected.

Fourth, Peltzman's (1992) study of presidential senatorial, and gubernatorial elections finds that voters are "fiscal conservatives." Consistent with previous research (Peltzman 1987), candidates from the incumbent party are punished for increases in spending, holding macroeconomic conditions constant. Equations that include changes in both spending and revenue show that voter reactions are concentrated on changes in spending. Peltzman interprets this to mean that deficit financing does not matter politically: Voters punish spending increases regardless of whether they are financed by taxes or borrowing. He admits to being puzzled as to why public sector spending continued to rise throughout the nearly four decades covered by his data despite voter opposition.¹

With the exception of Peltzman (1992), researchers

have not tested whether voter reactions to fiscal policy outcomes are contingent on which party controls the government. Most of Peltzman's results are not party specific, but at the state level he finds that only Democratic candidates for governor are punished for increases in state spending. If that is the case, then it is hard to understand how Democrats have remained electorally competitive in an era of fiscal expansion.

Finally, very little systematic research exists on fiscal policy outcomes and state legislative elections. Only Chubb (1988) studies legislative elections, and he does not include any measures of fiscal policy outcomes in his equations.

TESTABLE PROPOSITIONS

We introduce several innovations. First, we consider voter response to fiscal outcomes in both gubernatorial and legislative elections. Second, we distinguish between fiscal scale and fiscal balance, that is, aggregate public revenues and spending and the difference between them, and deal simultaneously with voter response to both. Third, we propose a model of fiscal scale that is more sophisticated than prior ones and, as a result, resolves Peltzman's empirical puzzle of why spending grows if voters are fiscal conservatives. Finally, we explore how institutional factors, such as divided government and diluted accountability in the legislature, affect voter response to scale and balance. In total, we argue that voter reactions to fiscal policy do not depend simply on whether spending increased or even which party was in control when it did. Rather, the critical factors include whether a single party had control of both branches of government and whether outcomes deviated from expectations. Looking at voter response to fiscal policy in this way allows us to go beyond the results and puzzles of previous studies.

Below, we describe four specific conjectures regarding fiscal scale, fiscal balance, divided government, and legislative accountability. In the remaining sections of the article, we test these conjectures with data from gubernatorial and legislative elections.

A Partisan Model of Voting on Fiscal Scale

Prior models of fiscal scale have been fairly simple: A dependent variable measuring vote or seat share is regressed on a handful of political and economic control variables (e.g., incumbency, state income growth), along with a variable measuring change in expenditures or revenues. Peltzman (1992) included a variable for the governor's political party. As noted earlier, this produced the incongruous result that Democratic governors are punished more than Republican governors for spending increases. We extend previous models in a number of ways.

First, we assume that voters have varying preferences regarding fiscal outcomes and, other things equal, choose to vote for a Democrat or Republican accord-

¹ Peltzman (1992, 359–60) offers two explanations: Voter reactions to increased spending are unlikely to overcome the incumbency advantage, and in the 1950s and 1960s politicians believed that

spending programs would be rewarded by voters and only recently have learned otherwise.

ing to these preferences. The tacit assumption is that Democratic and Republican politicians pursue different fiscal policies, with the latter generally favoring fiscal restraint. This builds on an extensive comparative literature on economic voting (see Alesina, Roubini, and Cohen 1997; Keech 1995; and Nannestad and Paldam 1995) by extending the usual partisan theory assumption, so that parties differ with respect to instruments (taxing, spending) rather than outcomes (unemployment, inflation).

Second, voters form party-specific expectations about fiscal performance: They believe Democrats will raise more revenues and spend more money than Republicans (Baumer and Gold 1995). Among the 10,545 respondents in the NES file, 68% place Democrats higher than Republicans on the seven-point scale describing how the parties stand on "government services and spending," while 18% award both parties the same score, and 14% place Republicans higher than Democrats (Miller and the National Election Studies 1998).² We sought a method for modeling such expectations that would minimize demands on voter information and allow expectations about parties to differ across place and time. Therefore, we modeled them as a function of the performance of the last previous administration with a governor from the same party as the current one. Where possible, we checked the robustness of the results based on this model against those produced by others.

Third, when voters evaluate the performance of incumbent governments, they react most strongly to fiscal "surprises," or how far fiscal policy at the time of the election differs from what voters expected it to be, based on which party is incumbent. Thus, unlike Peltzman, we believe that high levels of spending may or may not invoke voter sanction, depending on which party is in office and its previous levels of spending.

Fourth, voters may punish deviations from expectations even to the point of choosing more of "the hair of the dog that bit them," that is, replacing a high-spending Republican with a Democrat expected to spend at least as much or more. On the surface such voting may appear puzzling, but Austen-Smith and Banks (1989), building on Ferejohn (1986), show that when there is incomplete information, incumbents have incentives to keep their promises only when there is some positive probability that voters will punish any undesired past performance. Thus, at least under some circumstances, rational Republican (Democratic) voters should be prepared to vote against incumbents of their own party because of fiscal increases (contractions).

Finally, in order to deal with an "instrument problem" of possible reverse causation (does fiscal policy affect elections, or do incumbents in danger of losing or not running for reelection spend more?), we follow Besley and Case (1995a) and control for gubernatorial

elections that take place under binding term limits. While this is an imperfect instrument, it isolates many cases of behavior by incumbent governors who do not expect to be around after the next election.

Whereas Peltzman suggests that voters are all fiscal conservatives, we allow them to have varying preferences about fiscal outcomes. Furthermore, previous authors see voters as reacting uniformly to all increases in spending, but we contend that they respond most strongly to deviations from party-specific expectations following periods of unified party control. Finally, we attempt to deal with an important reverse causality problem ignored by all previous researchers except Besley and Case. While our model is considerably more complex than previous work, we believe our additions are warranted and may help resolve the puzzle of persistent growth in government despite apparent voter opposition.

To sum up, we test whether the data are consistent with the following proposition about partisan retrospective voting.

PROPOSITION 1. *Voters react to the difference between observed performance and party-specific expectations about fiscal scale, allowing for whether the incumbent governor is ineligible for reelection.*

Furthermore, we expect that this will hold independent of the effects of fiscal balance on voting.

Voting on Fiscal Balance

The effects of budget surpluses and deficits per se on election outcomes depend on both voter preferences and the extent to which voters can determine whether their preferences are being satisfied. Economic theory provides no unambiguous expectations about voter preferences regarding deficits. According to Ricardian equivalence theory, voters will be indifferent between taxes and government borrowing if they discount the future at the same rate as financial markets (see Barro 1974). Yet, myopic and self-interested voters may reward incumbents who run deficits and punish incumbents who run surpluses, since a deficit means that the costs of current benefits are being imposed on future generations (Alesina and Perotti 1995). Alternatively, voters may punish incumbents for running deficits but reward surpluses, at least as long as surpluses are used to retire past debt.³ Finally, voters may punish incumbents for both deficits and surpluses if they view failure to maintain a balanced budget as a sign of fiscal mismanagement. While theory is agnostic, we hypothesize that voters expect elected officials to maintain fiscal balance on an annual basis as well as over time. This implies that voters punish incumbents for both deficits and surpluses.

Do voters react to deficits in party-specific ways, as we argued for fiscal scale? Some interpretations of party ideology attribute different attitudes about budget balance to Democrats and Republicans (Keech

² The latter percentage falls to 12% if we restrict the sample to voters. While either figure may seem high, each is less than half the 30% of ANES respondents who did not know which party controlled the House of Representatives either before or after the election.

³ Our data on expenditures include interest payments on general debt but not retirement of debt.

1995), but research on the U.S. federal budget and comparative studies of OECD countries reveal no systematic link between leftist or rightist parties and the frequency or size of deficits (Alesina, Roubini, and Cohen 1997). Work on state public finances also finds no systematic differences (Poterba 1996). Although the rate at which deficits occur in our data is lower for unified Republican government than for other partisan configurations, the differences are not significant at conventional levels according to a χ^2 test.⁴ Therefore, we do not expect to find systematic differences in voter reactions to fiscal balance based on party, although our empirical model would not prevent their discovery.

PROPOSITION 2. *Net of the expectation that incumbents of both parties will provide fiscal balance, voters react negatively to both surpluses and deficits, whichever party is in office.*

Again, we expect that this will hold independent of the effects of fiscal scale. We also considered whether voter reactions might be stronger in states with a balanced budget law, but, as reported below, we did not find significant effects.

Unified Party Government and Responsibility for Outcomes

Previous studies of fiscal policy outcomes and state elections examine only the race for governor, without reference to partisan control of the legislature. Yet, recent work on economic voting (Anderson 1995; Powell and Whitten 1993) shows that the greater the "clarity of responsibility"⁵ in a government, the more likely it is to be held accountable (rewarded or punished) for economic performance. While these studies mainly consider parliamentary coalitions, their insights can be extended to state governments. Because it is possible for opposite parties to control the different branches of state government, we expect that clarity of responsibility will be highest under unified control. Therefore, we anticipate that voters are more likely to hold candidates from one party responsible for fiscal policy when that party controls both branches of government. For both fiscal scale and balance, we argue that divided government has real electoral consequences.

PROPOSITION 3. *Voter reactions to fiscal policy outcomes are stronger if the same party controls both the executive and legislative branches of state government prior to the election.*

⁴ Our data set includes 84 (28) cases of unified Democratic (Republican) state government and 56 (65) cases of divided government, that is, a Democratic (Republican) governor faces a legislature controlled by the opposite party. There are 35 (9) cases of deficits under unified Democrats (Republicans), and 25 (32) cases of deficits under a Democratic (Republican) governor heading a divided government.

⁵ Powell and Whitten (1993, 398) define "clarity of responsibility" as "the degree of perceived unified control of policymaking by the incumbent government."

Uncertainty Due to Collective Responsibility

In addition to the effects of divided government, voters in legislative elections face the problem of assigning credit or blame for collective actions (Austen-Smith and Banks 1989). Individual legislators may be able to avoid blame for bad outcomes, even when their party controls both branches of government. Conversely, they may try to claim credit for good outcomes in which they played no role (Fiorina 1989). Chubb (1988) found that macroeconomic outcomes have less effect on legislative elections than on gubernatorial elections, and Peltzman (1992, 343) found that the effects of federal spending growth were smaller for U.S. Senate candidates than for presidential candidates. We expect that the same result holds for state fiscal policy.

PROPOSITION 4. *Voters do not react to state fiscal policy outcomes as strongly in state legislative elections as in gubernatorial elections.*

MODEL SPECIFICATION AND DATA

We study elections for governor and the lower house of the legislature from 1968 through 1992 in 41 states that have four-year gubernatorial and two-year legislative cycles.⁶ Appendix A provides a listing of the states and years in our data set. In our generic specification, *Democratic Party Support* is related to state-specific fixed effects. Other explanatory variables vary over space and time and include the effects of incumbency, term limits, political coattails, macroeconomic performance (interacted with incumbent partisan control), and fiscal policy outcomes (also interacted with incumbent partisan control).

Dependent Variables

For gubernatorial elections, the dependent variable is *Dem. Pct. Votes for Governor*, that is, votes received by the Democratic candidate as a percentage of all votes cast for major party candidates (Scammon and McGilivray 1995). For legislative equations, we use *Dem. Pct. Legislative Seats*, or the number of seats won by Democrats in the lower chamber of the state legislature as a percentage of all seats won by Democrats and Republicans (U.S. Department of Commerce, various years). To compare coefficients in gubernatorial and legislative elections, we estimate alternative legislative models using the statewide votes received by Democratic candidates as a percentage of major party votes for 1970–89, since the data are available only for this period.⁷ In Appendix B we report any differences in the

⁶ Alabama, Mississippi, and Maryland are omitted because they have four-year legislative terms. New Hampshire, Rhode Island, and Vermont are omitted because they have two-year gubernatorial terms. We also omit Nebraska, which has a unicameral legislature with nonpartisan elections; Louisiana, which has a unique open primary/runoff system; and Alaska, where state revenues depend heavily on severance taxes and exhibit very large annual swings.

⁷ The percentage of seats won may not be a linear measure of voter preferences, due to the "votes-seats" curve in each state (Gelman and King 1994). Data on votes were obtained from the Inter-

results that depend on whether we used the percentages of seats or statewide votes. In each case, the dependent variable is the untransformed percentage of votes or seats won by Democrats.⁸

Political Control Variables

To determine the independent effects of fiscal policy outcomes on elections, we control for certain political variables.

Fixed Effects. We use a different intercept for each state. This captures differences in vote outcomes due to state-specific factors, including differences in average (long-term) partisan support among the state electorates.

Incumbency Advantage. We include a dummy variable for *Incumbent Candidate* for governor (the individual, not the party). Incumbency is coded 1 for Democrat and -1 for Republican to capture the expected direction of effects on the dependent variable, Democratic vote share. The legislative equation includes the *lagged percentage of seats* captured by Democrats in the state legislature.⁹

Term Limit Effects. We follow Besley and Case (1995a) by including separate dummy variables for *Term Limited Democrat* and *Term Limited Republican* incumbents in our gubernatorial equation. See Council of State Governments (various years) for states having gubernatorial term limits.

Coattail Effects. Results in lower level elections may be affected by increased turnout and party voting due to concurrent elections for higher office (Chubb 1988). We measure coattail effects by the Democrats' percentage of major party votes for president and U.S. Senate, respectively, *Dem. Pct. Votes for President* and *Dem. Pct. Votes for U.S. Senate*, plus dummy variables for presidential and senatorial election years to capture intercept shifts. We also include gubernatorial coattail effects in equations for concurrent legislative elections.¹⁰

University Consortium for Political and Social Research (1992). This data set covers state legislative elections from 1968 through 1989. Data for 1968 and 1969 were used to create an independent variable for lagged vote share.

⁸ An alternative would be to use a log-odds transformation, but the untransformed share makes the coefficients much easier to interpret, and the vast majority of our observations lie between 30% and 70%, so distortions due to our linear specifications are minimal. Chubb (1988) and Peltzman (1992) both eliminate one-sided elections from their data. Such elections are likely due to the absence of quality challengers, which is itself a sign of satisfaction with past performance.

⁹ Chubb (1988) and Peltzman (1987, 1992) use lagged dependent variables (or their instruments) in the gubernatorial equations. In most variations of our gubernatorial equations, including a lagged vote-share variable produced an insignificant coefficient and did not change our qualitative interpretations. Therefore, we omitted it from our reported models.

¹⁰ Chubb (1988) includes gubernatorial coattails in his legislative equation only for years in which there is no presidential election. We tested the assumption that gubernatorial coattails depend on whether there is a presidential election. While the point estimate of

Macroeconomic Performance

We measure the effects of relative economic performance by *Relative Income Growth*, the percentage change in real per-capita state personal income over two years ending with the election year, minus the equivalent change in national personal income.¹¹ We do not believe voters know the exact growth rates of national and state real per-capita income, but they may have a feeling about how their state is doing relative to what they hear about the nation as a whole. Credit for income growth is assumed to go to the governor's party, and separate growth variables are included for each party.

State Fiscal Policy Outcomes, Voter Expectations, and Party Configurations

The state fiscal policy outcomes we examine are deviations from expected state revenues and spending (scale) and surpluses and deficits (balance). Revenues are measured by general revenues minus federal transfers, while spending is measured by general expenditures. The difference between "total" and "general" revenues or spending includes amounts for state-owned liquor stores, utility companies, and insurance trusts. We subtract federal transfers from general revenues in the belief that voters react to changes in revenues generated by state taxes and fees.¹² For consistency across variables, we measure fiscal scale by taking the ratios of revenues and spending to state personal income averaged over the election year and the year before.

Voter Expectations

We model voter expectations of fiscal policy in a newly elected administration as the observed performance of the last previous administration with a governor from the same party as the current one.¹³ We calculate expectations for both fiscal scale variables (*Expected*

the coattail variable is greater in nonpresidential years, the *t*-ratio for the difference is less than 1.

¹¹ This gave clearer results than either including the state and national components separately or ignoring the national component. When we include separate variables for national and state income growth interacted with party control, coefficients on the national income growth variable are insignificant or perversely negative. Multicollinearity between the average performance of neighboring states and the national growth rate precludes finding any effect of differences in performance between a state and its neighbors. We also experimented with including changes in the state unemployment rate, but our results regarding the effects of fiscal policy were unaffected.

¹² Removing federal transfers from revenues does not mean that we treat voters as being highly sophisticated. Rather, we treat voters as reacting specifically to the amounts taken from their incomes in state taxes. In a way, federal transfers are the opposite of state revenues: An increase in federal transfers feels more like a windfall than an added tax cost, since the money can be interpreted as coming largely from taxpayers in other states.

¹³ On the whole, last incumbency produced more accurate expectations of fiscal scale than did an alternative model using data from all years since 1949 with a governor from the same party. Across revenues and spending for unified party government, the standard deviations of the unexpected components of fiscal scale were be-

Revenues and *Expected Spending*), as well as that part of spending and revenue that is not accounted for by past level (*Unexpected Revenues* and *Unexpected Spending*). Neither theory nor data give us strong reasons for believing that expectations based on past performance matter for fiscal balance.¹⁴ Instead, we assume that voters expect the fiscal year budget to be in balance.

We use separate variables, *Surplus* and *Deficit*, to measure fiscal balance. We create these by subtracting real per-capita general spending from real per-capita general revenues for the year of and the year prior to the election. We then calculate the ratio of this difference to state personal income in each year as well as the average of the two ratios. Finally, we create separate variables for surpluses, coded as zero or positive, and deficits, coded as zero or negative.

Except where noted, each of the four partisan configuration dummy variables (*Unified Democrats*, *Unified Republicans*, *Divided Government/Democratic Governor*, *Divided Government/Republican Governor*) is interacted with both of the balance variables and a variety of scale variables, described in the next section. Divided government is coded according to the party of the governor to facilitate analyzing the effects of coattails in the legislative equations.

Table 1 reports summary statistics for gubernatorial election years in our data set. Eleven elections are omitted during 1968–90 because there were no previous administrations with the same gubernatorial party since 1949 to provide data for expectations. (See Appendix A.) Using the last incumbency model, both expected revenues and spending are about 20% larger under unified, nonsouthern Democrats than unified Republicans (the *t*-statistics for the difference exceed 2.2), with southern Democrats and divided government in between. Both parties have produced unanticipated increases in scale on average.

Estimation

Equations for gubernatorial and legislative elections occurring at the same time (“on-year” elections) were estimated using three-stage least squares (3SLS), with gubernatorial coattails in the legislative equation as the endogenous explanatory variable.¹⁵ Since omitted variables would induce correlations between errors of both equations (in practice, these correlations had magnitudes up to 0.1), 3SLS was preferable to two-stage least squares. Midterm legislative election results are from a separate ordinary-least-squares regression.

tween 5% and 10% smaller for last incumbency as compared to all past years since 1949.

¹⁴ When we estimated models including expected fiscal balance (calculated analogously to expected scale) and distinguished between unexpected deficits and unexpected surpluses, the additional terms were not jointly significant in the regression, and the pattern of our other results did not change.

¹⁵ We assume that the systematic component of elections for president and U.S. Senate depends on factors that are independent of the variables included in our equations, so those coattail effects need not be measured using instrumental variables.

Fiscal Balance	233	0.33	0.80

Note: Data are for gubernatorial election years in states shown in Appendix A. The Democratic percentage of votes refers to the share of votes cast for major party candidates.

Relative income growth is the difference between the percentage change in state and national real per-capita personal income for the election year and the preceding year. Revenues are general revenues minus federal transfers as a percentage of state personal income, averaged over the election year and the preceding year. Spending and fiscal balance are based on general revenues and general expenditures as a percentage of state personal income, averaged over the election year and the preceding year.

Differences (standard errors) between nonsouthern, unified Democrats and unified Republicans are 1.71 (0.54) for mean expected revenues and 1.81 (0.80) for mean expected spending. Southern states in our data set include AR, FL, GA, KY, NC, OK, SC, TN, TX, VA, WV.

EMPIRICAL TESTS

Due to the complexity of our hypotheses, we started with a comprehensive model and used specification tests to eliminate variables, rather than introduce a simple model and progressively add to it. This method helped us identify interactions that otherwise might not have been revealed. In particular, we find that electoral accountability for fiscal policy outcomes is evident but highly contingent on an elaborate pattern of partisan configurations and expectations.

As a first step, we modeled Democratic vote or seat share as a linear function of fixed effects, political control variables, macroeconomic outcomes, and a total of 24 fiscal policy coefficients: six fiscal policy variables (expected and unexpected revenues, expected and unexpected spending, surpluses, and deficits) interacted with four partisan configuration variables. Joint hypotheses tests comparing this model with reduced ones disclosed several results for gubernatorial election years. First, all balance terms (eight total) can be eliminated from the gubernatorial equation. Second, all scale terms (sixteen total) can be eliminated from the on-year legislative equation. Third, all scale terms involving divided governments or expected spending or revenues can be pooled into just three:

Divided government (coded 1 for a Democratic governor and -1 for a Republican governor) times the sum of unexpected spending and revenues; unified government times the sum of expected spending and revenues; and divided government times the sum of expected spending and revenues. The first and second results suggest that voters punish legislatures for imbalance, but they punish governors for unexpected changes in scale. The third result suggests that voters treat Democratic and Republican governors differently when government is unified but the same when it is divided. These purely empirical results provide interesting twists to our expectations about the role of fiscal scale and balance in state elections.

In the interest of space, we do not include a results table for our initial model of on-year elections.¹⁶ Instead, in the next sections we present and describe the main findings of the reduced model and review the specification tests we used to arrive at it. We also discuss the magnitude of the effects relative to electoral margins and midterm election results. We then use simulations to explore a key nonlinearity, that Democratic governors appear to be rewarded for small unanticipated fiscal scale increases while being punished for cuts and large increases. Finally, we review our conjectures about the effects of divided government and collective action, and we evaluate the robustness of the results.

Linear Model

Table 2 presents the results of the reduced linear model. The coefficients measure the marginal effect of each explanatory variable on the Democratic share of the major party vote for gubernatorial elections, or the corresponding share of seats for legislative elections. Fixed state effects and intercept shifts for presidential and Senate election years were estimated but are not shown. A high degree of multicollinearity between expenditures and revenues makes it impossible to disentangle satisfactorily all the individual effects of spending and taxes (see our discussion of robustness in Appendix B). Although we estimate separate coefficients for unexpected revenues and spending in our gubernatorial model and for all scale terms in our midterm legislative model, we show the effects of a unit increase in *both* revenues and spending in Table 2 to emphasize results that proved qualitatively stable across respecifications.

Political Controls. Incumbency effects (incumbent candidate, term limits, lagged seats) generally are significant. Candidates of each party running to succeed an incumbent from their own party do worse if the incumbent was term limited rather than retired for other reasons. An incumbent candidate of either party benefits by about twice as much (7.67%) as the incumbent party candidate who follows a term-limited gov-

ernor loses (2.81–3.76%). Lagged seat share in the legislative equations has a large, significant effect. Presidential coattails are significant in the legislative equations, with Democrats gaining about one-third of a percent more seats for each Democratic percentage point of the presidential vote. We find no effects for U.S. Senate coattails in either on-year equation, although it has significant effects in the midterm elections for the state house, when the U.S. Senate race may be the only “statewide” contest. Governors have long coattails in on-year elections, with a magnitude of effect similar to that of the president. Apart from our estimate of presidential coattails in gubernatorial equations (still positive, but smaller and statistically insignificant), these results reinforce and extend Chubb’s (1988) findings based on 1940–82.¹⁷ The pattern of these results appears whether we include fiscal scale, balance, or both, regardless of how expectations are specified, and across several different estimation techniques.

Economic Variables. The coefficients of the macroeconomic variables (state income growth relative to national, separately by party of the governor) have the expected signs. In the gubernatorial equation, Democratic candidates get a vote share boost of .31 for each percentage point of relative state growth under Democrats, and they do worse ($-.44$ per point) when there has been growth under a Republican governor. The coefficients are each more than twice their standard errors. Almost regardless of specification, across many variations, the significant income effect for Democratic gubernatorial candidates and a more variable but always beneficial effect for Republicans hold. By contrast, the income effects in state legislative contests are inconsistent.

Scale. The estimates in Table 2 reveal a number of important insights. First, voters indeed appear to hold the party of the governor responsible for unexpected changes in fiscal scale; second, they do so in a partisan fashion unanticipated by theory; third, the extent to which they do so depends on whether government is divided or unified. If both revenues and spending are 1% of income below (above) expectations, then a Republican candidate for governor gains (loses) more than 4.5 percentage points of the vote following a period of unified Republican control. The opposite is true for Democrats, who gain just over one percentage point from surprise increases (although this is not statistically significant).¹⁸ In contrast, the coefficient on

¹⁶ Data and documentation verifying all estimation results, redefinitions, or respecifications mentioned but not presented here are available from the authors upon request.

¹⁷ If we omit expectations and add the cases for which we lack data on a prior administration by the same party, the effect of presidential coattails in the gubernatorial equation increases fourfold.

¹⁸ Individual spending and revenue coefficients (not shown in Table 2) follow a similar pattern but are less stable across the redefinitions and respecifications described in the section on robustness, below. For the model presented in Table 2, the coefficient (standard error) for unified Democrats $\times$ unexpected revenues is 2.50 (1.09); for unified Democrats $\times$ unexpected spending it is -1.47 (0.72). The sum of the two coefficients, 1.03, and joint standard error (0.84) are presented in Table 2. For unified Republicans the unexpected revenue and spending effects are, respectively, 7.05 (2.58) and -2.50 (1.86).

Note: The dependent variable is the Democratic share of the major party votes for governor or seats in the lower house of the state legislature. Fixed state effects and intercept shifts are not shown. Deficits are coded as negative numbers. For interaction terms that do not specify party, fiscal policy outcomes are multiplied by 1 for a Democratic governor, -1 for a Republican governor. "Joint" effects of fiscal scale refer to the sum of separate coefficients for revenues and spending. The standard error of the sum is the square root of the sum of both coefficient variances and twice the covariance between the two coefficients.

Results for gubernatorial and on-year state house elections were estimated using three-stage least squares with SST v. 2.0. Results for the midterm state house elections were estimated using OLS with SST v. 2.0.

We anticipate that the signs of the coefficients will be negative for term-limited Democratic governor and relative income growth $\times$ Republican governor, positive for all other political and economic controls. We anticipate that the joint effect of unexpected increases in revenues and spending will be negative for unified Democrats, positive for unified Republicans, and zero (or at least weaker) for divided government. In a fully rational model, because expected scale (based on previous incumbents' performance) has been fully discounted into past voting, it would have no further effect on the current election. We simply report the empirical results we find. Anticipated signs for deficits (surpluses) are positive (negative) for unified Democrats, negative (positive) for unified Republicans, and zero (or at least weaker) for divided government.

Standard errors are in parentheses. * $p < .05$, ** $p < .01$, *** $p < .001$; two-tailed test.

divided government is much smaller (and also not statistically significant).

The partisan flavor of these results is unexpected. In our model, partisan differences are encapsulated within the expectations term. We therefore anticipated a similar effect for both unified Democrats and unified Republicans. Instead, the results show strong partisan differences. Empirically, this could reflect many things, including voter uncertainty and learning, changes in the electorate, or even a "partisan" way of looking at fiscal policy, that is, Republicans not only are expected to provide fiscal restraint but also are rewarded when they do so, even after allowing for voters' partisan expectations. Of course, the partisan differences could reflect some deficiency in our measure of expectations. Yet, the basic pattern of the results is robust in virtually all variations in specification we tried.

More important, these results are inconsistent with Peltzman's view of uniform fiscal conservatism among voters. Because voters expect Democrats to provide greater scale, Republicans are punished for surprise increases, whereas Democrats are not. Each extra element in our specification—controlling for term limits, modeling expectations, including both taxes and spending, and considering differences between unified and divided control—facilitates the emergence of this pattern.

Magnitude of Effects. The following scenario illustrates the magnitude of these estimated results. Suppose a unified party government produces unexpected spending and unexpected revenues of at least 2.5% each. (Table 1 shows that this is about one standard deviation greater than the mean for our data set.) All else equal, the coefficients in Table 2 predict that after such an unexpected increase, the gubernatorial candidate of an incumbent Democratic Party will actually

gain about 2.6% (2.5×1.03) of the vote, while an incumbent Republican Party will lose 11.4%. If the incumbent governor is ineligible for reelection, Democrats lose about 1.2%, while Republicans lose about 14.2%. The loss of legislative seats (due to the coattail effect) is predicted to be only 0.4% for Democrats and 5.2% for Republicans. Since the average margin of victory following a period of unified party government in our data set is 7.1% for the gubernatorial election but 17.4% in the legislature,¹⁹ the predicted effect exceeds the average margin only for unified Republicans in the governor's race. Voter reactions to fiscal performance could thus easily contribute to the trend toward divided government documented by Fiorina (1996) and others.

Balance. Problems with multicollinearity are far less severe for fiscal balance (see Appendix B). Therefore, we consider the effects of deficits and surpluses separately. As mentioned above, we obtain the empirical result that fiscal balance does not affect the governor's race directly. Under unified government, however, both Democrats and Republicans lose seats in the state legislature when they run deficits.²⁰ The size of the effect is similar in both cases (a deficit that is 1% of state income costs either party around 5% of seats), but it is statistically significant only for Democrats. Surpluses, in contrast, strike unified Republicans much harder than unified Democrats. Results are generally much weaker under divided government, although Democratic governors with divided control appear to

¹⁹ Average margin of victory is measured as the mean difference between the percentage of votes or seats received by the winning party and 50%.

²⁰ Recall that a negative deficit and a negative coefficient imply a positive effect (Democrats do better) on vote share.

FIGURE 1. Effects of Fiscal Surprises on Gubernatorial Elections

Note: A fiscal scale surprise of size X means that unexpected revenues and unexpected spending are both X percent of state personal income. Solid lines show the predicted effects of fiscal scale surprises on unified Democrats or unified Republicans based on the model in Table 2, but with party-specific scale coefficients for divided government times unexpected revenues or spending, and quadratic terms for all unexpected scale effects. Dashed lines indicate ± 1.96 standard errors. Thus, for a fiscal scale surprise of $+2$ under a unified Democratic administration, the predicted effect on the Democratic candidate for governor is 3.3, with a 95% confidence interval of -0.7 to 7.3 . The figure was created using Gauss v. 3.1.

lose support in the state legislature when there is a deficit.

Specification Tests. As noted above, various specification tests support the results in Table 2. For the gubernatorial equation, no significant improvement is obtained by separating positive and negative surprises for unified governments. It is not significantly improved by further differentiation among the remaining pooled fiscal scale coefficients or by including any group of fiscal balance coefficients. (All remaining coefficients are at least as large as their standard errors.) In contrast, no further subset of fiscal scale coefficients significantly improves the fit of the legislative on-year model in Table 2, and no subset of fiscal balance variables can be excluded without significantly worsening the fit.²¹ Finally, none of the three main groups of variables (unexpected and expected fiscal scale and fiscal balance) can be excluded from the midterm equation.

Midterm Elections. For the midterm equation in Table 2, the last incumbency expectations are the same as for the gubernatorial equation two years following, so the data are limited to 1990 or earlier. Empirical tests show that the parsimonious specification used in the on-year

model results in significant loss of information when applied to midterm elections, so we estimate a full set of 16 scale coefficients and eight balance coefficients.²² For simplicity, we again show the joint effects of revenues and spending. We find that unified Republicans are punished for unexpected increases (but not as severely as in gubernatorial elections), while Democrats are rewarded in the case of divided government. We find similar results for expected fiscal scale. The fiscal balance results are less consistent than in the on-year legislative elections: Neither deficits nor surpluses have a significant effect on unified Democrats, while unified Republicans are punished for surpluses but not deficits. On the whole, current policy does not appear to matter as much in midterm elections, perhaps because these are partly a rerun of the election two years before, and the incumbent administration has not yet been completely evaluated. The divided government results are mixed.

Nonlinear Results and Refinements from Simulations

Are the Effects of Fiscal Scale Increases Uniform? It seems unlikely that governors and parties would be rewarded for surprise cuts and increases of any size. Are there limits? Do voters reward small surprises but

²¹ If the seven fiscal scale variables are excluded from Table 2, column 1, then the resulting F -statistic has $p < .006$. Once they are included, the F -statistic for excluding the eight balance coefficients has $p < .73$. Similar magnitudes (with opposite inferences) obtain in the legislative equation.

²² The model including 24 fiscal coefficients fits significantly better ($p < .01$) than any model omitting one or more groups of our fiscal scale or fiscal balance coefficients.

Results are from 10,000 Monte Carlo simulations performed using Gauss v. 3.1. Simulated shocks assume unexpected revenues and unexpected spending each equal the given percentage of income. punish larger changes? If so, then a nonlinear specification is needed, and the restrictiveness of the linear specification above could explain the insignificant joint results for unified Democrats. We modified the on-year model in Table 2 by adding a full set of quadratic terms for unexpected scale effects and (for divided government) by interacting unexpected spending and revenues with the governor's party. Figure 1 presents the results for fiscal scale shocks on unified incumbent parties in gubernatorial elections. (Note that the vertical axis measures the effect on the incumbent party vote share, not the Democrats' vote share.) It shows that Republican governors who also control the legislature benefit from cuts and lose from increases in a way that remains nearly linear. Conversely, Democratic governors are significantly rewarded for increases up to about 2% of income, beyond which the standard errors increase, and eventually it appears that voters dislike big surprise increases enough to penalize them. Unified Republican governors are punished more than Democrats for surprise increases ranging from about +2% to +4% of income, with symmetric effects (electoral gains) for simulated cuts beyond the range of observed data.

We can gain further insight into the precision of these estimates from simulations based on random draws from a multivariate normal distribution whose first moments are the full set of estimated coefficients

and whose second moments are their variance-covariance matrix. The first two lines of Table 3 give the mean effects for unified parties and their standard errors from 10,000 random draws. For example, a 1% fiscal scale surprise (unanticipated increase of 1% in both revenues and spending) under unified Democrats increases Democratic gubernatorial vote share at the next election by 2.4% on average, with a standard error of 1.4. These results, naturally, strongly resemble the analytic calculations plotted in Figure 1.

We can also use the simulations to answer questions that would be more difficult to answer analytically. For example, how often would a fiscal scale surprise of a given size result in the incumbent party losing votes? As Table 3 shows, the probability that unified Democrats gain (lose) support in the governor's race following unexpected increases (cuts) in fiscal scale of 1% or 2% is .94 or greater, but the probability of their gaining support falls below .5 at surprise increases of +5 and larger. For Republicans the situation is reversed: They are very likely to lose from surprise increases but to gain from unanticipated cuts. Moreover, the difference in how voters treat the parties is even more clearly established: Unified Republicans are nearly certain ($p > .96$) to do worse (better) than Democrats for any increase (cut) of magnitude greater than +1. Moreover, in every specification variation that allows for a "partisan pattern," these qualitative features appear.

Unified and Divided Government. Is this partisan pattern of accountability more clear when control is unified? Does divided government get in the way? We have seen several times that the estimates under divided government are less well determined than for unified government. We can clarify this with simulations using the same quadratic model. Table 3 indicates that the mean changes in governors' vote share under divided government preserve the sign pattern described above: Democratic governors are more likely to lose support from surprise cuts, while Republicans are more likely to lose from increases. The pattern of sizes of effects is stronger for unified than divided government. Moreover, the difference between parties (the extent to which Republican governors are likely to gain or lose support more than Democrats from surprise cuts or increases, respectively) is consistently smaller under divided government.

Governor and Legislature. Our results (scale effects in the gubernatorial equation and balance effects in the legislature, plus scale effects if the governor's coattails are considered) call into question our conjecture that collective action inhibits accountability. The top four rows of Table 4 analyze simulations from the quadratic specification for varying fiscal balance shocks. The main effects of balance all appear: Unified Democrats are punished for both deficits and surpluses, although the effects of surpluses are small. Unified Republicans are punished severely for surpluses and may also be punished for deficits, although significance for deficits is weak. Finally, Democrats lose seats in the legislature following deficits if there is divided government and a Democratic governor.

As the last panel of Table 4 shows, in three of four

cases with unified government (but only one with divided government), the presence of a surplus or deficit leads to vote loss with probability greater than .93. This supports the argument that voters expect fiscal balance, but the support is less clear when the lines of accountability are blurred by divided government, not as a consequence of legislative contests. Analysis with seat share rather than vote share (this restricts data to 1970–89) changes the patterns and strengths of effects but not the pattern of signs. (See Appendix B.)

How Robust Are the Results?

The results for fiscal scale hold up when balance variables are included in the gubernatorial equation, and the effects of balance remain when we include scale terms in the legislative equation. When we exclude balance variables from the model completely, some scale effects appear in the legislative equation (independent of coattails). If we measure scale with only expenditures in the gubernatorial equation, then partisan differences become smaller but do not disappear; and the penalty for unified Republicans running surpluses becomes significant. (See Appendix B.) With few exceptions (noted below), these qualitative results are robust: Net of expectations, Republicans are penalized for surprise increases in scale and for surpluses; Democrats are penalized for deficits and rewarded (to some extent) for increases in fiscal scale.

Moreover, the overall pattern of results (and especially the partisan component) does not depend excessively on our choice of expectations mechanism or our measurement of fiscal policy. In general, because "all past years" expectations are less accurate, standard

errors in models using that formulation are larger.²³ When we omit expectations entirely and just investigate the effects of revenues and spending as income shares, the residual sum of squares for the gubernatorial equation rises by about 7%, but the overall contours of the result remain.²⁴ Similarly, if we investigate two-year percentage changes in revenues and spending without normalizing by income, the partisan pattern in particular shines through. Only when we include expectations *and* measure policy in terms of changes do we get no results. That model, which has voters judge performance in terms of the degree of deviation from the amount of change that might have been expected, is most likely too demanding on voter information. We have also done some replications varying spatial and temporal coverage, using a measure of balance that normalizes the difference between revenues and spending by general spending less federal transfers, and we have explored the extent to which fiscal scale reactions depend on whether economic conditions are good and whether the budget is in surplus or deficit. There is a hint that governors of both parties are more likely to be punished for increased spending when there are deficits, but even so, the overall pattern of results in Table 2 survives.²⁵

One caveat is necessary. In Table 2, where such comparisons are appropriate, the unexpected scale components are more important and better determined than the corresponding expected components. This is consistent with a rational retrospective model in which information is limited. This difference does not hold up in some robustness checks. Indeed, the expected components are more important in midterm elections. Estimated effects of "expected" changes could be consistent with longer voter memories or misspecification of the expectations model.

Finally, to look for effects of fiscal institutions, we interacted the eight balance variables in the legislative equation in Table 2 with a dummy variable indicating the presence of a no-carryover law.²⁶ The legislative seat penalty received by the Democratic Party when Democratic governors run deficits (regardless of which party controls the legislature) is apparently confined to

states with no-carryover laws, but the eight extra coefficients needed to capture this interaction do not jointly improve the fit of the equation significantly ($p < .34$), and estimates based on separate subsamples divided by no-carryover laws fared no better. We also added changes in the rating assigned to a state's 20-year general obligation bonds to our model of scale and balance, since under uncertainty voters may take cues from expert observers, such as bond rating agencies (Goldstein and Woglom 1992), and anecdotal evidence indicates that elected politicians worry about the message sent by a change in bond ratings (Briffault 1996; U.S. General Accounting Office 1993). We did not find any significant results, probably because there are very few cases of rating changes (19 negative and 20 positive ones) in our data.

DISCUSSION

Electoral accountability for fiscal policy outcomes is contingent on patterns of partisan control in several ways. There is evidence that voters react differently to increases in spending and revenues, depending on which party controls the government. We find that Democrats are expected to provide a larger public sector, a factor omitted in the literature, and may even be rewarded for unexpected, moderate increases in fiscal scale under unified Democratic government, with opposite effects for fiscal cuts; the results are symmetrically opposite for Republicans. We find support for the conjecture that accountability for state-level policy is stronger when one party controls the executive and legislative branches. There is also evidence that voters prefer a balanced budget to either deficits or surpluses and that both parties are punished for fiscal imbalance.

Less expected was the finding that fiscal scale variables are more important in gubernatorial elections and fiscal balance in concurrent legislative equations. The bottom line appears to be that voters expect different things from governor and legislature. They expect governors to carry out Democratic and Republican budgets as appropriate, and they penalize the governor's party in the legislature if the budget is mismanaged. After all, the legislature does pass the budget, and under unified control the governor's party bears clear responsibility when the budget does not balance. It is puzzling that the governor seems able to avoid a direct penalty for fiscal imbalance, and our new finding regarding legislative contests deserves further research.

Our results both support and contradict earlier work. We replicate, extend, and qualify the findings of Chubb (1988) and Besley and Case (1995a, 1995b) on coat-tails, incumbency, income effects (at least state-specific ones), and term limits. We have new, party-specific results for fiscal scale that reflect our distinction between parties and a model that includes expectations, controls for term limits, and does not try to separate revenue and spending changes from each other. We also show that while the Powell-Whitten results about diluting accountability resonate with ours, countries such as the United States cannot be coded one way or

²³ For instance, in a close replication using all past years expectations, the fiscal scale effect for unified Republicans is 5.2, with a standard error of 1.4. Qualitatively, inferences are unaffected.

²⁴ Since we cannot find an effect for expectations on fiscal balance, which counts more in the legislative equation, that equation is unaffected. All the main results below are also robust to limited experiments with expectations based on average performance by parties across all states, a means of allowing for voter mobility.

²⁵ Eliminate the South, and the effect of term limits disappears, but the party-based scale and balance coefficients are similar to those in Table 2. Half the cases of unified Republican government are in 1968–74, so eliminating the early years matters to those coefficients and standard errors, but eliminating the last four years, when there was a significant recession, does not alter the results in any important way.

²⁶ Laws limiting the ability to carry deficits into the next fiscal year are stronger than those that merely require politicians to propose or adopt a budget projected to be in balance (Poterba 1996), and states with such laws pay lower interest rates on general obligation bonds (Bayoumi, Goldstein, and Woglom 1994; Eichengreen and Bayoumi 1995; Lowry and Alt 1997).

the other (as they do). Powell and Whitten (1993, 406) classify the United States as a country in which responsibility is relatively clear, but we show that accountability varies over time and is less clear when different branches are controlled by different parties. Our findings imply that any attempt to generalize about accountability from studies based on parliamentary systems is likely to be flawed, given the popularity of separately elected executives in non-OECD democracies (see Jones 1995).

Our results are quite different from those of Peltzman (1992). We find that voters do not uniformly punish all spending increases. They are far more discerning: Their reaction to fiscal outcomes depends on the party in office and their ability to assign responsibility for outcomes. Our results are consistent with the growth in state budgets over the past half century, with the electoral success of Democrats who are rewarded for providing such growth, and with the increase in divided government in the states. Our findings also suggest that partisan differences are more pronounced than earlier studies indicated.

With regard to balance, the main positive theory explanations for deficits are either Ricardian equivalence or collective responsibility problems, with the executive being the one who has an incentive to maintain some kind of balance. Our results seem to say that Ricardian equivalence does not apply, since voters are not indifferent. They like balance, neither net public saving nor deficits. They punish fiscal irresponsibility in a collective way by weakening the governor's party in the legislature, as though desiring to divide government, which in turn could lead to larger deficits (Alt and Lowry 1994). While the results are not as consistent as we would like, they cut against explanations for changes in government debt that rely on selfish or myopic voters (see Alesina and Perotti 1995).

Taken as a whole, this study suggests the outlines of an explanation for the paradox of continued government growth in the face of rational electorates who punish fiscal scale increases. This explanation consists of three parts. First, voters do not punish fiscal excess *per se* but deviation from expected performance. Furthermore, when performance expectations are formed retrospectively, and different parties have tended to pursue different policies in the past, voters are likely to hold varying expectations about future performance. It therefore seems likely that voters will evaluate the same fiscal performance differently according to which party produced it. Democrats are expected to spend more than Republicans and are punished less when they do so. Republicans are expected to work toward smaller government and to return to voters in the form of tax cuts the excess funds that result from cutbacks in government programs. They are punished when spending increases or when surpluses are not returned. One

might speculate that in both cases the voters with stronger expectations of party policy account for the bulk of missing votes or defections, but that issue remains to be investigated. Second, voters punish outcomes only when they are able to establish clear responsibility for them. Consequently, they are more likely to punish unified governments than divided ones. Third, within the subset of unified governments, the executive branch bears the brunt of voter discipline for unexpected changes in fiscal scale.

The above factors can interact over time in ways that result in ever-growing levels of expenditure, despite rational, sophisticated voters who might prefer restraint. Our results suggest that voters most consistently punish one type of political configuration for high levels of spending: unified Republicans. When these administrations increase expenditures in ways that violate voter expectations, voters are placed in a difficult position, for they can only punish such outcomes by not supporting Republicans. Because our dependent variable is the Democratic *share* of major party votes or seats, even abstention by former Republican voters helps Democratic candidates. Thus, despite voter interest in fiscal restraint, expenditure increases.

Of course, one way to mitigate this "hair of the dog" problem is to make an incomplete switch—change the governor but leave the legislature the same—thus creating divided government. Voters may not do this deliberately. Burden and Kimball (1998) argue from evidence on ticket splitting in national elections that divided government is a by-product of lopsided congressional campaigns. We suggest that it may result from differences in the extent to which voters hold different officeholders accountable for particular outcomes. Divided government, in turn, has weaker accountability. Moreover, our results show that in many circumstances candidates for *either* branch are less affected by further fiscal changes if the incumbent government is divided. Then changes in the size of government will not be rewarded or punished by voters until some other factor brings about another period of unified party control. These other factors are outside our model but may be identifiable through further research.

While voters hold politicians responsible for fiscal outcomes, it appears they are more restrained in their tendency to punish than suggested by some earlier studies. Not all increases in expenditure are punished, only those that deviate from expectations and only when clear responsibility can be established. This is likely to be a small subset of cases. Thus, precisely because voters are sophisticated and selective in the way in which they react to fiscal outcomes, many spending increases go unpunished. In the long run, this may result in rising levels of expenditure.

APPENDIX B. FURTHER EVIDENCE ON ROBUSTNESS

Multicollinearity

Multicollinearity could pose problems for our results in two places: between surpluses and unexpected tax increases and between revenues and spending. In reality, the latter is a much larger issue than the former. On average, correlations between deficits or surpluses, on the one hand, and unexpected revenues or spending, on the other, are about .35. In contrast, colinearity of revenues and spending is much greater, which makes it impossible to disentangle satisfactorily individual effects of spending and taxes. For example, when each of the unanticipated and expected revenue and spending components underlying Table 2 is regressed on all other explanatory variables in the gubernatorial election equation, the resulting R^2 values vary from .72 to .98, so the individual coefficient standard errors can become large. For the cases in the equation in Table 2, the simple correlation between general revenues and spending is .97. The correlations between unanticipated revenues and spending vary from .73 to .94 across partisan configurations and are even higher for expected components.

We prefer strategies other than artificially trying to reduce the effect of multicollinearity on the results, and so we did not try to choose between revenues and spending, which could

introduce bias by omitting a relevant variable or including an unwarranted restriction. Hence, we choose to estimate separate effects but describe the effect of a unit increase in both unanticipated revenues and spending. If revenue variables are excluded, then the partisan pattern weakens but does not disappear. For example, the simulation shown in Table 3, including both revenues and spending in the model, yields probabilities that unified Republicans suffer a greater vote share loss in the governor's race after a positive scale shock of 0.92–0.99. Repeated with expenditure variables only, the probabilities fall to 0.68–0.73. This strengthens our belief that omitting revenues is a misspecification of the model and that the distinction we make and employ between scale and balance is valuable.

Legislative Seats and Votes

We estimate the model shown in Table 2 for gubernatorial votes and legislative seats primarily because the seat data are available for a longer period. Whether seats or votes are used as the dependent variable does affect the results for the on-year legislative election, but only partly because of differing numbers of cases. Generally, the results are smaller with votes: The mean change in legislative seats of the governor's party reported in Table 4 is 20% smaller for unified Democrats and two-thirds smaller for unified Republicans, but all coefficients more than twice their standard errors remain so, whichever variable is used. Unlike Table 4, with vote data there are no significant results under divided government.

In contrast to Table 2, neither income nor governors' coattails affect the on-year legislative vote. With seats as the dependent variable, the same 181 cases (that are available with vote data) do produce a significant coattails coefficient. The coattails effect on seats but not votes could mean that a strong gubernatorial candidate willing to stump for legislative candidates is enough to push a few close races over the top but does not have a large overall effect on voting. Similarly, none of the scale or balance results are significant for the midterm legislative elections when we use vote share. The on-year legislative results hold up when we use vote share, so this is a difference between on-year and midterm elections.

Organized Interests and the Decision of Whom to Lobby in Congress

MARIE HOJNACKI *Pennsylvania State University*

DAVID C. KIMBALL *Southern Illinois University at Carbondale*

In a departure from previous research, we focus on the dyadic relationship between lobbyists and committee members in the House of Representatives in order to test hypotheses about what factors shape the decisions of individual groups to lobby individual committee members. Our primary assumption is that organized interests seek to expand their supportive coalitions and affect the content and fate of bills referred to committees. In order to accomplish these goals, they give highest priority to lobbying their legislative allies in committee; allies may lobby other members of Congress on a group's behalf and shape legislation to conform with a group's preferences. But organizations with access to a strong resource base can move beyond their allies and work directly to expand support among undecided committee members and legislative opponents. Our empirical analysis provides evidence to support our expectations.

Organized interests' decisions about whom to lobby in Congress go to the heart of their efforts to influence the legislative process. If opposing or undecided legislators are targeted, then lobbyists can affect overall support for or against a policy proposal (Austen-Smith and Wright 1994; Schattschneider 1975). If mainly allies are targeted, then the influence of lobbying may be more subtle as organizations reinforce the preferences of friendly legislators (Kingdon 1989) and mobilize participation in the legislative process on their behalf (Hall and Wayman 1990). But despite the attention devoted to whom groups lobby, tests of competing hypotheses about why and when specific legislators are targeted have been incomplete. Specifically, previous work has not examined simultaneously the full set of forces purported to shape target choices, a limitation that results from the analytic approaches of these studies.

We use data from a survey of organized interests to examine the dyadic interactions between lobbyists and committee members in the House of Representatives on four issues considered during the 104th Congress (1994–96). Our focus on dyadic relationships allows us to test hypotheses about how the decisions of individual groups to target individual committee members are shaped by a combination of legislator, issue, and organization-specific characteristics. In another depart-

ture from previous research, the hypotheses are rooted in our assumption that groups have two primary legislative goals when a bill is referred to committee: (1) expand the size of their supportive coalition and (2) affect the content and fate of proposed legislation. Our empirical analysis reveals that, other things being equal, organized interests are more likely to lobby their allies in committee than their opponents or undecided members. This tendency is consistent with a group's desire to shape the content of legislation and mobilize legislators to act on its behalf, but not with efforts to counteract lobbying by its organizational opponents. A group moves beyond its allies and lobbies legislators who are not among its usual supporters only when it has strong ties to their legislative district. It then can work directly to build coalitions in Congress in addition to relying on legislative friends.

Our purpose is to integrate three different perspectives on lobbying that have been pursued largely in isolation of one another. One approach uses individual legislators as the unit of analysis and examines characteristics (such as their initial policy preferences and their power in Congress) that determine whether they will be the targets of interest group lobbying. Researchers taking this approach have investigated why organized interests expend effort to lobby legislators who are already inclined to support their interests (e.g., Ainsworth and Sened 1995; Baumgartner and Leech 1996; Denzau and Munger 1986; Hall and Wayman 1990), as well as whether the tendency to lobby allies is a dominant strategy for groups, as suggested by Bauer, Pool, and Dexter (1963) (e.g., Austen-Smith and Wright 1994, 1996; Rothenberg 1992; see also Kollman 1997).

A second approach uses the interest group as the unit of analysis and studies how its resources shape the extent to which it engages in different forms of advocacy. Several scholars have examined how organizational resources (including staff, outside financial support, and an active membership) enhance a group's ability to pursue a successful Washington-based lobbying strategy (Bacheller 1977; Gais and Walker 1991; Schlozman and Tierney 1986; R. Smith 1984). In addition, economic models of interest group behavior often focus on the financial and human resources that

groups devote to influencing government policy (see, e.g., Mitchell and Munger 1991; Olson 1982).

A third perspective examines how issue context shapes the lobbying strategies and effectiveness of interest groups. For example, Bacheller (1977) investigates how lobbying activities vary depending on the public salience of issues and the level of controversy they engender, and Richard Smith (1984) argues that the ability of lobbyists to influence congressional decisions is affected by the amount of time Congress deliberates on an issue.

Each of these vantage points has informed the study of lobbying, but no work has integrated all three perspectives. In a departure from previous studies, our use of the organization-legislator pair as the unit of analysis and our focus on multiple issues allows us to investigate how the choice of lobbying target is affected by interest group resources, legislator characteristics, the interaction of these two sets of forces, and issue context.

Our study also continues a recent effort to examine interest group activity in congressional committees (C. L. Evans 1989; D. Evans 1996; Hall and Wayman 1990; Hansen 1991; Wright 1990). Until recently, most studies of interest group lobbying focused on the floor stage of the legislative process, when the agenda is often fixed or narrow. A bill's content often has been determined by the time a proposal reaches the full chamber, since most of the work of crafting legislation takes place in committees (Smith and Deering 1990), and committee bills frequently go unchallenged on the floor (C.L. Evans 1989; S. Smith 1989). Because of an organized interest's potential to shape the legislative agenda by lobbying in committee, many argue that interest group influence is strongest during this stage of the legislative process (Austen-Smith 1993; Hall and Wayman 1990; Ripley and Franklin 1980; Schlozman and Tierney 1986; Smith and Deering 1990).

In the section that follows, we review research about how legislator characteristics and group resources affect lobbying efforts. We then state our assumptions about the goals groups pursue when they lobby and present a conceptual model that illustrates how organizations' lobbying decisions during the committee stage are affected by legislator characteristics, organizational forces, and issue context. Next, we describe the data and methods used in our research and specify the statistical model of groups' lobbying decisions at the committee level. The results of our investigation and a discussion of some of the implications follow.

PREVAILING PERSPECTIVES ON LOBBYING STRATEGIES

Most scholars agree that organized interests have incentives to lobby fence-sitters or "swing" legislators, that is, those who are undecided or neutral on an issue (Denzau and Munger 1986; Langbein 1991; Wright 1990).¹ Groups can anticipate a high payoff from

lobbying fence-sitters because these legislators are most susceptible to persuasion (Rothenberg 1992; R. Smith 1984). Many researchers also suggest that groups lobby influential legislators (e.g., members of key committees, committee and subcommittee chairs, and party leaders) because they can set the political agenda and serve as cue givers for their colleagues (Austen-Smith and Wright 1994; Kingdon 1989; Matthews and Stimson 1975; Rothenberg 1992; Wright 1990).

But the literature also contains several conflicting ideas about the congressional lobbying strategies used by organized interests (e.g., Austen-Smith and Wright 1996; Baumgartner and Leech 1996). Although most scholars agree that groups lobby their friends in the legislature, there is disagreement about why groups should expend resources and effort on their regular supporters. One common thread in this body of work is that legislators have the upper hand in relationships with interest groups (Bauer, Pool, and Dexter 1963; Dexter 1969; Hayes 1981; Matthews 1960; Milbrath 1963; Ziegler 1964), granting access primarily to people who share their predispositions and to groups with whom they have established relationships (Ainsworth 1993, 1997; Hansen 1991; Milbrath 1963). Another explanation is that allies in Congress can be enlisted to act as agents on a group's behalf by lobbying colleagues, sponsoring legislation or amendments, keeping an issue off the agenda, and modifying the language of a bill (Denzau and Munger 1986; Hall and Wayman 1990).²

Others argue that groups lobby allies in Congress to counteract the efforts of organizational opponents. The formal model developed by Austen-Smith and Wright (1992, 1994) predicts that, other things being equal, groups are expected to lobby members of Congress who are inclined to oppose their interests in order to persuade them to take the group's position. In essence, a group has no incentive to devote scarce lobbying resources to legislators who are inclined to support it unless those legislators are contacted by the group's organizational opponents.³

probability of voting for a bill is near the midpoint (i.e., $p = .50$). At least implicitly, Austen-Smith and Wright (1994, 1996) appear to view them as legislators whose prior probabilities of voting are indeterminate (i.e., not more or less than .50). Langbein (1991) equates uncertainty with ideological moderation. In general, the various labels—fence-sitter, swing, and undecided—are used to refer to members of Congress who, for whatever reason, are perceived as having ambiguous positions on issues.

² Hall and Wayman's (1990) analysis shows that PAC contributions given to supporters have a substantial effect on supporters' actions in committee. In contrast, contributions play almost no role in mobilizing the opposition.

³ In addition, Kollman (1997) argues that organizations have little choice but to lobby committees ideologically similar to them because groups active in an issue area tend to have the same ideological biases as the committees with jurisdiction over the legislative proposals in that domain. Although Kollman finds a similarity between the aggregate ideology of groups lobbying the same committees, his data also show that more diverse committees attract the lobbying attention of a more diverse array of groups. Because there is a fair amount of ideological diversity on any congressional committee, the question of whom groups lobby in committee remains important. Kollman's data do not indicate which committee members groups choose to lobby.

¹ Researchers have defined fence-sitters in a variety of ways. Rothenberg (1992), for example, defines them as legislators whose prior

To some extent, researchers' expectations about groups' incentives for targeting allies, fence-sitters, and foes are rooted in different interpretations of what it means to lobby and what groups are trying to accomplish at different points in the legislative process. For instance, many studies examine lobbying on roll-call votes with a fixed agenda, at which stage groups can only seek to influence passage or defeat of a bill or motion (Austen-Smith and Wright 1994; Langbein 1991; Rothenberg 1992). If all that is at stake is the outcome of an up or down vote, with no opportunity for legislators to manipulate the agenda or alter proposal content, then the operative goal for organizations will be to expand their coalition to winning size. That is, groups attempt to convert opponents and swing legislators while minimizing defections by likely supporters. In this context, it may be reasonable to define lobbying solely in terms of efforts to reinforce or change legislators' policy positions (Austen-Smith and Wright 1994, 1996).

At points in the legislative process preceding final floor action, persuading legislators to vote a particular way is only part of what groups attempt to accomplish by lobbying. At the agenda-setting and committee mark-up stages, a multitude of decisions about the content of legislation often are made without a vote (Light 1985; Schneier and Gross 1993; Smith and Deering 1990). By enlisting a set of agents to act on their behalf, lobbyists may be able to achieve what they need without much notice and without having to expand their supportive coalition. It is much more difficult for groups to insert their preferences into legislation at later stages (Hall and Wayman 1990). During points in the legislative process when the agenda is fluid, a broader conceptualization of lobbying goals is appropriate; a group will encourage legislators to sponsor favorable legislation, craft legislation that conforms to its interests, change the wording of a bill, and give prominent place on a committee's agenda to favorable bills and amendments.⁴

Aside from studies that focus on legislators' characteristics, research on how groups' advocacy efforts are shaped by their resource capabilities has a long tradition. An investigation of lobbying on trade policy in the 1950s (Bauer, Pool, and Dexter 1963) found that a lack of resources limited organizations' effectiveness as advocates. More recently there is evidence that a group is likely to target legislators from states or districts where it has a strong organized presence (Austen-Smith and Wright 1994; Rothenberg 1989; Wright 1990). In addition, Wright (1996) argues that legislators grant access to groups that contribute PAC funds

because, through their PACs, these groups are more likely than noncontributors to acquire information that will be useful to the legislator.

The amount of personnel an organization devotes to advocacy also may affect its capacity to lobby (Gais and Walker 1991). A single lobbyist will not be able to contact as many legislators as will a staff of ten. Yet, some scholars believe that even a relatively small budget and staff may be used effectively if a group works with other organizations as part of a coalition (Berry 1989; Schlozman and Tierney 1986).

In addition to what is known about direct linkages between resources and lobbying effort, Richard Smith (1984) argues that the quantity and quality of a group's resources affect its ability to formulate arguments that will be compelling to members of Congress. Organizations with a qualitative and quantitative resource advantage over opposing groups are expected to have a greater chance of building and maintaining a supportive coalition over the course of the legislative process. Thus, Smith argues that these organizations will be better able to manipulate the policy positions and interpretations of legislators.

Empirical studies, however, have not assessed how organizational resources affect a group's decision to lobby legislators with different issue positions. Research that focuses on whom groups lobby relies on data about individual legislators to make statements about groups' target choices. For example, Rothenberg (1992) examined which legislators were lobbied by Common Cause, so that group-related determinants of the lobbying decision could not be assessed. Austen-Smith and Wright (1994, 1996) investigated the lobbying activities of multiple groups but only those acting in coalition. This focus on coalitional activity does not allow an assessment of how individual group characteristics affect the lobbying choice or how group and legislator characteristics interact to shape the decision.

By the same token, research on the relationship between organizational resources and lobbying does not explore how resources affect whom groups lobby but rather how resources affect the techniques organizations use to achieve their objectives (Bacheller 1977; Gais and Walker 1991). Only Richard Smith (1984) suggests that resources have implications for a group's ability to influence different legislators and build coalitions in Congress.

HOW ORGANIZATIONS DECIDE WHO TO LOBBY IN COMMITTEE

The definition of lobbying used here is rooted in our assumption that an organized interest tries to accomplish two main legislative tasks when a bill with implications for its interests is referred to a congressional committee.⁵ First, the group seeks to maintain and expand the size of its supportive coalition. If it wants a

⁴ Many scholars in addition to Hall and Wayman (1990) and Denzau and Munger (1986) define lobbying in relatively broad terms (Berry 1989; Gais and Walker 1991; Jewell and Patterson 1986; Schlozman and Tierney 1986; but see Austen-Smith and Wright 1994). This broader view of lobbying also is supported by numerous anecdotes of lobbyists drafting legislation for members of Congress (Abramson 1995; Birnbaum and Murray 1988, 121–2; Cushman 1995; Drew 1996, 114–7; Egan 1995; Engelberg 1995; C. L. Evans 1989; Pear 1996) and even briefing legislators and their staff on proposed legislation (Judis 1996).

⁵ Of course, groups will not try to accomplish these two tasks on every bill referred to committee. A proposal is most likely to merit their attention when it is likely to receive attention in committee and when it has a reasonable chance of moving out of committee.

bill passed (or defeated), then it will need a sizeable number of legislators to accomplish this feat. In order to form a winning legislative coalition, it needs to cast its lobbying net as widely as possible and target traditional opponents as well as undecided members in an effort to persuade them to support the group's interests.

Second, organizations seek to affect the content and fate of proposed legislation (Hall and Wayman 1990). Interest groups are not allowed to introduce legislation, offer amendments, or otherwise participate formally in drafting legislation, so they need to find legislators who will carry out those tasks. Organizations also have incentives to encourage legislators to negotiate and bargain with other committee members in order to enhance support for proposals that reflect their interests, shield proposals from opposing interests, and ensure that proposals move swiftly out of committee.

A group that enlists informed and vigorous advocates for its interests is likely to have a greater chance of achieving its policy objectives than a group that seeks only to persuade legislators to support its interests and, therefore, presumes that the emerging legislation will be consistent with its objectives. Active legislators can have a substantial effect on proposals that are considered in committee. As Hall (1989) discovered in his study of three House committees, between 34% and 45% of the committee members either voted by proxy or failed to vote at mark-up hearings. Thus, "proxy voting tends to augment the power of the active, not preserve the authority of the absent," because a proxy cannot object, compromise, or offer an amendment (Hall 1989, 204).

In contrast to the way lobbying is viewed in many studies, our conceptualization allows for the fact that groups may contact legislators to persuade them to support a particular position *and* to shape the content of proposals that affect an organization's interests. To influence legislators' voting decisions, groups provide information about the pros and cons of a piece of legislation and its electoral consequences, but they also submit draft legislation and amendments as well as other facts, statistics, and arguments to help legislators participate both in bill formulation and coalition building on behalf of the group. Many of the groups in our study acknowledged engaging in activities such as drafting legislation (46%) and enlisting committee members to lobby other legislators on the group's behalf (77%), which implies that the goals of shaping legislation and mobilizing legislators are important components of the lobbying enterprise.

We recognize as well that these two goals (coalition building and affecting legislation) are related. For example, some groups may choose not to work directly to expand the size of their legislative coalition if they can successfully alter the content of a bill. Alternatively, a group may need to accept a less than optimal bill in order to gain the support of some legislators and thus increase the size of its coalition. Groups may use less important provisions of a bill as bargaining chips to attract support, and they may obtain supporters for a

bill by bargaining over the provisions of future legislation.

Thus, we define lobbying as providing information directly to members of Congress (or their staff) to further the two goals described above.⁶ We believe that this definition characterizes what groups do and what they hope to achieve by applying their resources to advocacy.

FORCES THAT INFLUENCE WHO GROUPS CHOOSE TO LOBBY

We believe that an organization's choice of whom to lobby will vary depending on the characteristics of legislators (including their prior issue positions), the resources available to the interest group (i.e., its capacity for lobbying), and the context of the issue. Three points underlie our conceptual argument. First, all else the same, a group will target committee members based on the likelihood of those legislators acting on the group's behalf in committee as well as later in the legislative process. Second, because organized interests differ in their capacity to lobby, the approaches they take to coalition building in Congress will differ. Third, lobbying strategies are expected to differ across policy issues depending on the importance of the issue to an organization and the time available for advocacy.

Legislative allies are expected to be the most important targets of a group's direct lobbying efforts in committee, regardless of whether allies are the targets of opposing organizations' advocacy efforts. A group lobbies its likely committee allies in order to provide them with arguments, issue interpretations, and information that make the strongest case for the group's position.⁷ With these data, legislators with policy preferences similar to those of the group may lobby on the group's behalf, may push favorable amendments and repel unfavorable amendments in committee to strengthen the content of a bill, and may negotiate with their colleagues so that the proposal which emerges from committee has the best chance of survival on the floor (Hall and Wayman 1990).⁸ If legislators are to help control the agenda and tailor legislation for an

⁶ In this way, our definition includes lobbyists meeting with legislators to confirm their support for the organization's interests, persuade them to adopt the organization's position, and ask them to work on the organization's behalf in committee (e.g., contact other legislators, introduce amendments, and change the wording of a key provision). Because the incentives for groups to contact legislators through the grassroots differ from the incentives groups have to lobby through their offices in Washington, lobbying through organization members is not subsumed under our definition (Hojnacki and Kimball 1998).

⁷ Indeed, how an issue is interpreted, or the "spin," affects "the dimensions of judgment on which the issues and policies are evaluated" (R. Smith 1993, 184) and, potentially, the ultimate outcome of the issue debate (McKissick 1995; Riker 1986; Schattschneider 1975; R. Smith 1984, 1993).

⁸ Legislative allies also may ask questions and make arguments during hearings, submit statements for the hearing record or committee report, and request information from executive branch agencies, the Government Accounting Office (GAO), or the Congressional Research Service (CRS) on a particular topic or agency. In general, legislators can act in a variety of ways as groups' agents in committee.

interest group, they need information from the group to parry the arguments of legislative foes.

A group also may lobby legislative opponents and undecided committee members. The latter are second only to legislative allies in their potential to be susceptible to the information and arguments a group provides. The former present a more difficult challenge. During the initial stages of the legislative process, efforts to alter the position of opponents and undecided legislators may not be an efficient strategy. This is especially true for committee members, who are likely to have expertise on an issue. For these reasons, we believe that a group's probability of lobbying an opposing or an undecided committee member is conditional; only those organizations with a strong resource base (such as diverse district ties) will have the capacity to move beyond their allies and lobby opponents and undecided legislators.

Finally, we believe that groups will assign high priority to committee leaders, party leaders, and members of subcommittees with jurisdiction over the relevant proposal. Aside from their potential role as information providers and cue givers for other legislators, these key figures have unique opportunities to shape the content and affect the fate of legislative proposals (see Schneier and Gross 1993).

When groups make decisions about how to build support for their policy objectives in congressional committees, they also must consider what they are able to do, given the issue at hand. Consistent with the literature, we expect that an organized interest will be more likely to lobby any committee member if it is part of an advocacy coalition, has an active PAC, and has a large lobbying staff. In addition, we anticipate that legislators are especially likely to be lobbied by groups with a base of support in their district.

More important, we expect that groups with a comparative advantage in resources will be more likely to move beyond their allies and lobby opposing and undecided committee members. Organizations with fewer resources will be more likely to concentrate solely on their allies in committee. Allies are a better investment for these groups because friends in committee may lobby other legislators on a group's behalf, and they are more likely to be vigorous supporters as proposals move through the legislative process.

The character and context of an issue as well as the nature of congressional action also will influence lobbying decisions. First, other things being equal, we expect that a group will try to lobby more legislators on important issues, when the stakes are high. Second, the amount of time Congress spends on an issue, either in committee or on the floor, influences the ability of organized interests to lobby in Congress (R. Smith 1984). Issues that are well defined or assigned priority by congressional leaders before the session begins are often acted upon quickly, so groups have less time to lobby and may not be able to contact as many legislators as they would like. For example, on issues contained in the Contract with America, such as crime and product liability, the House passed legislation within the first 100 days of the 104th Congress, which afforded

scant time for groups to lobby. Finally, any examination of lobbying strategies must control for the efforts of organizational opponents in order to distinguish between counteractive lobbying of allies and noncounteractive efforts (Austen-Smith and Wright 1994, 1996).

ISSUES, GROUPS, AND DATA

To examine organized interests' decisions about whom to lobby, we focus on four issues considered during the 104th Congress: product liability, financial services deregulation, crime control and criminal justice reform, and grazing use and management. Various proposals were introduced to cap punitive or noneconomic damage awards in product liability lawsuits. Financial services deregulation included measures to allow cross-market access for banks and securities firms (i.e., overhaul of the Glass-Steagall Act); modification or repeal of certain bank regulations and consumer laws; and permission for banks to sell insurance. Various bills were introduced to repeal the ban on certain assault-style firearms and to amend sections of the 1994 anticrime law: allow the "good faith" exception to the exclusionary rule; combine grant programs for police hiring and crime prevention into a single block-grant program; and limit federal appeals by state prisoners, including death row inmates. Finally, a set of proposals sought to overhaul regulations instituted by Interior Secretary Bruce Babbitt in 1995 that affected grazing fees and grazing practices on public lands.

We selected these issues because they vary in terms of public visibility and scope of conflict. Crime and, to a lesser extent, tort reform attracted considerable attention from the media and a broad array of organizations representing diverse interests. The grazing and financial services measures received minimal media attention and affect the interests of a more narrow array of groups.

We compiled a list of 648 groups to whom these four issues conceivably could be of interest by drawing on subject categories in *Washington Representatives* (1995) and *Congressional Quarterly's Washington Information Directory* (1996–97), issue-related stories in the *Congressional Quarterly Weekly Report* and *National Journal*, and congressional committee reports of organizations testifying at issue-related hearings (Appendix A provides details about our sampling method and mail survey). We selected 241 groups for the product liability issue, 119 for financial services deregulation, 160 for the anticrime proposals, and 128 for grazing use and management.

Mail questionnaires were sent to the 648 organizations in May 1996. Follow-up questionnaires were mailed a month later to those not responding. Overall, 211 organizations provided at least some information, yielding a response rate of 33%. For the present analysis our sample consists of the 69 groups who indicated they were taking action on one of the four issues. Even though our study examines only a subset of respondents, there is evidence that these 69 organized interests are representative of the overall universe of

groups that were active on these issues (see Appendix A).

ANALYTIC APPROACH

Because each active organization can potentially lobby every relevant committee member, we examine lobbying at the committee stage using the group-legislator dyad as the unit of analysis.⁹ This approach is consistent with our belief that the decision to lobby a legislator may be affected by variables at three levels of analysis: the dyad, the organization, and the legislator. Studies that focus on the group ignore legislator characteristics relevant to the decision, and studies using the legislator as the unit of analysis ignore individual group qualities as predictors of lobbying activity. The use of either groups or legislators as the unit of analysis also renders impossible any assessment of how their characteristics interact to affect lobbying choices.

For each group-legislator pair, we observe whether the group directly lobbies that legislator. Thus, the dependent variable is whether interest group *i* lobbies legislator *j* on issue *k*, as indicated by responses to our survey. The number of observations equals the number of groups active on an issue multiplied by the number of legislators on the relevant House committee and the leaders of both parties in the House summed across the four issues. Given that our sample includes 69 active interest groups and each issue features roughly 46

relevant House committee members and leaders, the total number of dyads in our analysis is 3,173.¹⁰

Variables

For our statistical analysis, *Decision to Lobby* takes on two values: 1 = the group lobbied the legislator, 0 = the group did not lobby the legislator (see Appendix B for questionnaire items and other details of variable measurement). Because the dependent variable is dichotomous, we use probit analysis to estimate our model of groups' lobbying choices. Table 1 provides summary statistics for each variable and includes the expected effect of each on the lobbying decision.

A legislator's prior position on the issue relative to the interest group is measured using a set of dichotomous variables. The first, *Uncertain*, is coded 1 if the legislator's prior position on the issue is unclear. The second, *Opponent*, is coded 1 if the legislator's prior issue position is at odds with the interest group's position on the legislative proposal. The omitted cate-

⁹ Diana Evans (1996) and John Kingdon (1989) use similar research designs to examine lobbying success and legislators' voting decisions, respectively.

¹⁰ The relevant committees are those that wrote the original legislation: (1) product liability, House Judiciary Committee and members of the House Commerce Committee who served on the Conference Committee (Bliley R-VA, Oxley R-OH, Cox R-CA, Dingell D-MI, and Wyden D-OR); (2) financial services, House Banking Committee; (3) crime, House Judiciary Committee; and (4) grazing use and management, House Resources Committee. Groups were asked whether they lobbied each member of the relevant committee and whether they lobbied any member of the party leadership in the House. So as not to add to the length of the survey, groups interested in product liability were asked about only the Commerce Committee members who sat on the Conference Committee.

gory represents the situation in which the legislator's prior position is consistent with the group's position on the issue. We expect that undecided members will be targeted less often than allies but more frequently than opponents. Other relevant characteristics of legislators are measured with dummy variables for *Committee Leader* (i.e., committee and subcommittee chairs and ranking members), *Subcommittee Member*, and *Party Leader*.

A series of variables measuring different dimensions of groups' resource capabilities also are included in our model. Our measure of *District Support* is coded 2 if the organization's base of support in the legislator's district is strong, 1 if it is moderate, and 0 if it is weak or nonexistent. *PAC* distinguishes between organizations with and without a PAC affiliation using a single dummy variable. *Lobbying Staff* is the number of full-time personnel assigned to lobbying. *Coalition Membership* equals 1 if the organization reported that it joined a coalition to take action on the issue, 0 otherwise.¹¹

Three variables are included to test our expectations about how the context of each issue may influence the ability or inclination of interest groups to lobby at the committee level. First, *Importance* is equal to 1 if the issue is more important than other issues on a group's agenda, about as important as other issues, or the only one of interest to the group; a value of 0 indicates less importance than other issues. Second, we include a proxy measure for the presence and numerical strength of a group's *Organized Opposition* (see Appendix B). This allows us to test whether groups lobby counteractively in committee, as Austen-Smith and Wright (1994, 1996) contend about lobbying at the floor stage. Third, three dichotomous variables distinguish the *Banking*, *Crime*, and *Grazing* dyads from the legislator-group pairs relevant to product liability (our excluded category). We expect a higher incidence of committee lobbying on the banking and grazing issues. The House passed crime and product liability legislation so quickly (within the first 100 days of the 104th Congress) that there was little time for groups to lobby committee members.

A set of multiplicative terms are used to assess whether groups' tendencies to lobby legislators with different prior positions vary according to resource capabilities and number of organizational opponents. Each of the two prior position variables will be multiplied by the measure reflecting an organization's district strength (district support $\times$ uncertain, district support $\times$ opponent) and the number of lobbying staff in Washington (staff $\times$ uncertain, staff $\times$ opponent).

¹¹ Each resource indicator taps a distinct aspect of a group's lobbying capacity. As an alternative to separate treatment, we attempted to combine the indicators into a single index that would reflect an organization's overall resource capacity. We also tried to create an index of a group's Washington-based resource capacity which differed from the overall index by excluding the measure of district ties. Each index was formed by summing the relevant indicators after each was rescaled to range between zero and one. The scale reliability coefficients we obtained were quite low (.09 and .21 for the overall and Washington-based indices, respectively), suggesting that our individual measures should not be combined.

We expect these interactive terms to have positive coefficients in the probit analysis, indicating that abundant lobbying resources enable organizations to move beyond their core supporters in House committees.

The variable tapping the number of opposition groups lobbying a legislator also will be multiplied by the two prior position variables (org. opposition $\times$ uncertain, org. opposition $\times$ opponent). We include these interactive terms to control for the possibility that a group's probability of lobbying a friendly legislator will increase when organizational opponents lobby that legislator. If groups are more likely to lobby their allies in response to the efforts of opposing groups, then the coefficient for org. opposition $\times$ opponent should be negative and roughly equivalent in size to the coefficient associated with the main effect, which should be positive and significant. Recall that the coefficient for the main effect reflects the influence of organizational opponents who are lobbying a given legislator on a group's probability of lobbying regardless of a legislator's position, and that our base (excluded) position measure indicates a legislative ally. Expectations are less precise for undecided legislators. The coefficient for org. opposition $\times$ uncertain may be either zero, positive, or negative, but if negative, it will not be as large as the coefficient measuring the main effect of organized opposition. In other words, we are not sure whether groups would be equally, more, or less likely to lobby undecided legislators relative to their allies in response to organized opposition.

Model Diagnostics

The use of a standard probit analysis presumes that our observations are independent. Given the nature of our data, this assumption is questionable. Because each element of a dyad appears in numerous other dyads, it is quite possible that all dyads sharing a particular legislator or group are related. For this reason, we base our inferences on robust standard errors that are calculated by applying Huber's (1967) formula to each cluster of observations identified with a single organization (see Beck 1996 and Beck and Tucker 1996 on the use of robust standard errors).¹² Appendix C presents information about an alternative estimation strategy we employed to remedy the cross-unit correlation.

RESULTS

The results of a probit analysis of organized interests' decisions to lobby members of selected House committees appear in Table 2. The first column shows the maximum likelihood coefficient estimates for each of the exogenous variables associated with the decision to

¹² Specifically, in Stata 5.0 we use the *probit* command with the *cluster* option to estimate our model. The robust standard errors are substantially larger than the usual probit standard errors, indicating that interdependence is present. We also estimated the robust standard errors that apply to each cluster of observations identified with a single legislator. These results provide broader support for the hypotheses we test than do the results presented in Table 2.

lobby; the robust standard errors and *p*-values are shown in the second and third columns, respectively. Overall, the fit of the model is quite good, and the results provide considerable support for our conceptual model of organizations' lobbying decisions in committee.¹³

Table 2 reveals that, compared to legislative allies, legislators with opposing and uncertain issue positions are less likely to be lobbied. As expected, the coefficient estimate for opposing legislators is larger in absolute

value than the estimate for uncertain legislators. In substantive terms this means that organizations are likely to assign the highest priority to lobbying allies on committees, a lower priority to those who are undecided or whose positions are unclear, and lowest priority to those whose prior issue positions conflict with their own. We examine the effect of legislators' prior positions on the lobbying decision in more detail below.

One other legislator characteristic included in our model also plays a significant role in the lobbying decision. As shown in Table 2, committee leaders are more likely to be the target of direct lobbying efforts than are other committee members. This is not surprising, since leaders shape the content of legislation and often are instrumental in determining whether, and how swiftly, proposals move beyond committee.

Like committee leaders, subcommittee members also have more opportunities than other committee members to modify the contents of a bill under consideration. Yet, our findings provide no support for the

¹³ We estimated other model specifications with measures that controlled for freshman status and for the size and type of an organization's membership. In addition, we tested whether groups' lobbying choices vary across different types of groups. The results shown in Table 2 remain essentially the same under these alternative specifications. We also tested whether separate indicators were needed to capture the effects of moderate and strong district ties on groups' lobbying choices. The use of two measures of district ties and four interaction terms reduced the efficiency of our estimates and complicated the interpretation of the effects of the position and district tie variables, but the conclusions we draw from the results shown in Table 2 were left unchanged. These results are available from the authors.

port for parliaments in central and eastern Europe, so I use the same overall economic evaluation variable as in the previous two equations. In addition, I include respondents' assessments of how well Congress is doing its job. Particularly strong short-term evaluations should significantly affect respondents' evaluations of the institution in general (Hibbing and Theiss-Morse 1995).⁸ Finally, I control for the same demographic factors as in the trust and presidential equations, several of which are correlated with support for another institution, the Supreme Court (Gibson and Caldeira 1992),⁹ so they may also affect support for Congress.

⁸ Some may suggest that the congressional thermometer and the congressional approval rating tap the same concept. While the two are correlated ($r = .36$), their relationship is far weaker than that between the Reagan feeling thermometer and the rating approval for Reagan ($r = .82$).

⁹ Some might suggest I should include the media consumption variables in the presidential and congressional thermometer equations. The bivariate correlations, however, are all quite small, with the majority under .06.

Figure 3 depicts the simultaneous equation model. I do not expect the presidential and congressional thermometers to affect one another. Because specific support implies support for leaders themselves, whereas diffuse support refers to evaluations of what leaders represent, measures of specific and diffuse support should be independent in the short run (Easton 1975, 444–5). Empirically, Patterson and Caldeira (1990) find that presidential popularity has no effect on public confidence in congressional leaders. In addition, Gibson and Caldeira (1992) find no relationship between specific and diffuse support for the Supreme Court.

DATA

Although trust has tended to decrease since the mid-1960s, making time-series analysis attractive, a number of factors militate against a reliable analysis of change over time. For example, using NES data, the congressional thermometer and questions about perceptions of

government effectiveness are only available for presidential years. In addition, the congressional thermometer and items on traditional views date only from 1988. Moreover, the NES uses a varying number of issue items from year to year, which undermines the comparability of policy satisfaction and mean issue position scores. Therefore, I rely on two cross-sectional data sets, the 1988 and 1996 NES.

The 1988 NES is particularly well suited for studying political trust. The late 1980s were "a relatively quiet period in American social, political, and economic life, in many ways parallel to what has been characterized as the quiescent fifties" (Neuman, Just, and Crigler 1992, 40). By 1988, the Iran-Contra affair had faded, so this scandal was not a central issue during that year's interviews. The 1988 NES allows for more confident generalizations than surveys during periods of political upheaval. It also offers a particularly useful combination of variables. It asks respondents to place themselves and the federal government on six separate issues, compared to just three in 1992, and so provides a more reliable estimate of respondents' policy satisfaction.¹⁰

Although the presence of a strong third-party alternative may alter the relationship between trust and other variables (A. Miller and Listhaug 1990), the fact that trust increased between 1994 and 1996 requires examination. Unfortunately, the NES stopped asking respondents to place the federal government on the seven-point issue scales after 1992 and asked only one seven-point foreign policy item after 1988. Rather than the absolute distance between respondents' placement of self and the federal government, I take absolute distance between their placement of self and each of the parties. Such a formulation is appealing, given that control of the federal government was divided during this period. All other variables in the model are available in 1996.

RESULTS

Appendix B presents descriptive statistics for each of the variables in the multivariate analyses. I convert all three endogenous variables to a scale of -1 to 1 in order to facilitate comparison of their relative effects. I convert each of the explanatory variables to a scale of 0 to 1 for the same purpose.¹¹

Effects of the Endogenous Variables

Table 1 presents the two-stage least-squares estimates from the hypothesized simultaneous equation model us-

ing the 1988 data. I will discuss the 1996 data separately. To provide a sense of relative effect sizes, I present in Table 1 the direct and total effects of a change of one standard deviation in the explanatory variables. Direct effects are simply reflected in the parameter estimate, while the total effects of the endogenous variables are calculated by $\beta^{-1}-I$, where β^{-1} is the inverse of the matrix of endogenous direct effects, and I is the identity matrix. Since the endogenous variables are all two-point scales, the effect that one endogenous variable has as a percentage of another is the effect divided by two.

First, note that the endogenous variables seem to affect one another as hypothesized. All have statistically and substantively significant effects in the appropriate equations. Second, note that trust's effect on the Reagan thermometer score is substantially larger than the reverse. In terms of direct effects, a change of one standard deviation in political trust causes a roughly 10.5% change in the Reagan score. Conversely, a similar change in the Reagan thermometer causes only a change of about 6% in trust. In moving from most to least trustful, the Reagan thermometer declines by nearly 45% of its range, while moving from warmest to coolest on the Reagan thermometer decreases trust by only 19% of its range.

In addition, the direct effect of trust on the Reagan thermometer relative to other variables in the model is quite large. Viewed in terms of a change of one standard deviation, trust's effect is far larger than any variable except partisanship. Indeed, the effect of the next most influential variable, mean issue position, is half the size of political trust. If I take into account the range of each of the explanatory variables, trust's effect is larger than that of all factors, including partisanship.

Focusing entirely on direct effects, however, understates the full effect of political trust. For instance, the total effect of a change of one standard deviation in trust is more than 15% of the Reagan thermometer's range, and its influence is larger than that of any variable, no matter the change criterion. Using 1964 as a baseline dramatically illustrates trust's importance. The difference between the median in 1988 and 1964 is .60 points.¹² If, in 1988, political trust were to increase by this amount, the Reagan thermometer would increase by .388 points, or more than 19% of its range. While the presidential thermometer should not be confused with presidential approval ratings, this decrease of roughly 19% in the thermometer score can be used to approximate how much approval declined as a result of decline in political trust. To do so, I estimate the following model, cast in logit form:

$$\text{Pr}(\text{APP}_i) = (1 + \exp[-(\beta_0 + \beta_1(\text{PFT}_i) + \beta_2(\text{PID}_i) + \beta_3(\text{ECON}_i) + \beta_4(\text{ISS}_i) + \beta_5(\text{AA}_i))])^{-1} \quad (1)$$

where $\exp$ is the exponentiation to the base e , the subscript i refers to the i th individual, $\text{Pr}(\text{APP})$ is the probability that the respondent approves of the president,

¹⁰ When I estimated the model with the 1988 data but used only the three issues available in the 1992 data set, policy satisfaction did not approach statistical significance.

¹¹ While space does not allow full presentation of the first-stage equations, a discussion of their goodness of fit is in order, since that affects the efficiency of the second-stage estimates. In 1988, the R^2 for the political trust, presidential thermometer, and congressional thermometer equations is .22, .47, and .16, respectively. In 1996, it is .14, .60, and .22. These fit measures for the first-stage equations are satisfactory for attitudinal data and compare favorably with other models that employ two-stage least-squares estimation for purposes similar to mine (see Huckfeldt et al. 1995; Kinder and Mendelberg 1995).

¹² Since the 1988 distribution is skewed, it is more appropriate to compare the medians. The precise median is +.054 in 1964, compared with -.546 in 1988.

PFT is the presidential feeling thermometer, PID is the respondent's location on the seven-point partisanship scale, ECON is the respondent's overall economic evaluation, ISS is the respondent's mean self-placement on the issues, and AA is a dummy variable indicating whether the respondent is African-American.

I use the parameter estimates generated from this model to simulate a predicted approval score based on actual responses to these questions. If the respondent's predicted approval score is greater than .50, then the respondent is scored as approving. If it is less than or equal to .50, the respondent is scored as disapproving. This simulation predicts an approval rating of 58.9%, only .9 percentage points greater than the observed approval rating in the sample.

Using the same logistic regression estimates, I calculate a second predicted score, again placing all variables at their observed scores except for the presidential thermometer. To each respondent's observed score, I add the .388 points that the thermometer would increase if trust were at the 1964 level. This simulation predicts an adjusted approval rating of 75.3%, which is 16.4 percentage points greater than the first predicted score. In other words, the model suggests that presidential approval would have been about 16 percentage points higher in the late 1980s had trust not declined since the mid-1960s, *ceteris paribus*. Interestingly, this difference in approval is only slightly larger than the gap in the outgoing approval ratings of Ronald Reagan and Dwight Eisenhower, who was another popular two-term Republican incumbent (Gallup 1972, 1651). In comparing approval ratings in the contemporary period with the beginning of the survey era, moreover, Brody (1991) observes a difference of approximately this amount. This suggests that political trust may be at least partially responsible for the lower presidential approval ratings in recent years compared to those in the late fifties and early sixties. Although largely ignored in the literature on presidential popularity, decreasing political trust can powerfully damage the president's standing.

Turning to the other endogenous variable, the congressional thermometer's direct and total effects on trust are larger than the reverse, but trust's effect on institutional assessments of Congress is substantial. For example, the total effect of a change of one standard deviation in the congressional thermometer on political trust is about 21% of trust's range. This is substantially larger than the nearly 10% change in the congressional thermometer caused by a corresponding change in trust. By far the most influential variable in the congressional equation is trust. The effect of a change of one standard deviation in the next most influential variable, approval of Congress, is 38% smaller than that of trust.¹³

While the implications of cooler feelings about the

president are fairly straightforward, the implications of declining support for Congress as an institution are more speculative. When diffuse support wanes, the public may be more inclined to favor alternatives that bypass institutions, such as direct democracy. The Founding Fathers, however, created representative institutions because they feared this impulse toward direct citizen control. Furthermore, experiments in direct democracy have not proved altogether satisfying in terms of either policy outcomes or increasing political support (Citrin 1996). In addition, declining institutional support increases the possibility of fundamental change to the political system in the face of a serious crisis, even to an institutional structure as stable as that of the United States (Lipset and Schneider 1983). Any significant downward movement in the congressional thermometer must be viewed with concern.

As far as construct validity is concerned, the model suggests that trust is more a function of institutional than incumbent support. The effect of the congressional thermometer on trust is more than four times larger than that of the presidential thermometer, other things being equal. It is interesting to note, however, that trust seems to have a larger causal influence on support for incumbents than for institutions. While trust affects both substantially, its effect on the former is about one-half larger.

In sum, taking into account the simultaneity between political trust and other variables demonstrates trust's system-level relevance. Rather than just reflecting dissatisfaction with political leaders, political distrust is a powerful cause of this dissatisfaction. It affects both specific and diffuse support, as well as being affected by them.

Effects of Exogenous Variables on Political Trust

The total effects of the exogenous variables are calculated by $-\beta^{-1}\Gamma$, where $-\beta^{-1}$ is the negative of the inverse of the matrix of endogenous direct effects, and Γ is the matrix of exogenous direct effects.¹⁴ An exogenous variable's effect across its range can be easily calculated by multiplying a variable's total effect by 1, since the range of all exogenous variables is one unit. Dividing this number by two yields the total effect of an exogenous variable across its range, as a percentage of the endogenous variable.

This model suggests that political trust does seem to have policy success and policy satisfaction components. Both overall economic evaluations and perceived gov-

¹³ In terms of construct validity, the congressional thermometer seems, as hypothesized, to reflect more diffuse than specific support. In dramatic contrast to the Reagan thermometer, it depends only marginally on partisanship, insignificantly on mean issue position, and positively on political engagement.

¹⁴ Based on a one-tailed test, if I am less than 95% confident that a variable's effect differs from 0, I treat the effect as 0 in calculating the total effects. In 1988, these variables are newspaper consumption, foreign policy satisfaction, income, age, and race in the trust equation; income and sex in the Reagan thermometer equation; and mean issue position, overall economic evaluation, income, and age in the congressional thermometer equation. In 1996, these variables are television news consumption, newspaper consumption, policy satisfaction with the Republicans, economic evaluations, and sex in the trust equation, and partisanship, political engagement, economic evaluations, income, and sex in the congressional thermometer equation.

ernment effectiveness significantly affect political trust. A change of one standard deviation in each of these variables can cause a change in trust of 4% and 4.4%, respectively. Across their ranges, they can increase trust by up to 24% and 14%. These results confirm previous findings about the economy's importance in understanding fluctuations in political trust (Citrin and Green 1986; A. Miller 1983). In fact, by allowing economic evaluations to enter the model through a direct effect on trust and indirectly through an effect on the other endogenous variables, the 1988 data suggest that the economy can be even more influential than previous research allows. Not surprisingly, the presidents who presided over the bulk of decline in political trust, Nixon, Carter, and Bush, all faced struggling economies at some point during their presidency.

The respondent's perceived distance from the federal government on domestic policy issues is statistically significant but not on foreign policy issues. This suggests that leaders may be somewhat more effective in raising trust levels by pursuing a domestic policy agenda, provided people are satisfied with its direction. In light of this finding, it is also noteworthy that Nixon, Carter, and Bush were relatively more successful with foreign than domestic policy.

The finding for the traditional world view variable, that is, statistical and substantive significance, represents an advance for research on political trust. Its parameter estimate is larger than all exogenous variables except economic evaluations. This indicates that public dissatisfaction with changes in general societal norms, and implicitly in government's role in promoting or condoning them, affects people's view of government in general. Since "family values" were not part of the political dialogue in the 1960s, a period many consider as a watershed for changing morals, concern about these changes may explain the decrease in political trust in the mid-1960s.

The model also produces some interesting results relating to political communication. As expected, television news consumption lessens political trust. The total effect of maximum television news consumption is -136 points, which represents a drop of nearly 7% of trust's range. While the television news consumption coefficient is negatively signed, that for newspaper consumption is *positively* signed, although neither of these estimates reaches conventional levels of statistical significance. A. Miller, Goldenberg, and Erbring (1979) obtained the same opposing sign and speculated that it was due to demographic differences between television and newspaper consumers. The present analysis, however, controls for education, age, race, income, and sex, which suggests that the nature of the media may explain the difference (see Hart 1994).

THE 1996 DATA

While the trend in political trust since the mid-1960s has been mostly decreasing, the trust index median increased by 3.6 percentage points between 1994 and 1996. More recent data suggest that the trend has continued (Pew Foundation 1998). By using 1996 data

to replicate the simultaneous equation model, I can explore the causes and effects of this increase. The 1996 results appear in Table 2.

Again, the endogenous variables appear to affect one another as hypothesized. As was the case in 1988, the parameter estimate for trust on feelings about the president is more than two and one-quarter times larger than vice versa, although the magnitude of the effect in both directions is somewhat smaller in 1996. Trust's effect on the congressional thermometer in 1996 is slightly smaller than in 1988 as well, but the reciprocal link is slightly larger. Taken together, these results suggest that trust has become somewhat more closely linked to institutions than to incumbents.

By multiplying trust's total effect on feelings about Clinton by the amount that trust increased between 1994 and 1996, I can estimate its benefit to the president. I find that the increase of 3.6 percentage points in trust yields about a 1.6% increase in the Clinton thermometer. Given that Clinton's thermometer score increased by approximately 5% between 1994 and 1996 (Rosenstone, Miller and Kinder 1997), my model suggests that increasing trust accounts for about one-third of Clinton's jump, other things being equal. There is little doubt that President Clinton had more success in the second half of his first term, and perhaps increasing political trust played a role. By performing much the same calculation for the congressional equation, an increase of 3.6% in trust would increase the congressional thermometer by 1.2%.¹⁵

Turning to the exogenous variables, each has a direct effect on trust in the same direction in both years, with one exception. In 1988, being African-American carried a positive sign, although its effect was not statistically significant. In 1996, blacks were significantly less trustful. Although bivariate analysis shows that they were slightly more trustful than other races in 1996 (see Abramson, Aldrich, and Rhode 1998, 84), the reverse is true when proper controls are applied. A secondary analysis demonstrates that controlling for feelings about President Clinton, specifically, causes the change. This suggests that, once the expected tendency for blacks to trust a Democratic administration is taken into account, African-Americans are somewhat less trustful of the government in Washington. Perhaps they found the election and reelection of a Republican Congress in 1994 and 1996 particularly troubling.

It is also noteworthy that economic evaluations do not have a direct effect on trust in 1996. Although the economy's estimated effect on the presidential thermometer is 50% larger in 1996 than 1988, thus increasing its indirect effect on trust, its direct effect cannot be confidently discerned from 0. Hence, the economy's total effect in 1996 is less than one-fifth that of 1988.

What has caused the increase in trust? Given the set

¹⁵ Because the 1994 NES did not include the congressional thermometer, I cannot determine the actual percentage of improvement.

of reciprocal relationships, all three endogenous variables (trust, feelings about the president, and feelings about Congress) will tend to remain at relatively low levels, barring significant changes in the exogenous variables. That is, the endogenous variables are unlikely to change without reason. For an exogenous variable to be a cause of increased trust, it must meet two conditions. First, it must have a substantial direct or indirect effect on trust in 1996. This eliminates the media consumption variables and policy dissatisfaction with the Republicans, which are not statistically significant, and political engagement, which does not have a substantively large effect. Second, the variables that affect trust must have changed substantially between 1994 and 1996, which eliminates the glacially changing social characteristics. Table 3 presents the differences in means of the substantive exogenous variables that either directly or indirectly affect trust.

To calculate a variable's contribution to increasing

trust, I multiply the amount that it changed during the period by its total effect on trust. While previous scholarship indicates that increased trust may be the result of an improved economy (A. Miller 1983; Citrin and Green 1986), these results suggest otherwise. The 1.5 percentage point change in overall economic evaluations is not statistically significant and fails to cause a substantive change in trust. In addition, the differences in means for traditional world view, policy satisfaction, mean issue position, and partisanship are trivial.

People's perceptions of government effectiveness and their evaluations of congressional job performance improved markedly, however. Although the former item was not asked in 1994, the mean score in 1992 was .206, compared with .394 in 1996. By multiplying this difference by the variable's total effect on trust in 1996, I find that improved perceptions of government effectiveness increased political trust by 1.7%.

Improved congressional job approval also seems to have contributed indirectly to an increase in trust through its effect on feelings about Congress as an institution. The contribution can be calculated by multiplying the difference in means by the total effect of approval on trust. I find that the .113-point increase in the mean job approval rating of Congress accounts for an increase of 1.6% in trust, *ceteris paribus*.

These data also allow me to replicate the presidential approval simulation, this time comparing Bill Clinton and Lyndon Johnson. The results from equation 1 for the 1996 data, which I use to generate the predicted and simulated approval ratings, appear in the right-hand column of Appendix C. Between 1964 and 1996, the trust median dropped from +.054 to -.623, or by .677 points. To simulate 1996 feelings about Clinton given 1964 trust, I multiply .677 by the total effect of a one-unit change in trust on the Clinton thermometer. This calculation suggests that, on average, people's feelings about the president would be .295 points higher with trust at 1964 levels. I add this to each person's observed feeling thermometer score. If this adjustment produces a score greater than 1, I assign a score of 1.

In 1996, 67.5% of the sample approved of Bill Clinton. My predicted score, with trust and the other variables at their observed levels, is a somewhat higher 70.4%. When respondents' observed presi-

dential thermometer scores are increased by .295 points, the adjusted approval rating is 78.3%. This is substantially higher than the 71% recorded for Johnson in late 1964, but it is noteworthy that Clinton's NES approval rating is almost 10 points higher than his Gallup rating during the same period. In fact, the gap of 8 percentage points between the predicted and adjusted scores is only one point smaller than the difference in the Gallup second-term preinaugural job approval ratings for Johnson and Clinton (Gallup Organization 1998, 15). Consistent with the 1988 data, these results further suggest that trust may be at least partially responsible for the lower contemporary presidential approval ratings.

CONCLUSION

These findings about political trust have important implications. First, higher levels of trust are of great benefit to both elected officials and political institutions. More trust translates into warmer feelings for both, which in turn provides leaders more leeway to govern effectively and institutions a larger store of support regardless of the performance of those running the government.

This study also adds to our understanding of what can increase political trust. In addition to the economy, improved perceptions of government effectiveness and higher levels of congressional approval can effect sub-

stantial changes. With regard to the former, perhaps Clinton's efforts in the second half of his first administration are instructive. While the public was not willing to embrace sweeping new policies such as health care reform, it seemed satisfied by the "bite-sized" proposals in areas of broad interest. Initiatives such as a minimum wage increase, a large-scale literacy program, strong stands on the environment, and family and medical leave can make a difference.

With regard to congressional approval, the election of the first Republican Congress in 40 years likely provided the public with an increased sense that the political system can respond to citizen discontent. Once in office, the minor but well-publicized institutional changes adopted by Congress in early 1995, such as cutting the number of committees and their staffs and requiring that laws apply equally to members of Congress and ordinary Americans, may have contributed to the improvement in approval as well. That these changes were institutional in nature is noteworthy, given the continued unpopularity of congressional leaders such as Newt Gingrich and certain congressional decisions, such as the government shutdown (see Hibbing and Theiss-Morse 1995).

In sum, these results suggest that political leaders can take steps to increase trust. But will the increases be as fleeting as those of the Reagan years? The country continues to face fundamental problems on issues such as race, Social Security, Medicare, and health care that will likely require large-scale solutions. As the health care reform fiasco of 1993–94 suggests, however, a public no longer possessed of a core trust in its political system is easily frightened by negative campaigns against broad new initiatives. On the supply side, leaders concerned about public reprisals will be less likely to support such initiatives. Without public support for solutions, problems will linger, will become more acute, and if not resolved will provide the foundation for renewed discontent.

APPENDIX A: NES QUESTION WORDING

Political Trust

People have different ideas about the government in Washington. These ideas don't refer to Democrats or Republicans in particular, but just to the government in general. We want to see how you feel about these ideas. For example:

1. How much of the time do you think you can trust the government in Washington to do what is right—just about always, most of the time, or only some of the time? (TRUST)
 1. Just about always
 0. Most of the time
 - 1. Some of the time
2. Do you think that people in government waste a lot of the money we pay in taxes, waste some of it, or don't waste very much of it? (WASTE)
 1. Not very much
 0. Some
 - 1. A lot
3. Would you say the government is pretty much run by a few

big interests looking out for themselves or that it is run for the benefit of all the people? (INTEREST)

1. For the benefit of all
- 1. Few big interests
4. Do you think that quite a few of the people running the government are crooked, not very many are, or do you think hardly any of them are crooked? (CROOKED)
 1. Hardly any
 0. Not many
 - 1. Quite a few

Missing Data: To conserve cases, I require that respondents answer only one question. In 1988, 9.1% skipped one of the four questions, 1.7% skipped two, and .6% skipped three. Only .6% were excluded from the analysis. In 1996, the corresponding percentages were 4.2, .5, .1, and .3. If I require that respondents answer all four questions, the results are consistent.

Mean Issue Position (1988 Data)

1. Some people think the government should provide fewer services, even in areas such as health and education in order to reduce spending (7). Other people feel it is important for the government to provide many more services even if it means an increase in spending (1). Where would you place yourself on this scale, or haven't you thought much about this?
2. Some people feel the government in Washington should see to it that every person has a job and a good standard of living (1). Others think the government should just let each person get ahead on their own (7).
3. Some people feel that the government in Washington should make every effort to improve the social and economic position of blacks (1). Others feel that the government should not make any special effort to help blacks because they should help themselves (7).
4. Some people feel that the government in Washington should make every effort to improve the social and economic position of blacks and other minorities (1). Others feel that the government should not make any special effort to help minorities because they should help themselves (7).
5. Some people feel it is important for us to try to cooperate more with Russia (1), while others believe we should be much tougher in our dealings with Russia (7).
6. Some people believe that we should spend much less money for defense (1). Others feel that defense spending should be greatly increased (7).
7. There is much concern about the rapid rise in medical and hospital costs. Some people feel there should be a government insurance plan which would cover all medical and hospital expenses for everyone (1). Others feel that all medical expenses should be paid by individuals and through private insurance plans like Blue Cross or some other company-paid plans (7).
8. Recently there has been a lot of talk about women's rights. Some people feel that women should have an equal role with men in running business, industry, and government (1). Others feel that a woman's place is in the home (7).

Policy Satisfaction (1988 Data)

Of the eight issue position items, respondents are asked to place themselves and the federal government on six, which I list below. I take the absolute value of the distance between the self-placement and the placement of the federal government.

Domestic

1. Government services
2. Government job
3. Aid to blacks
4. Aid to minorities

Foreign

1. Cooperation with Russia
2. Defense spending

Missing Data: To conserve cases, I require that respondents provide only one valid response for issue position and policy satisfaction indexes. It also bears noting that the aid to minorities and aid to blacks questions were asked to separate half-samples in the 1988 NES. For mean issue position, 19.8% of the sample skipped one item, 10% skipped two, 5.3% skipped three, 3.4% skipped four, 2% skipped five, 1.4% skipped six, and 1.2% failed to answer any. For domestic policy satisfaction, 18.9% of the sample missed one question, 10.5% missed two, and 11.5% failed to answer any. For foreign policy satisfaction, 15.2% missed one, and 14.8% answered neither.

Mean Issue Position (1996 Data)

1. Some people think the government should provide fewer services even in areas such as health and education in order to reduce spending (7). Other people feel it is important for the government to provide many more services even if it means an increase in spending (1).
2. Some people believe that we should spend much less money for defense (1). Others feel that defense spending should be greatly increased (7).
3. There is much concern about the rapid rise in medical and hospital costs. Some people feel there should be a government insurance plan which would cover all medical and hospital expenses for everyone (1). Others feel that all medical expenses should be paid by individuals and through private insurance plans like Blue Cross or some other company-paid plans (7).
4. Some people feel the government in Washington should see to it that every person has a job and a good standard of living (1). Others think the government should just let each person get ahead on their own (7).
5. Some people feel that the government in Washington should make every effort to improve the social and economic position of blacks (1). Others feel that the government should not make any special effort to help blacks because they should help themselves (7).
6. Some people say that the best way to reduce crime is to address the social problems that cause crime, like bad schools, poverty, and joblessness (1). Other people say the best way to reduce crime is to make sure that criminals are caught, convicted, and punished (7).
7. Some people think it is important to protect the environment even if it costs some jobs or otherwise reduces our standard of living (1). Other people think that protecting the environment is not as important as maintaining jobs and our standard of living (7).
8. Some people think we need much tougher government regulations on business in order to protect the environment (1). Others think that current regulation to protect the environment are already too much of a burden on business (7).
9. Recently there was been a lot of talk about women's rights. Some people feel that women should have an equal role with men in running business, industry, and govern-

ment (1). Others feel that a woman's place is in the home (7).

Policy Satisfaction (1996 Data)

Of the nine items above, respondents are asked to place themselves and both major parties on the four below. I take the mean absolute difference between the placements of self and the respective parties.

1. Government services
2. Defense spending
3. Environment and jobs
4. Environment regulation

Missing Data: To conserve cases, I require that respondents provide only one valid response for issue position and policy satisfaction indexes. For mean issue position, 16.7% of the sample skipped one item, 9.2% skipped two, 5.2% skipped three, 3.2% skipped four, 1.5% skipped five, 1.2% skipped six, 1.1% skipped seven, .4% skipped eight, and .8% failed to answer any. For satisfaction with the Democrats, 16.6% of the sample missed one question, 8.7% missed two, 6.5% missed three, and 6.8% failed to answer any. For satisfaction with the Republicans, 16.4% missed one, 9.6% missed two, 6.3% missed three, and 6.8% failed to answer any.

Traditional World View

Responses to these items range from agree strongly to disagree strongly. I code each item to run from most tolerant to most traditional.

1. The newer lifestyles are contributing to the breakdown of our society.
2. The world is always changing and we should adjust our view of moral behavior to those changes.
3. This country would have many fewer problems if there were more emphasis on traditional family ties.
4. We should be more tolerant of people who choose to live according to their own moral standards, even if they are very different from our own.

Missing Data: To conserve cases, I require that respondents provide only one valid response. In 1988, 1.9% skipped one of the four questions, .3% skipped two, and .5% skipped three. Only .6% were excluded from the analysis. In 1996, the corresponding percentages were .8, .2, .1, and .3. If I require that respondents answer all four questions, the results are consistent.

Perception of Government Effectiveness

The item used to tap this concept is the second part of a two-part question. First, respondents are asked what is the single most important problem facing the government. Second, they are asked "how good a job is the government in Washington doing in dealing with this problem: a good job, only fair, or a poor job."

Missing Data: To conserve cases, I place those who do not identify a most important problem at the scale's midpoint. In 1988, 1.4% failed to identify a most important problem. Since the most important problem questions were asked to only a half sample in 1996, 51.2% were placed at the midpoint.

Congressional Approval

I use the four-point scale that asks respondents how strongly they approve or disapprove.

Missing Data: To conserve cases, I place those who do not provide a response to the approval question at the scale's midpoint. In 1996, 8.8% of cases fall into this category; in 1988, 6.27%.

An Information Rationale for the Power of Special Interests

SUSANNE LOHMANN *University of California, Los Angeles*

Political decisions are often biased in favor of special interests at the expense of the general public, and they are frequently inefficient in the sense that the losses incurred by the majority exceed the gains enjoyed by the minority. This article explains the bias in terms of information asymmetries and the free-rider problem. First, incumbents increase their reelection prospects by biasing policy toward groups that are better able to monitor their activities. Second, because smaller groups are better able to overcome the free-rider problem of costly monitoring, policy will be biased in their favor. Third, the effect of asymmetric monitoring on voter welfare is ambiguous. The inefficiencies created by the policy bias are offset by a positively valued selection bias: Incumbents of above-average quality are more likely to survive voter scrutiny than are low-quality types.

In many areas of public policy, government favors special interests at the expense of the general public. That favor may take the form of subsidies, tax breaks, or market intervention through regulatory or trade policies. The "rural bias" in industrialized democracies illustrates the inequities and inefficiencies that often result. At the expense of taxpayers and consumers, agricultural price supports improve farm income. In the United States, one-third of the earnings from farming are due to protective agricultural policies; the corresponding proportions are one-half and two-thirds for the European Union (EU) and Japan, respectively.

The implied levels of taxation for agricultural support are quite extraordinary. In 1990, the average cost per nonfarm household amounted to \$1,400 a year, and this cost is expected to increase to \$1,800 (in 1990 dollars) by 2000. According to some estimates, a phased reduction of 50% in agricultural protection would increase economic welfare in the United States, the EU, and Japan by \$32 billion (in 1985 dollars); this number captures the increase in consumer surplus net of the loss in producer surplus. Agricultural protection persists in industrialized economies even though farm output contributes only 2–3% to GDP and the percentage of voters who are members of farm households has dwindled into single digits. (Statistics are drawn from Anderson and Tyers 1992 and *Economist* 1992.)

In many developing countries, policy exhibits an urban bias even though the agricultural sector contributes critically to the national economy and farmers are in the majority (Bates 1981; Lipton 1977). Governments intervene in markets to lower the relative price of farm products, in effect taxing the countryside and subsidizing urban consumers. The reverse power-in-numbers effect manifested in rural and urban biases is

one of the most intriguing puzzles in the political economy of development.

This article is structured as follows. I first review the explanations for policy biases and inefficiencies provided by the literature and argue that these explanations are incomplete. I then present my informational theory as an improvement on existing theories. Next, I develop a formal model, deriving the policy and selection biases that follow from information asymmetries across groups of voters and endogenizing these information asymmetries as resulting from differences in group size. I then outline the argument informally. I subsequently compare the implications of my theory to existing empirical results and discuss how they might be tested empirically. Finally, I present some extensions of the model and discuss the prospects for political reform.

LITERATURE REVIEW

Economists, who denounce the social deadweight losses arising from inefficient redistribution, are quick to identify the potential for Pareto-improvements: Each member of society could be made better off if special interest handouts were eliminated and the people who had gained from them were to compensate the losers. Theoretically, transaction costs can be invoked to explain why Pareto-improvements fail to be realized: It may be prohibitively costly or infeasible for the winners to pay the losers (Coase 1960). To the extent that transaction costs are impossible to measure, this hypothesis is irrefutable and thus vacuous. As a practical matter, the potential gains from eliminating the policy bias toward special interests appear so high as to render the transaction cost hypothesis implausible as an explanation. Instead, social scientists identify various deficiencies in political processes or institutions as the causal factor driving inefficient redistribution.

The Free-Rider Problem of Collective Action

In *Federalist 10*, James Madison raised the specter of democracy turning into a tyranny of the majority, that is, a political majority acquiring benefits at the expense of a political minority. With this admonition in mind, it

is all the more puzzling that politicians cater to narrow special interests at the expense of the electorate at large.

Olson (1965, 127–8) identifies the free-rider problem of collective action as the source of the policy bias toward special interests:

Since relatively small groups will frequently be able voluntarily to organize and act in support of their common interests, and since large groups normally will not be able to do so, the outcome of the political struggle among the various groups in society will not be symmetrical. . . . The small oligopolistic industry seeking a tariff or a tax loophole will sometimes attain its objective even if the vast majority of the population loses as a result. The smaller groups—the privileged and intermediate groups—can often defeat the large groups—the latent groups—which are normally supposed to prevail in a democracy. The privileged and intermediate groups often triumph over the numerically superior forces in the latent or large groups because the former are generally organized and active while the latter are normally unorganized and inactive.

In a democracy characterized by regular free elections, the free-rider problem of collective action is not sufficient to explain why elected politicians cater to special interests. We would expect rational voters to see through political attempts to curry favor with special interests at their expense. A disaffected majority aware of this policy bias could then punish its political representatives by voting them out of office. Therefore, some degree of voter ignorance appears to be a necessary assumption of theories explaining the policy bias. Such theories rely implicitly on voter illusion: Political incumbents can and do systematically fool a majority of voters by favoring special interests while keeping the costs imposed on the majority below some awareness threshold (Becker 1983, 391–4; Wilson 1980, 369).

Alternatively, under the assumption of voter rationality, the electorate can be thought of as ill informed (Downs 1957). If information gathering is costly, then a large portion of voters may not seek to learn about political alternatives that have the characteristic of being a collective good (possibly with differentiated benefits). The problem is exacerbated because the probability that a single vote—informed or not—makes a difference for the election outcome is usually very small.

The argument that the policy bias derives from rational voter ignorance has some surface plausibility but becomes unsustainable under further scrutiny. As a by-product of engaging in various social and economic activities in daily life, voters accumulate costless information about their personal wealth and well-being. Even if they are ill informed about policy details, they nonetheless know how well off they are, and they can base their vote on this knowledge. Indeed, one robust empirical regularity that holds across industrialized democracies is retrospective voting: Incumbents who preside over good economic performance tend to get reelected (Fiorina 1981). The literature on rational retrospective voting interprets such behavior as the result of rational inferences about the quality of polit-

ical representatives, formed on the basis of observed economic performance (Rogoff 1990; Rogoff and Sibert 1988).

In the face of retrospective voting, an incumbent must trade off gains and losses in political support that follow from favoring one group of voters rather than another. It is simply not obvious that an incumbent can generate a net gain in political support by catering to a well-informed minority at the expense of an ill-informed majority, especially if the total losses incurred by the general public exceed the total gains enjoyed by special interests. Such a policy bias reduces the welfare of a majority of voters and decreases the likelihood that they will vote for the incumbent. If economists are correct in identifying the huge deadweight losses associated with political handouts to special interests (*Economist* 1992; Hufbauer and Elliott 1994), then an incumbent who eradicates such inefficiencies will preside over an increase in the standard of living that will ensure reelection. An incumbent who is incompletely informed about voter preferences will have incentives to set policy in an unbiased and efficient way in order to maximize the welfare of his constituents and thereby maximize his reelection chances. If the incumbent is too short-sighted to follow this prescription, then political competition will allow society to break free from inefficient redistributive policies: A political entrepreneur who campaigns for Pareto-improving political reforms will be elected unanimously (Wittman 1989).

Of course, voters do obtain information not only about their personal wealth and well-being but also about the state of the economy and the quality of life in their society. Public opinion polls transmit information held by a subset of voters to the electorate at large (Bartels 1988; McKelvey and Ordeshook 1985). Interest groups and political candidates gather costly information and provide low-cost information cues to the general public. For example, interest groups monitor legislators' voting records and publish ratings, and challengers attack the legislative records of incumbents they seek to unseat (Lupia 1992). Once again, it is not obvious that an incumbent can afford to "shirk" by catering to a well-informed minority at the expense of a majority of voters if the latter are ill informed most of the time but in an election year "vote as if they had full information" (McKelvey and Ordeshook 1985, 57).

Building on Arnold (1990), I seek to undermine this Panglossian perspective on electoral competition, information, and shirking. First, in a complex world there is virtually an infinite amount of information competing for voters' attention. In the presence of some (possibly very small) cognitive cost of information processing, voters do not necessarily process information even if, by some measure, it is publicly available at no cost. We can expect political competition to work well in preventing an incumbent from acting against the interests of constituents only if an issue is salient in the public mind—or if it can be made salient in a future election by an interest group or a challenger; otherwise, incumbents can and do shirk.

For example, when price inflation was low, Congress supported sugar quotas that implied artificially high

sugar prices, enriching U.S. producers and (in effect) imposing a hidden sales tax on consumers. Neither price inflation nor sugar quotas were salient issues in the mind of the American voter. In 1974 and later in that decade, galloping price inflation figured prominently on the electoral agenda; Congress then repeatedly rejected bills to renew the sugar programs of the past. Sugar quotas themselves did not become electorally salient, but legislators feared a future challenger would make a campaign issue out of a vote that could easily be connected with higher prices (Arnold 1990, 123–5).

Second, the causal chain linking actions taken by an incumbent and policy effects experienced by constituents can be very complex. Interest groups and challengers may not be able to communicate effectively that an incumbent has acted against the interests of constituents. Once again, we can be satisfied that political competition will work well if the incumbent shirks in a way that can be described in a ten-second television “bite.” But in many cases voters lack specialized information to understand that the incumbent acted against their interests, and they cannot acquire this specialized information at low cost.

For example, it would be relatively easy for voters to understand how direct transfers improve the income of automobile workers, but some knowledge of politics and economics is necessary to understand how Congress and the president employ a “voluntary export restraint” to save jobs in the automobile industry at the expense of American consumers:

In February 1981, House Budget Committee Chairman James Jones announced that Congress would soon be voting to impose auto import quotas on Japan. In April, Sen. Bob Dole, chairman of the Senate Finance Committee, warned visiting Japanese legislators that Japan must either reduce its exports or face the wrath of Capitol Hill. President Reagan, “seeking to uphold free trade principles,” as the *New York Times* noted, indicated that his administration would not negotiate with Japan over any specific level of restraint. But Reagan also declared that he would welcome “voluntary” action by the Japanese government to reduce auto exports. Japan announced in late April 1981 that it would restrict auto exports to the U.S. (Bovard 1991, 93).

U.S. auto manufacturers subsequently enjoyed record profits. American consumers paid the bill: The voluntary export restraint on Japanese automobiles raised the average price of a new car by \$1,650 (Collins and Dunaway 1987, 159).

Campaign Contributions and Legislative Failure

Two other sources of the policy bias toward special interests have been identified in the literature. One explanation asserts that incumbents favor organized interests in exchange for campaign contributions (Baron 1994; Grossman and Helpman 1996). Another invokes “legislative failure,” that is, legislative norms or organization characteristics that are dysfunctional from

an aggregate welfare perspective.¹ The canonical story has members of Congress approve one another’s inefficient pork-barrel projects in quid-pro-quo logrolls (Weingast, Shepsle, and Johnsen 1981). Alternatively, “high demanders” are said to self-select onto powerful congressional committees that have jurisdiction over the pork-barrel projects that benefit their districts (Shepsle 1978).

There are limitations to the explanatory power of approaches that emphasize the role of monetary contributions made by interest groups or rely on specific features of Congress. The phenomenon to be explained—the policy bias toward special interests—is observed across many countries with different political processes and institutions. Inefficient forms of public policy are common not only in the United States but also in countries where monetary contributions to political candidates play an insignificant role, in some cases because campaigns are publicly financed. Similarly, pork-barrel politics is not restricted to the U.S. Congress; it also occurs in legislatures controlled by strong political parties that enforce majoritarian party-line voting rather than universalistic logrolls or deference to stacked committees.

AN INFORMATION RATIONALE

This article explains the policy bias toward special interests in a framework with rational, utility-maximizing agents. Two ingredients feed into the explanation: electoral competition and information asymmetries. The latter arise endogenously because of the Olsonian free-rider problem.

First, the theory is based on the assumption that agents are rational. This assumption allows voters to be ill informed, but it requires that they understand the nature of the game: Rational voters cannot be systematically fooled. Second, the theory demonstrates why incumbents can achieve a net gain in political support if they bias policy toward a well-informed minority at the expense of an ill-informed majority, even if the losses imposed on the general public exceed the gains enjoyed by special interests. Third, the underlying information asymmetry is derived endogenously and linked explicitly to the free-rider problem. Fourth, the theory is relatively simple and institution-free. It does not rely on specific features of political processes and institutions that govern any one policy issue or country, except for the one feature that modern democracies have in common: regular free elections in which a majority of the electorate can vote the incumbent government out of office. According to the principle of Occam’s Razor (entities should not be multiplied needlessly), a simple explanation is preferable to a more complex one that invokes idiosyncratic distortions.

I argue that special interests prevail because they are better able to monitor the incumbent’s activities than are diffuse interests. For example, farm households in

¹ Of course, we simply shift the problem when we invoke dysfunctional institutions to explain economic inefficiencies: It remains to be explained why Pareto-improving institutional change fails to occur.

developed countries are generally well informed about legislation dealing with agricultural price supports and subsidies, and they can assess fairly accurately whether and how their political representatives contributed to the passage of an agricultural bill or to the size of price supports and subsidies the bill promises to deliver. In contrast, the huge majority of nonfarm households is unlikely to know that an agricultural bill was passed at all, let alone its details or the contributions made by their political representatives. Members of the general public may well notice the decrease in their real disposable income caused by the increase in food prices and taxes, but they can assign political blame for the loss only very imprecisely. In developing countries, in contrast, it is the urban poor who are well aware of the (subsidized) price of bread and other basic foods, while the welfare of farmers depends on random shifts in the demand for and supply of agricultural products in domestic and international markets, which interact in complicated and opaque ways with actions taken by the government.

Because special interests are better able to monitor the quality of their political representation, incumbents have electoral incentives to bias policy toward special interests. By doing so, they can mimic an increase in quality of life for special interests at the expense of an apparent decrease in quality of life for the general public. Compared to the ill-informed majority, the well-informed minority places a higher weight on the possibility that the observed policy outcome is caused by the incumbent's action rather than other random factors. This difference arises because the signal extraction process of special interests has less confounding "noise." As a consequence, incumbents gain more political support among members of the minority than they lose among members of the majority.

The opportunistic behavior of incumbents creates competitive incentives for individuals to acquire better monitors of political performance. If the incentives to become informed are asymmetrical, then political outcomes will be biased in favor of the well informed at the expense of the ill informed. One source of asymmetry is costly information acquisition. Compared to the general public, special interests face a less severe free-rider problem because they are smaller in number and thus end up becoming better informed, with the result that they enjoy the fruits of the policy bias.

Offsetting that advantage are retrospective voting rules, which cause a welfare-improving selection bias. While elections create incentives for incumbents to follow suboptimal policies for reelection purposes, they also serve to get rid of low-quality incumbents. Incumbents of above-average quality are more likely to survive voter scrutiny and remain in office. Here, "quality" stands for some positive-valued attribute that has the potential to improve the well-being of the electorate when the candidate holds power. Examples are leadership skills, competence in forging legislative coalitions, economic or foreign policy expertise, effectiveness in dealing with corruption or government waste, and the ability to create a political environment that is conducive to economic growth.

THE FORMAL MODEL

Policy and Selection Biases

The model consists of N voters indexed $h = 1, \dots, N$, where $N \geq 3$ and is an odd number. The set of voters is denoted N . The electorate can be decomposed into two homogeneous groups, a majority whose M individual members are indexed by j , and a minority whose $N - M$ individual members are indexed by i , where $j = 1, \dots, M$, $i = M + 1, \dots, N$, and $(N + 1)/2 \leq M < N$. These two groups will also be referred to as the general public (majority, j) and the special interest (minority, i). The members of each group are homogeneous; the parameters that are common to all members of the majority and minority are indexed by J and I , respectively.

Each voter h desires the incumbent policymaker to take a favorable action, $\hat{a}_h$; the voter's utility decreases quadratically with the distance between the action taken by the policymaker, $a \in R$, and the voter's ideal point, $\hat{a}_h$. The general public's preferences over the policymaker's action conflict with those of the special interest: $\hat{a}_J \neq \hat{a}_I$.

Political candidates are characterized by a quality parameter, q , which is randomly drawn from a normal distribution with zero mean and strictly positive but finite variance, σ_q^2 . Voter utility increases with the incumbent's quality.² The majority and the minority thus have a common interest: to ensure that an incumbent of above-average quality sets policy.

In summary, voter h 's indirect utility in each period is equal to

$$U_h = -\frac{1}{2}(a - \hat{a}_h)^2 + q. \quad (1)$$

Neither the general public nor the special interest can directly observe the action taken by the incumbent; they also cannot directly observe candidate quality. The public can, however, form indirect and imperfect inferences about the incumbent's quality based on observed policy outcomes. Formally, I assume that each individual observes an individual-specific outcome of the policy process:

$$\Pi_h = -\frac{1}{2}(a - \hat{a}_h)^2 + q + p_h, \quad (2)$$

where p_h is an individual-specific process shock, which is randomly drawn from a normal distribution with zero mean and strictly positive but finite variance, $\sigma_{p,h}^2$. The individuals' process shocks are independently distributed. In a simple way, the process shock captures the random nature of the interaction of multiple (unmodelled) actors and circumstances that affect the outcome

² For analytical simplicity, candidate quality enters the utility function additively. For some interpretations of candidate quality, the separability of the policymaker's action and quality might be considered implausible. Alternatively, we could have the distance between the policymaker's action and the voters' ideal points depend on the unknown state of the world. High-quality candidates would have more accurate (lower variance) estimates of the state of the world than would low-quality candidates, with positive consequences for the voters' (quadratic) utilities. The qualitative results of the analysis are robust.

of complex political and economic processes and thus have an effect on voter utility.

In practice, special interests are better informed than is the general public: $\sigma_{p,J}^2 > \sigma_{p,I}^2$. They are better able to disentangle whether observed policy outcomes are caused by incumbent action, incumbent quality, or other random factors confounding their inferences. My analysis is not predicated, however, on the assumption that the minority group is better informed than the majority group. Instead, I first derive the equilibrium without specifying which group (if any) enjoys an information advantage: $\sigma_{p,J}^2 \geq \sigma_{p,I}^2$. Later the information asymmetry across groups is derived endogenously by assuming that each individual h can pay a cost, c_h , to lower the variance ($\sigma_{p,h}^2$) of her observation, Π_h .

Political candidates care about aggregate welfare and about holding power. Their indirect utility in each period is given by

$$\sum_{h=1}^N U_h + S, \quad (3)$$

where the sum of individual utilities stands for aggregate welfare, and the index variable S takes on the value $\bar{S}$ if the political candidate is in power in the period under consideration, the value zero otherwise, $\bar{S} \in (0, \infty)$. The parameter $\bar{S}$ captures the degree to which political candidates are office seeking: It is equal to zero if they are concerned only with aggregate welfare and goes to infinity as the (re)election goal becomes dominant.

The expression for aggregate welfare weighs the individual utilities equally. One distinguishing characteristic of special interests might be that they care more strongly about a certain policy issue than does the general public. This possibility is easily integrated into the model by having the incumbent weigh minority utility more heavily. The qualitative results of the analysis, which defines policy and selection biases relative to the benchmark outcome that maximizes aggregate welfare, are not affected; the benchmark would simply shift with higher weights on minority utility. Similarly, the assumption that the incumbent cares about aggregate welfare is not crucial. Alternatively, we might assume that the incumbent represents the majority group (in the sense of sharing its ideal point). The question, then, is to what extent the incumbent will disregard constituency interests and pander to the minority group to increase the chance of reelection.

Finally, I assume that candidates themselves are uncertain about their quality. One plausible interpretation of quality has both candidates and voters imperfectly informed about the fit between the candidates' known positions and the unknown characteristics of the political and economic environment. For example, candidates might differ in their ideology about the workings of the economy (Roemer 1994), in which case quality would stand for the objective accuracy of their ideology.

The assumption that incumbents are uncertain about

their quality at the time of setting policy serves an important analytical purpose (Lohmann 1998). It isolates the policy bias that arises because incumbents seek to pretend that their quality is higher than it truly is; confounding policy effects would arise if incumbents knew their own quality, but voters did not. In the latter case of asymmetric information, high-quality incumbents would set policy so as to separate themselves from types of lower quality, or low-quality incumbents would mimic the behavior of higher quality types (Rogoff 1990). By excluding such asymmetric information, I demonstrate that the policy bias arises because of the strategic interaction between incumbents and their voters, not because of the strategic interaction between different types of incumbents. The policy bias is driven by incumbents' desire to make voters believe they are of above-average quality, regardless of their actual quality, and not by their desire to separate themselves from lower quality types or mimic the behavior of higher quality types.

The model has two periods, indexed $t = 1, 2$. Supplement 1, available upon request, argues that my conclusions (policy and selection biases and retrospective voting) are robust in the presence of an infinite horizon. Time superscripts are omitted whenever possible to avoid notational clutter. For simplicity, I assume that second-period utilities are not discounted.

Figure 1 lists the sequence of events. In the first period, the incumbent takes an action, a . Then the incumbent's quality, q , and the individual-specific process shocks, $p_1, \dots, p_N$, are drawn. Voter h does not separately observe the incumbent's action and Nature's draws, only the policy outcome, Π_h , which is jointly determined by the policymaker's action and the quality and process shocks. Voter h then chooses whether to vote for the incumbent ($v_h = 1$) or the challenger ($v_h = 0$). The incumbent remains in power if he receives a majority of the vote, that is, at least $(N + 1)/2$ votes. Otherwise, he is replaced by a challenger. The election winner then takes an action, a . When a challenger wins, his q is a "fresh draw." Finally, the game ends, and the players' payoffs are realized.

The equilibrium concept is a refinement of perfect Bayesian Nash. Voters are restricted to use weakly undominated voting strategies. This refinement is invoked to eliminate implausible voting equilibria of the following kind. Suppose each voter believes that all other voters will vote for one candidate independently of their private information. This candidate will win the election for sure. As a consequence, each voter is indifferent between voting for or against this candidate, and she thus may choose to follow a pure strategy of voting for this candidate independently of her private information. Thus, one candidate may win the election even though it is common knowledge that a majority of voters expect to be better off if the other candidate wins.

Another complication arises in the voting setting analyzed here: the "swing voter's curse" (Feddersen and Pesendorfer 1996). Each voter has private information (the individual-specific realization of the policy outcome, Π_h) about a common value that affects the

FIGURE 1. Election Time Line

utility levels of all voters (the incumbent's quality, q). As a consequence, each individual has incentives to condition her vote on the information implied by her vote being decisive for the election outcome. Voter h 's voting decision is based on her posterior expectation about the incumbent's quality, $E(q|\Pi_h, \sum_{k \in N \setminus h} v_k = (N-1)/2)$, where E is an expectations operator. This expectation is conditioned not only on her private information, Π_h , but also on the information implied by exactly $(N-1)/2$ other individuals voting for the incumbent and $(N-1)/2$ other individuals voting for the challenger. (The swing voter's curse besets voters who fail to condition their vote on the information implied by their vote being decisive, analogous to the winner's curse, which besets auction bidders who fail to condition their bids on the information implied by their casting the winning bid.)

Here, I restrict attention to the case in which h votes solely based on her private information without taking into account the information implied by her casting the decisive vote. Supplement 2, available upon request, proves that my conclusions are robust with respect to the swing voter's curse.

DEFINITION. The unique perfect Bayesian Nash equilibrium, refined to rule out weakly dominated strategies, is given by the incumbent's first-period action, a_1^* ; the individuals' voting rule, $v_h^*(\Pi_h)$; and the election winner's second-period action, a_2^* . (The superscript * indexes equilibrium values.) The players' strategies are best responses. The voters use Bayes's rule to update their beliefs.

PROPOSITION 1. The unique perfect Bayesian Nash equilibrium, refined to rule out weakly dominated strategies, is given by the incumbent's biased first-period action,

$$a_1^* = \hat{a}_I \frac{M(1 + \phi_J \bar{S}\epsilon)}{N + M\phi_J \bar{S}\epsilon + (N-M)\phi_I \bar{S}\epsilon} + \hat{a}_I \frac{(N-M)(1 + \phi_I \bar{S}\epsilon)}{N + M\phi_J \bar{S}\epsilon + (N-M)\phi_I \bar{S}\epsilon}, \quad (4)$$

the voters' retrospective voting rule,

$$v_h^*(\Pi_h) = \begin{cases} 1 & \text{if } \Pi_h \geq -\frac{1}{2}(a_1^* - \hat{a}_h)^2 \\ 0 & \text{otherwise} \end{cases}, \quad (5)$$

and the election winner's unbiased second-period action,

$$a_2^* = \hat{a}_J \frac{M}{N} + \hat{a}_I \frac{N-M}{N}, \quad (6)$$

where $\phi_h \equiv f_h(0)$, f_h is the probability density function of $q + p_h$, and

$$\epsilon \equiv \frac{(N-1)!}{\left(\frac{N-1}{2}\right)! \left(\frac{N-1}{2}\right)!} \left(\frac{1}{2}\right)^{N-1}.$$

Proof. The model is solved by backward induction. In the second (and last) period of the game, there are no reelection incentives, so the election winner's action maximizes second-period aggregate welfare. His first-order condition is given by

$$\frac{d \left[E \sum_{h=1}^N U_h^{I=2}(a_2) + \bar{S} \right]}{da_2} = -M(a_2 - \hat{a}_J) - (N-M)(a_2 - \hat{a}_I) = 0. \quad (7)$$

His second-order condition is negative:

$$\frac{d^2 \left[E \sum_{h=1}^N U_h^{t=2}(a_2) + \bar{S} \right]}{(da_2)^2} = -N < 0. \quad (8)$$

It follows that the equilibrium second-period action, a_2^* , given in equation 6, is a weighted average of the two groups' ideal points, with the weights reflecting the groups' relative size.

At the end of the first period, each individual must decide whether to vote for the incumbent or the challenger. Her vote cannot ex post change her first-period utility—it can only influence her second-period utility. The voter supports the incumbent if she expects to be better off if he remains in power. Since the election winner's action is independent of who wins the election, the only difference between the two candidates lies in their expected qualities. The voter has no information (other than her prior beliefs) about the challenger's quality, which is zero in expectation. She cannot directly observe the incumbent's quality, but at the time of the vote she observes the individual-specific policy outcome. The voter supports the incumbent if his estimated q is greater than the expected q of the challenger, which is zero:

$$v_h = \begin{cases} 1 & \text{if } E(q|\Pi_h) \geq E(q) = 0 \\ 0 & \text{otherwise} \end{cases} \quad (9)$$

The estimate $E(q|\Pi_h)$ is derived using equation 2, which relates q and Π_h . There is no uncertainty about the first-period action, implying that $a_1 = a_1^*$ holds in equilibrium. It follows that equation 2 is equivalent to

$$q + p_h = \Pi_h + \frac{1}{2}(a_1^* - \hat{a}_h)^2. \quad (10)$$

Voter h cannot directly observe the individual components of the left-hand side of equation 10, q and p_h , but she knows that the sum $q + p_h$ is equal to the right-hand side of this equation. She is privately informed about the value of the first term on the right-hand side, Π_h ; the value of the second term, $\frac{1}{2}(a_1^* - \hat{a}_h)^2$, is not directly observed but is known in equilibrium. Her posterior estimate of the incumbent's quality, $E(q|\Pi_h)$, solves the standard signal extraction problem (DeGroot 1970, 167). The value $\Pi_h + \frac{1}{2}(a_1^* - \hat{a}_h)^2$ can be thought of as a random sample from a normal distribution with unknown mean q and variance σ_q^2 , where the prior distribution of the mean q is normal with mean zero and variance $\sigma_{p,h}^2$. Equation 10 thus implies that voter h 's posterior expectation of the incumbent's quality is a function of the observed policy outcome, Π_h :

$$E(q|\Pi_h) = \left(\frac{\sigma_q^2}{\sigma_q^2 + \sigma_{p,h}^2} \right) [\Pi_h + \frac{1}{2}(a_1^* - \hat{a}_h)^2]. \quad (11)$$

Equations 9 and 11 imply that h supports the incumbent if

$$\Pi_h + \frac{1}{2}(a_1^* - \hat{a}_h)^2 \geq 0. \quad (12)$$

The voter thus follows the equilibrium voting rule, v_h^* , given in equation 5.

In the first period, the incumbent trades off the first-period welfare and second-period reelection consequences of his action, a_1 . His first-order condition is given by

$$\begin{aligned} & \frac{d \left[E \sum_{h=1}^N U_h^{t=1}(a_1) + \bar{S} + E \sum_{h=1}^N U_h^{t=2} + \Pr(S = \bar{S}|a_1)\bar{S} \right]}{da_1} \\ & = -M(a_1 - \hat{a}_I) - (N - M)(a_1 - \hat{a}_I) \\ & \quad + \frac{d \Pr(S = \bar{S}|a_1)}{da_1} \bar{S} = 0, \end{aligned} \quad (13)$$

where $\Pr(S = \bar{S}|a_1)$ is the probability that the incumbent survives as a function of his action, a_1 . To examine how this survival probability varies with a_1 , I analyze how h 's vote is affected by a_1 :

$$\begin{aligned} \Pr(v_h = 1|a_1) &= \Pr[\Pi_h \geq -\frac{1}{2}(a_1^* - \hat{a}_h)^2] \\ &= \Pr[q + p_h \geq \frac{1}{2}(a_1 - \hat{a}_h)^2 - \frac{1}{2}(a_1^* - \hat{a}_h)^2] \\ &= 1 - F_h[\frac{1}{2}(a_1 - \hat{a}_h)^2 - \frac{1}{2}(a_1^* - \hat{a}_h)^2], \end{aligned} \quad (14)$$

where F_h is the cumulative distribution function of $q + p_h$. Taking as given the retrospective voting rule, the incumbent can influence the probability that h supports him:

$$\begin{aligned} \frac{d \Pr(v_h = 1|a_1)}{da_1} &= -(a_1 - \hat{a}_h)f_h[\frac{1}{2}(a_1 - \hat{a}_h)^2 \\ &\quad - \frac{1}{2}(a_1^* - \hat{a}_h)^2], \end{aligned} \quad (15)$$

where f_h is the probability density function of $q + p_h$. The incumbent's probability of survival is thus a function of his action, a_1 :

$$\begin{aligned} \frac{d \Pr(S = \bar{S}|a_1)}{da_1} &= -\epsilon M(a_1 - \hat{a}_I)f_I[\frac{1}{2}(a_1 - \hat{a}_I)^2 \\ &\quad - \frac{1}{2}(a_1^* - \hat{a}_I)^2] - \epsilon(N - M)(a_1 - \hat{a}_I)f_I[\frac{1}{2}(a_1 - \hat{a}_I)^2 \\ &\quad - \frac{1}{2}(a_1^* - \hat{a}_I)^2] = -\epsilon M(a_1 - \hat{a}_I)\phi_I \\ &\quad - \epsilon(N - M)(a_1 - \hat{a}_I)\phi_I, \end{aligned} \quad (16)$$

where $\phi_h \equiv f_h(0) = f_h(\frac{1}{2}(a_1 - \hat{a}_h)^2 - \frac{1}{2}(a_1^* - \hat{a}_h)^2)$, noting that $a_1 = a_1^*$ in equilibrium. The parameter ϵ is the probability that a given vote is decisive for the incumbent's survival. Individual h 's vote is decisive if exactly $(N - 1)/2$ voters choose the incumbent and the remaining $(N - 1)/2$ voters choose the challenger. In equilibrium the unconditional probability that h votes for the incumbent, $\Pr(v_h = 1)$, is equal to $1 - F_h(0)$, or one-half. Thus, the probability that her vote is decisive is equal to the binomial probability $b((N - 1)/2; N - 1, \frac{1}{2})$ that $N - 1$ Bernoulli trials result in $(N - 1)/2$ successes, with the probability of a success given by one-half, that is,

$$\frac{(N-1)!}{\left(\frac{N-1}{2}\right)! \left(\frac{N-1}{2}\right)!} \left(\frac{1}{2}\right)^{N-1}$$

The incumbent's first-order condition, equation 13, can now be rewritten as

$$\begin{aligned} & \frac{d \left[E \sum_{h=1}^N U_h^{t=1}(a_1) + \bar{S} + E \sum_{h=1}^N U_h^{t=2} + \Pr(S = \bar{S} | a_1) \bar{S} \right]}{da_1} \\ & = -M(a_1 - \hat{a}_I)(1 + \phi_I \bar{S} \varepsilon) \\ & - (N - M)(a_1 - \hat{a}_I)(1 + \phi_I \bar{S} \varepsilon) = 0. \quad (17) \end{aligned}$$

His second-order condition is negative:

$$\begin{aligned} & \frac{d^2 \left[E \sum_{h=1}^N U_h^{t=1}(a_1) + \bar{S} + E \sum_{h=1}^N U_h^{t=2} + \Pr(S = \bar{S} | a_1) \bar{S} \right]}{(da_1)^2} \\ & = -M(1 + \phi_I \bar{S} \varepsilon) - (N - M)(1 + \phi_I \bar{S} \varepsilon) < 0. \quad (18) \end{aligned}$$

The equilibrium first-period action, a_1^* , given in equation 4, follows. Supplement 3, available upon request, proves that the equilibrium is unique. *Q.E.D.*

Two features of the proof are worth highlighting. First, equation 11 contains the central intuition underlying the policy bias. The better informed is voter h , or the lower is the variance ($\sigma_{p,h}^2$) of the process shock (p_h) confounding her inferences, the higher is the weight she places on the observation Π_h , and the lower is the weight she places on her prior expectation of the incumbent's quality, that is, zero. The logic of the signal extraction problem drives the result that a well-informed voter reacts more sensitively to policy favors than does an ill-informed voter, which in turn creates incentives for the incumbent to grant such favors to well-informed voters at the expense of ill-informed voters.

Second, the voter in effect subtracts $\frac{1}{2}(a_1^* - \hat{a}_h)^2$ from the observed policy outcome Π_h , thereby rationally discounting the degree to which the policy outcome is favorable by the amount of the equilibrium policy bias. The incumbent cannot fool the voter: *In equilibrium* the incumbent's attempt to improve his reelection prospects is futile. The unconditional probability that h will support the incumbent's candidacy is equal to $1 - F_h(0)$, or one-half, implying that the incumbent's unconditional probability of survival is equal to

$$\Pr(S = \bar{S}) = \sum_{V=1}^{(N+1)/2} b\left(\frac{(N-1)}{2} + V; N, \frac{1}{2}\right) = \frac{1}{2}. \quad (19)$$

That the incumbent cannot systematically improve his reelection chances follows from the assumption of voter rationality: The voters' signal extraction problem takes into account the effect of the incumbent's manipulations on observed policy outcomes. Nonetheless, the

incumbent is trapped into producing a counterproductive policy bias because voters expect him to favor special interests. If he fails to satisfy their expectations, then he reduces his reelection chances to an unacceptable level. Thus, the voters' expectations are fulfilled in equilibrium.

PROPOSITION 2. *The policy bias is zero if there is no conflict of interest or information disparity between the majority and minority, or if the incumbent places zero weight on the reelection objective:*

$$a_1^* = a_2^* \text{ if } \hat{a}_J = \hat{a}_I, \text{ or if } \sigma_{p,J}^2 = \sigma_{p,I}^2, \text{ or if } \bar{S} = 0. \quad (20)$$

Otherwise, policy is biased toward the well-informed group at the expense of the ill-informed group:

$$\begin{aligned} & |a_1^* - \hat{a}_J| > |a_2^* - \hat{a}_J| \text{ and } |a_1^* - \hat{a}_I| \\ & < |a_2^* - \hat{a}_I| \text{ if } \sigma_{p,J}^2 > \sigma_{p,I}^2; \\ & |a_1^* - \hat{a}_J| < |a_2^* - \hat{a}_J| \text{ and } |a_1^* - \hat{a}_I| \\ & > |a_2^* - \hat{a}_I| \text{ if } \sigma_{p,J}^2 < \sigma_{p,I}^2. \quad (21) \end{aligned}$$

The size of the policy bias increases with the conflict of interest and the information disparity between the two groups and with the weight the incumbent places on the reelection objective:

$$\begin{aligned} & \text{sign} \left(\frac{d|a_1^* - a_2^*|}{d|\hat{a}_J - \hat{a}_I|} \right) = \text{sign} \left(\frac{d|a_1^* - a_2^*|}{d|\sigma_{p,J}^2 - \sigma_{p,I}^2|} \right) \\ & = \text{sign} \left(\frac{d|a_1^* - a_2^*|}{d\bar{S}} \right) > 0. \quad (22) \end{aligned}$$

Proof. The second-period action, a_2^* , which maximizes second-period aggregate welfare, serves as a normative benchmark. A policy bias is obtained if the action taken by an office-seeking incumbent in the first period, a_1^* , differs from this benchmark. The difference is given by

$$a_1^* - a_2^* = \frac{M(N - M)(\hat{a}_J - \hat{a}_I)(\phi_J - \phi_I)\bar{S}\varepsilon}{N + M\phi_J\bar{S}\varepsilon + (N - M)\phi_I\bar{S}\varepsilon}. \quad (23)$$

The conditions under which there is no policy bias, listed in equation 20, follow directly from equation 23, noting that $\phi_J = \phi_I$ is equivalent to $\sigma_{p,J}^2 = \sigma_{p,I}^2$. If none of the conditions in equation 20 are fulfilled, then the incumbent systematically favors the group that is better able to monitor his performance. The conditions determining the direction of the policy bias, listed in equation 21, follow immediately from equation 23; that is, if $\phi_J < \phi_I$ or, equivalently, $\sigma_{p,J}^2 > \sigma_{p,I}^2$, then $\hat{a}_J > \hat{a}_I$ implies $a_1^* < a_2^*$ and $\hat{a}_J < \hat{a}_I$ implies $a_1^* > a_2^*$; and vice versa. The comparative statics listed in equation 22 also follow straightforwardly from equation 23, noting that $|\phi_J - \phi_I|$ is strictly increasing in $|\sigma_{p,J}^2 - \sigma_{p,I}^2|$. (To make sense of this proof, it is useful to recall that $\phi_h \equiv f_h(0)$ is inversely correlated with $\sigma_{p,h}^2$, the variance of the normal density f_h .) *Q.E.D.*

These results demonstrate that the policy bias, $a_1^* \neq a_2^*$, is driven by the conflict of interest, $\hat{a}_I \neq \hat{a}_J$, the information disparity between the majority and minority, $\sigma_{p,J}^2 \neq \sigma_{p,I}^2$, and the incumbent's reelection objective, $\bar{S} > 0$. It is interesting to note that the *direction* of the policy bias depends only on the information disparity between the two groups, while the *size* of the policy bias depends on the conflict of interest and the information disparity between the two groups as well as the weight the incumbent places on the reelection objective.

PROPOSITION 3. *The probability that the incumbent survives the election increases with his quality:*

$$\frac{d \Pr(S = \bar{S}|q)}{dq} > 0. \quad (24)$$

As a result, the expectation of the incumbent's quality conditional on survival is strictly positive:

$$E(q|S = \bar{S}) > 0. \quad (25)$$

The size of this selection bias increases with the degree to which each voter is informed:

$$\frac{dE(q|S = \bar{S})}{d(\sigma_{p,h}^2)} < 0. \quad (26)$$

Proof. Compared with an incumbent of low quality, a high-quality type has better reelection chances because voters are more likely to experience favorable policy outcomes. Formally, equation 24 follows from

$$\begin{aligned} \frac{d \Pr(S = \bar{S}|q)}{dq} &= \varepsilon \sum_{h=1}^N \left[\frac{d \Pr(v_h = 1|q)}{dq} \right] \\ &= \varepsilon \sum_{h=1}^N \left[\frac{d \Pr[\Pi_h \geq -\frac{1}{2}(a_1^* - \hat{a}_h)^2|q]}{dq} \right] \\ &= \varepsilon \sum_{h=1}^N \left[\frac{d \Pr(p_h \geq -q)}{dq} \right] = \varepsilon \sum_{h=1}^N \left[\frac{d[1 - G_h(-q)]}{dq} \right] \\ &= \varepsilon \sum_{h=1}^N [g_h(-q)] > 0, \end{aligned} \quad (27)$$

where G_h is the cumulative distribution function of p_h , and g_h is the probability density function.

A political survivor—a reelected incumbent—tends to be of above-average quality. Formally, equation 28 can be rewritten as

$$E\left(q \mid \sum_{h=1}^N v_h \geq \frac{N+1}{2}\right) > 0, \quad (28)$$

which holds if

$$\Pr(q \geq 0|v_h = 1) > \Pr(q < 0|v_h = 1). \quad (29)$$

Applying Bayes's rule, the expressions on the left- and right-hand sides of equation 29 can be rewritten as

$$\begin{aligned} &\Pr(q \geq 0|v_h = 1) \\ &= \frac{\Pr(v_h = 1|q \geq 0) \Pr(q \geq 0)}{\Pr(v_h = 1|q \geq 0) \Pr(q \geq 0) + \Pr(v_h = 1|q < 0) \Pr(q < 0)}, \end{aligned} \quad (30)$$

$$\begin{aligned} &\Pr(q < 0|v_h = 1) \\ &= \frac{\Pr(v_h = 1|q < 0) \Pr(q < 0)}{\Pr(v_h = 1|q \geq 0) \Pr(q \geq 0) + \Pr(v_h = 1|q < 0) \Pr(q < 0)}. \end{aligned} \quad (31)$$

Noting that $\Pr(q \geq 0) = \Pr(q < 0)$, equations 30 and 31 imply that the inequality in equation 29 holds if

$$\Pr(v_h = 1|q \geq 0) > \Pr(v_h = 1|q < 0). \quad (32)$$

Noting that $\Pr(v_h = 1|q) = 1 - G_h(q)$, equation 32 is equivalent to

$$G_h(-q|q \geq 0) < G_h(-q|q < 0). \quad (33)$$

This establishes the validity of equation 25.

A better informed voter can more readily disentangle the effects of candidate quality and other random factors on observed policy outcomes. Formally, equation 26 holds if

$$\frac{d[\Pr(q \geq 0|v_h = 1) - \Pr(q < 0|v_h = 1)]}{d(\sigma_{p,h}^2)} < 0. \quad (34)$$

Noting that $[\Pr(q \geq 0|v_h = 1) - \Pr(q < 0|v_h = 1)]$ is strictly increasing in $[\Pr(v_h = 1|q \geq 0) - \Pr(v_h = 1|q < 0)]$ (see equations 30 and 31) and that $\Pr(v_h = 1|q) = 1 - G_h(q)$, the inequality in equation 34 holds since

$$\begin{aligned} &\frac{d[\Pr(v_h = 1|q \geq 0) - \Pr(v_h = 1|q < 0)]}{d(\sigma_{p,h}^2)} \\ &= \frac{d[G_h(-q|q < 0) - G_h(-q|q \geq 0)]}{d(\sigma_{p,h}^2)} < 0, \end{aligned} \quad (35)$$

noting that $\sigma_{p,h}^2$ is the variance of the probability density function g_h . Q.E.D.

PROPOSITION 4. *The policy bias reduces first-period expected aggregate welfare, and the selection bias increases second-period expected aggregate welfare:*

$$\begin{aligned} &E \sum_{h=1}^N U_h^{t=2} - E \sum_{h=1}^N U_h^{t=1} \\ &= \frac{\frac{1}{2}(\hat{a}_J - \hat{a}_I)^2(\phi_J - \phi_I)^2 \bar{S}^2 \varepsilon^2 M(N-M)}{N[M(1 + \phi_J \bar{S} \varepsilon) + (N-M)(1 + \phi_I \bar{S} \varepsilon)]^2} \\ &\quad + \frac{1}{2} E(q|S = \bar{S})N. \end{aligned} \quad (36)$$

Proof. First-period expected welfare is given by

$$E \sum_{h=1}^N U_h^{t=1} = -\frac{1}{2} (\hat{a}_J - \hat{a}_I)^2$$

$$\frac{M(N-M)[M(1 + \phi_J \bar{S}\epsilon)^2 + (N-M)(1 + \phi_I \bar{S}\epsilon)^2]}{[M(1 + \phi_J \bar{S}\epsilon) + (N-M)(1 + \phi_I \bar{S}\epsilon)]^2}, \quad (37)$$

and second-period expected welfare is given by

$$E \sum_{h=1}^N U_h^{t=2} = -\frac{1}{2} (\hat{a}_J - \hat{a}_I)^2 \frac{M(N-M)}{N}$$

$$+ \frac{1}{2} E(q|S = \bar{S})N. \quad (38)$$

In the first period there is no potential for a selection bias, only for a policy bias. The expression $-\frac{1}{2} (\hat{a}_J - \hat{a}_I)^2 M(N-M)/N$, which reflects second-period expected welfare minus the expected gains from the selection bias, serves as a normative benchmark that allows us to assess the welfare costs of the first-period policy bias. The first term in equation 38 is equal to the difference between this benchmark and first-period expected welfare. The difference is strictly positive, implying that the policy bias is associated with a welfare loss.

In the second period, there is no potential for a policy bias, only for a selection bias. The second term in equation 38 is equal to the difference between second-period welfare and the benchmark. The difference is strictly positive, implying that the selection bias increases second-period expected welfare. *Q.E.D.*

The voters' retrospective voting rules thus cause a welfare-reducing policy bias and a welfare-improving selection bias. While elections create incentives for incumbents to follow suboptimal policies for reelection purposes, they also serve to get rid of low-quality candidates.

Group Size and Endogenous Information Asymmetries

The results presented so far are based on an exogenously given information disparity between the majority and minority. My analysis is not, however, predicated on the assumption that the members of the minority group are better informed than are the members of the majority group. If, for reasons exogenous to my theory, the majority happens to be better informed, then my theory would imply that policy will be biased in favor of the majority.

This section endogenizes the information asymmetry by examining the incentives of the members of each group to become informed or, equivalently, to acquire a lower-variance monitor of political performance at a cost privately incurred by each individual. Each voter chooses how many resources to invest in gathering information. (Alternatively, we might think of voters as

inhabiting a complex world in which there is virtually an infinite amount of information competing for their attention. In the presence of some, possibly small, cognitive cost of information processing, voters must choose how much costly attention to pay to political information.)

By becoming better informed, the individual achieves two ends. First, she biases policy in favor of her group or contributes toward undoing a policy bias favoring the other group. Second, she improves the selection bias.

The private cost of information gathering in conjunction with the collective implications of the policy and selection biases imply that the individuals' information-gathering decisions are subject to a free-rider problem. This problem is conceptually more complicated than the standard free-rider problem. A within-group free-rider problem is nested in a free-rider problem shared by the entire electorate. With regard to the policy bias, each individual has goals in common with one group of individuals, whereas her goals conflict with those of the other group. A free-rider problem arises because she would prefer other members of her group to bear the costs of information gathering. Yet, she has competitive incentives to gather information so as to undo the effect of the information investments made by the opposing group. With regard to the selection bias, both groups have a common goal: to gather information in order to increase the expected quality of the future incumbent. This collective enterprise is subject to a free-rider problem common to all voters.

Given the importance of group size in standard analyses of the free-rider problem (Olson 1965), it is clearly of interest to examine the degree to which a group is able to overcome this problem as a function of its size. I analyze whether asymmetries in group size translate into an information disparity that in turn causes a policy bias. From a welfare perspective, I examine whether information is under- or oversupplied in equilibrium.

At a stage prior to the game analyzed earlier, voter h decides whether to acquire costly information (see Figure 1). Her choice variable is the private cost of information gathering, c_h , which enters additively into her utility function. The aggregate costs of information acquisition affect the utility function of political candidates who care about aggregate welfare. Because the information costs are sunk at the time of the first-period incumbent's and the election winner's decisions, their equilibrium strategies are not affected.

I now turn to the specification of the information-gathering technology. For an individual h who remains totally uninformed, the variance ($\sigma_{p,h}^2$) of the process shock (p_h) approaches infinity. As the voter gathers more information, the variance decreases, with decreasing marginal returns from information gathering, and goes to zero as the individual becomes fully informed. It is useful to specify the information-gathering technology in terms of the parameter $\phi_h \equiv f_h(0)$, which is inversely correlated with $\sigma_{p,h}^2$; ϕ_h ranges from one to zero as $\sigma_{p,h}^2$ varies from zero to infinity.

For the sake of concreteness, I assume a specific functional form:

$$\phi_h = \sqrt{c_h}, \quad (39)$$

where $c_h \in [0, 1]$; the endpoints of the unit interval correspond to the cases in which voter h remains uninformed and in which she becomes perfectly informed, respectively. Formally, the assumption of positive but diminishing marginal returns from information gathering is reflected in the signs of the first and second derivatives:

$$\frac{d\phi_h}{dc_h} = \frac{1}{2\sqrt{c_h}} > 0; \quad \frac{d^2\phi_h}{(dc_h)^2} = -\frac{1}{4\sqrt{c_h}} < 0. \quad (40)$$

PROPOSITION 5. *All individuals become partially informed, but each member of the minority invests more resources in information gathering than does each member of the majority:*

$$0 < c_j^* < c_i^* < 1. \quad (41)$$

Proof. The proof makes use of the individual indices, $j = 1, \dots, M$ and $i = M + 1, \dots, N$, even though in equilibrium the members of a given group invest identical resources in information gathering. The reason is that each individual takes as given the equilibrium amount of information purchased by all other individuals, including the members of her own group.

Individual j chooses the cost, c_j , that maximizes her two-period expected utility:

$$\begin{aligned} & -c_j + EU_j^{t=1}(\phi_j(c_j)) + EU_j^{t=2}(\phi_j(c_j)) \\ & = -c_j - \frac{1}{2}(\hat{a}_j - \hat{a}_I)^2 \\ & \quad \frac{(N-M)^2(1 + \phi_I \bar{S}\epsilon)^2}{[N + \phi_j \bar{S}\epsilon + (M-1)\phi_I \bar{S}\epsilon + (N-M)\phi_I \bar{S}\epsilon]^2} \\ & \quad - \frac{1}{2}(\hat{a}_j - \hat{a}_I)^2 \frac{(N-M)^2}{N^2} + \frac{1}{2}E(q|S = \bar{S}). \end{aligned} \quad (42)$$

Her first-order condition is given by

$$\begin{aligned} & \frac{d[-c_j + EU_j^{t=1}(\phi_j(c_j)) + EU_j^{t=2}(\phi_j(c_j))]}{dc_j} \\ & = -1 + \frac{\partial EU_j^{t=1}}{\partial \phi_j} \frac{\partial \phi_j}{\partial c_j} + \frac{1}{2} \frac{\partial E(q|S = \bar{S})}{\partial \phi_j} \frac{\partial \phi_j}{\partial c_j} \\ & = -1 \\ & \quad + \frac{(\hat{a}_j - \hat{a}_I)^2(N-M)^2(1 + \phi_I \bar{S}\epsilon)^2 \bar{S}\epsilon}{[N + \phi_j \bar{S}\epsilon + (M-1)\phi_I \bar{S}\epsilon + (N-M)\phi_I \bar{S}\epsilon]^3} \\ & \quad + \frac{1}{2\sqrt{c_j}} + \frac{1}{2} \frac{\partial E(q|S = \bar{S})}{\partial \phi_j} \frac{1}{2\sqrt{c_j}} = 0. \end{aligned} \quad (43)$$

Substituting equation 39 into equation 43, and noting that $\phi_j = \phi_I$ and $\phi_i = \phi_I$ in equilibrium, equation 43 can be rewritten as

$$\begin{aligned} & -1 + \frac{1}{2\phi_I} \frac{(\hat{a}_j - \hat{a}_I)^2(N-M)^2(1 + \phi_I \bar{S}\epsilon)^2 \bar{S}\epsilon}{[N + M\phi_I \bar{S}\epsilon + (N-M)\phi_I \bar{S}\epsilon]^3} \\ & \quad + \frac{1}{4\phi_I} \frac{\partial E(q|S = \bar{S})}{\partial \phi_j} = 0. \end{aligned} \quad (44)$$

The corresponding equilibrium first-order condition for an individual of type I is given by

$$\begin{aligned} & -1 + \frac{1}{2\phi_I} \frac{(\hat{a}_j - \hat{a}_I)^2 M^2(1 + \phi_I \bar{S}\epsilon)^2 \bar{S}\epsilon}{[N + M\phi_I \bar{S}\epsilon + (N-M)\phi_I \bar{S}\epsilon]^3} \\ & \quad + \frac{1}{4\phi_I} \frac{\partial E(q|S = \bar{S})}{\partial \phi_i} = 0. \end{aligned} \quad (45)$$

Substituting equation 44 into equation 45 and simplifying, the following equation obtains:

$$\begin{aligned} & \frac{(\hat{a}_j - \hat{a}_I)^2 \bar{S}\epsilon}{[N + M\phi_I \bar{S}\epsilon + (N-M)\phi_I \bar{S}\epsilon]^3} \\ & \quad [\phi_I(N-M)^2(1 + \phi_I \bar{S}\epsilon)^2 - \phi_I M^2(1 + \phi_I \bar{S}\epsilon)^2] \\ & \quad = (\phi_I - \phi_I) \frac{1}{2} \frac{\partial E(q|S = \bar{S})}{\partial \phi_h}. \end{aligned} \quad (46)$$

Equation 46 is consistent with exactly one of the following three cases: (1) $M > N - M$ implies $\phi_j = \phi_I$; or (2) $M > N - M$ implies $\phi_j > \phi_I$; or (3) $M > N - M$ implies $\phi_j < \phi_I$. Case 1 contradicts the equality sign in equation 46: $M > N - M$ and $\phi_j = \phi_I$ imply that the left-hand side of equation 46 is strictly negative, while $\phi_j = \phi_I$ implies that the right-hand side is zero. Case 2 also contradicts the equality sign: $M > N - M$ and $\phi_j > \phi_I$ imply that the left-hand side is strictly negative, while $\phi_j > \phi_I$ implies that the right-hand side is strictly positive. It follows that the only case consistent with equation 46 is case 3. Moreover, the assumption of diminishing marginal returns from costly information gathering (see equation 40) eliminates corner solutions, that is, $\phi_j = \phi_I = 0$ or $\phi_j = \phi_I = 1$. It follows that $0 < c_j^* < c_I^* < 1$, as stated in equation 41. Supplement 3, available upon request, shows that the uniqueness-of-equilibrium result continues to hold when the equilibrium play characterized earlier is preceded by an information-gathering stage as specified above. *Q.E.D.*

It is worthwhile highlighting that proposition 5 does not imply that the minority group as a whole gathers more information than does the majority group as a whole, nor does it exclude this possibility. Proposition 5 does imply that the information asymmetry $\sigma_{p,I}^2 < \sigma_{p,j}^2$ arises endogenously as a result of special interests being smaller in number than the general public. Along with proposition 1, this implies that policy will be biased toward the minority at the expense of the majority.

PROPOSITION 6. *As the majority increases in size relative to the minority, each member of the majority invests less resources, each member of the minority more resources, in information gathering:*

$$\frac{dc_j^*}{dM} < 0, \quad \frac{dc_i^*}{dM} > 0 \quad \text{for fixed } N. \quad (47)$$

Proof. Equation 47 follows immediately from equation 46, noting that $\phi_h = \sqrt{c_h}$. For fixed N , the case in which an increase in M leads to a decrease in ϕ_j and an increase in ϕ_i is the only case consistent with the equality sign. *Q.E.D.*

There are three reasons a decrease in the relative size of the minority strengthens the minority's, and weakens the majority's, incentives to gather costly information. First, the within-group free-rider problem becomes less severe for the minority, more severe for the majority. Second, the competitive pressures to invest in information so as to offset the information investments made by the other side increase for the minority, which now has fewer members to make such investments, and decrease for the majority, which has more members. Third, the incumbent, who cares not only about reelection but also about aggregate welfare, now places less weight on minority welfare and more weight on majority welfare; the benchmark policy absent differential information investments now becomes more disadvantageous for the minority and more advantageous for the majority. This shift in the benchmark strengthens the minority's, and weakens the majority's, incentives.

The information asymmetry between the special interest and the general public, and thus the policy bias, attains a maximum when the special interest is a single individual ($M = N - 1$) and a minimum when the special interest and the general public are approximately equal in number ($M = (N + 1)/2$). Recall, however, that the policy bias is defined relative to a benchmark that shifts with the number of individuals in each group. In the $M = N - 1$ case, the benchmark policy lies close to the majority's ideal point; in the $M = (N + 1)/2$ case, it lies approximately midway between the ideal points of the two groups. Thus, the comparative statics relating the relative size of the minority group to the size of the information asymmetry and of the policy bias do not translate directly into comparative statics about the location of the equilibrium policy relative to the majority's and minority's ideal points.

PROPOSITION 7. *From an aggregate welfare perspective, information investments driven by the policy bias are oversupplied, while those driven by the selection bias are undersupplied by a factor of N . The net effect is ambiguous:*

$$c_h^* \geq c^W, \quad (48)$$

where c^W is the welfare-maximizing value of c_h .

Proof. Proposition 4 implies that information-gathering efforts driven by the policy bias lead to a welfare loss. From a welfare perspective, the voters should collect zero information for the purpose of influencing the policy bias. Thus, the deadweight cost of information gathering privately incurred by each individual

must be traded off only against the collective gains generated by the resulting increase in the selection bias. Moreover, from a welfare perspective, because of diminishing returns of information gathering, it is optimal for all individuals to be equally well informed: the welfare-maximizing value of c_h , c^W , is identical for all h . This value solves the first-order condition:

$$\begin{aligned} & d \left[-c_h + E \sum_{h=1}^N U_h^{t=1}(\phi_h(c_h)) + E \sum_{h=1}^N U_h^{t=2}(\phi_h(c_h)) \right] \\ & \quad \quad \quad dc_h \\ & = -1 + 0 + \frac{N}{4\sqrt{c_h}} \frac{\partial E(q|S = \bar{S})}{\partial \phi_h} \\ & = -1 + \frac{N}{4\phi_h} \frac{\partial E(q|S = \bar{S})}{\partial \phi_h} = 0, \end{aligned} \quad (49)$$

where $\phi^W = \sqrt{c^W}$. A comparison of first-order condition 49 with the equilibrium first-order conditions 44 and 45 shows that, in equilibrium, information investments driven by the counterproductive policy bias are oversupplied independent of their size. In contrast, information-gathering efforts driven by the selection bias are undersupplied by a factor of N . The comparison of equations 49, 44, and 45 shows that the net effect is ambiguous. *Q.E.D.*

The result that information may be oversupplied is interesting insofar as it contradicts the standard intuition according to which voluntary and costly contributions to a public good will be suboptimally low. The possibility of oversupply arises because each group has a competitive incentive to outdo the other's information-gathering efforts so as to create a policy bias in their favor. The undersupply of information gathering geared toward the selection bias, by a factor of N , reflects the standard free-rider problem shared by an electorate of size N .

INFORMAL OUTLINE OF THE ARGUMENT

My analysis develops a precise intuition explaining why an incumbent can achieve a net gain in political support when he biases policy toward a minority of voters at the expense of a majority, even if the losses incurred by the general public exceed the gains enjoyed by special interests. Each voter would like to reelect an incumbent of above-average quality, but she cannot fully disentangle the contribution of the incumbent's quality and other forces driving the observed policy outcome. She may experience a favorable policy outcome because the incumbent is a high-quality candidate, because policy is biased in her favor, or because she is lucky. Based on the observed policy outcome, the voter forms an inference about the incumbent's quality. She does so by solving a signal extraction problem that assigns weights to various factors that influence the observed policy outcome, where the weight placed on any one factor decreases with the degree of uncertainty associated with the factor. If the observed outcome is

sufficiently favorable, the voter casts her vote for the incumbent; otherwise she votes for the challenger. The incumbent can mimic an increase in quality vis-à-vis special interests by biasing policy in their favor, at the expense of an apparent decrease in quality vis-à-vis the general public. Compared to the ill-informed majority, the well-informed minority places a higher weight on the possibility that the observed policy outcome is caused by the incumbent's quality. This is because their signal extraction problem is subject to less "noise" confounding their inferences. As a consequence, the incumbent gains more political support among members of the minority than he loses among members of the majority. By continuity, this argument holds even if the policy bias is associated with some inefficiency. The size of the policy bias increases with the information asymmetry between the special interest and the general public.

So far, my theory does not necessarily imply that policy is biased toward special interests. If, for reasons exogenous to the theory, the majority happens to be better informed than the minority, then my theory is consistent with a majoritarian bias. My theory does allow for the possibility that the information asymmetry arises endogenously as a result of individual decisions to gather costly political information (or pay costly attention to political information). The voters' anticipation of policy and selection biases creates incentives to acquire better monitors of political performance. The private costs of information acquisition in conjunction with the collective consequences of policy and selection biases imply that the voters' information-gathering efforts are subject to a free-rider problem. With regard to the policy bias, each individual would prefer other members of her group to bear the costs of information gathering, but she also has competitive incentives to gather information in order to offset the information investments made by the opposing group. Asymmetries in group size translate into an information disparity which in turn causes a counterproductive policy bias: The smaller is the minority relative to the majority, the larger is the bias. From a welfare perspective, information is oversupplied in equilibrium to the extent that the voters' information-gathering efforts are primarily driven by the counterproductive policy bias. With regard to the selection bias, all voters have incentives to become better informed in order to improve the expected quality of the future incumbent. This collective enterprise is subject to the standard free-rider problem. Information is undersupplied in equilibrium to the extent that information acquisition is primarily driven by the selection bias.

EVIDENCE

My theory generates a host of empirical implications, of which three stand out. First, policy is biased in favor of well-informed voters at the expense of ill-informed voters. To the extent that the information asymmetry arises endogenously as a result of individual decisions to gather costly information, special interests, being smaller in number, end up better informed than the

general public. Second, elections give rise to selection effects on the quality of political representatives. Re-elected incumbents tend to be of higher quality than defeated incumbents or the average challenger. Third, voters vote retrospectively, supporting the incumbent, if they experience good policy outcomes, or the challenger, if they experience bad policy outcomes.

Here, I compare the implications of the theory to existing empirical findings and discuss how they might be tested empirically.

Policy Bias

Standard political business cycle theory predicts a policy bias in aggregate economic variables: Incumbents seeking reelection try to manipulate the instruments of economic policy so as to improve the state of the economy before elections (Nordhaus 1975; Rogoff 1990; Rogoff and Sibert 1988). This hypothesis enjoys a strong hold on the scholarly imagination, even though its empirical record is remarkably poor (Alt and Chrystal 1983). Implicitly or explicitly, the standard theory models the electorate as a unitary actor; by construction, it does not allow for a distributional policy bias. My theory suggests that we should be looking for evidence of preelection effects on redistribution rather than the aggregate economy. For example, Keech and Pak (1989) find an electoral cycle in U.S. veterans' benefits between 1961 and 1978. After 1979, when benefits were indexed to fluctuate automatically with the consumer price index, the cycle disappeared.

There exists abundant anecdotal evidence about preelection handouts to special interests. One month before the 1996 presidential election, the Clinton administration pressured Mexico to adopt a voluntary export restraint that would end the shipment of low-price tomatoes to the United States. The deal provided relief to tomato growers in a swing state, Florida, at the expense of tomato consumers all over the United States (Sanger 1996). Clinton followed a path well trodden by his predecessor. Four years earlier, Bush had traveled the land distributing favors to pivotal groups: In South Dakota, he awarded \$1 billion in subsidies to boost local grain exports; in Texas, he announced approval of a sale of \$4 billion in F-16 fighters to Taiwan, which would guarantee thousands of jobs at the Fort Worth plant of General Dynamics, the aircraft's manufacturer; in Missouri, Bush gave the go-ahead for a long-stalled sale of \$5 billion in F-15 aircraft to Saudi Arabia, which would preserve local McDonnell-Douglas jobs (Cornwell 1992). This kind of "surgical" redistribution, which is carefully tailored to a narrow slice of voters at the expense of the American consumer or taxpayer, may well fail to make a statistically significant dent in aggregate measures of protectionism or government spending.

Moving beyond anecdotal evidence, my theory can be tested with a time-series analysis linking the direction and size of redistributional flows between two groups to asymmetries in the relative levels of political information held by the two groups. Consider, for example, the intergenerational distributional conflict

between the minority of retired older people and the majority of working younger people in the United States. The standard tyranny-of-the-majority argument would imply a policy bias favoring the young at the expense of the old. But by some measures the old are doing well compared to the young:

Since 1973, the real median income of households headed by adults aged sixty-five and over has risen by over 25 percent, while the real median income of households under thirty-five has fallen by over 10 percent. Counting all sources of income, poverty is three times as likely to afflict the very young as the very old. . . . Per capita federal benefits to the elderly tower twelve to one over benefits to children (Petersen 1996, 142–3).

My theory implies that the federal largesse enjoyed by the old at the expense of the young will vary over time with the degree to which older people are relatively better informed about the activities of elected politicians.

To test this hypothesis, it is necessary to construct empirical measures of the redistributive flows from the young to the old and of the relative levels of political information held by the young and the old. Since these redistributive flows take on the complex form of Social Security and Medicare payments rather than the simple form of direct transfers, their measurement is not straightforward. Standard measures of political information reflect the percentage of respondents who can name their representatives in Congress or accurately position the president and various members of Congress in the “ideological” left-right spectrum. These empirical measures capture my theoretical construct only approximately.

It is also necessary to construct adequate controls for confounding factors so as to disentangle the relative explanatory power of my informational theory and other theories, competing and complementary, that identify economic and political forces shaping the redistributive flows from the young to the old. Economic theory emphasizes as important the relative number of older and younger people, or how many working people support one retiree on average, as well as the output and incentive constraints that define the “possibility frontier” for redistributing income and wealth across these two groups. Political science identifies as important the relative number of older and younger voters, with problems of collective action and the idiosyncracies of political institutions implying different “weights” for younger and older voters. The political power of the old derives from multiple sources. In the modern era, more and more people are living longer, implying that the ratio of older to younger voters is increasing; older people have higher electoral participation rates than do the young; they are better organized, namely, in the American Association of Retired Persons (AARP); they interact more frequently with members of Congress visiting their home district; and they are more likely to reside in a swing state in presidential elections (Florida) (Conway 1991, chapter 2; Roberts 1994, chapter 12).

Older voters are also favored in the game of redis-

tributive politics because they place high weight on “selfish” (pocketbook) issues and low weight on “ideological” (policy) issues and because their policy positions are distributed around the political center. It thus makes sense for office seekers to “buy” the elderly vote by redistributing income to the old, while “paying off” in ideological currency those voters who place high weight on ideological issues and have extremist policy positions (Dixit and Londregan 1996).

I argue that the political power of older people comes about because they are relatively well informed, especially on issues with important consequences for their wealth and well-being.³ Of two citizens who are otherwise equally well informed about politics and public policy, the citizen over age 64 is more likely to recall news about health insurance than are younger people (Price and Zaller 1993, 156).

Not only do older people have more leisure time to acquire information (that is, for reasons exogenous to my model, they have lower costs of gathering information), but also they receive more information as a result of being better organized. Older people who join the AARP because of the discounts and services it offers receive as a costless by-product of their membership the monthly newsletter, *AARP Bulletin*, and the bi-monthly magazine, *Modern Maturity*. These two communications provide information about the activities of elected politicians, the issue positions of competing political candidates, members’ legal rights and entitlements vis-à-vis the government, and the like. The AARP also brings together elected politicians and senior citizens and distributes information about these meetings to members.

Selection Bias

Zaller’s (1998) Monte Carlo simulation of congressional career paths provides indirect evidence for the view that elections weed out low-quality candidates. Two initial candidates are assigned “skill” and “luck” scores through random draws from a lottery. The candidate with the higher net score of skill and luck wins the contest and takes on new challengers, who are “fresh draws.” Successful candidates keep their skill level throughout their career, but there is a fresh draw of luck for each new contest. Zaller analyzes the patterns of wins and losses and compares the resulting “careers” to actual congressional data. The simulated and empirical data fit on several important dimensions: overall reelection rates, sophomore surges, ten-term survival rates, term-by-term increases in performance,

³ On a tangential note, it is worth mentioning that the political information and participation levels of older people are anomalous. Americans over age 65 are less active in the labor market (they are mostly retired) and less educated than younger generations, and they are disproportionately female (men have a shorter life expectancy). Given the standard empirical correlations between labor market participation, education, and gender, on the one hand, and political information and participation levels, on the other (Conway 1991; Delli Carpini and Keeter 1996; Mayer 1992), we would expect older people to be more ill informed about politics and public policy than they are and to have lower electoral participation rates than they do.

and the relative importance of chance in shaping reelection success.

The selection effects of elections could also be tested by relating the number of times an incumbent is reelected to some measure of competence or quality. For example, we might conjecture that presidents differ in their economic or foreign policy competence. My theory then implies that two-term presidents preside over higher economic growth rates and fewer foreign policy crises, of which a greater number are successfully resolved, compared to one-term presidents. Similarly, we might interpret the quality of a congressional incumbent as standing for skills in pushing legislation through Congress or in "bringing home the pork." My theory then implies that long-term incumbents support or propose more bills, of which a greater number pass, compared to incumbents who lose office soon after their first election. Districts represented by long-term incumbents should enjoy more federal largesse than districts represented by short-term incumbents. To avoid the confounding effects of learning, lame duck status, and seniority, it makes sense to compare the performance of incumbents who subsequently are reelected to the *same-term* performance of incumbents who are not.

Retrospective Voting

The retrospective voting rules in my model are "egocentric," not "sociotropic" (Kramer 1983); that is, voters base their choice on the individual-specific policy outcomes they experience and not on their information about the state of the aggregate economy. My model takes the extreme position that voters only observe individual-specific policy outcomes; they are uninformed about other voters' experiences, and they do not have access to summary statistics reflecting the wealth and well-being of the electorate at large. This extreme assumption is made for the sake of simplicity, not for the sake of empirical realism. If this assumption were relaxed, then the voters' retrospective voting rules would respond to a mix of individual-specific and aggregate concerns.

Empirical tests attempting to discriminate between the egocentric and sociotropic voting hypotheses are beset by the difficulty of measuring how well off an individual voter is along with measuring how she cast her vote. For this reason, much of the evidence relies on survey rather than voting data. For example, Kinder, Adams, and Gronke (1989) employ survey data collected in connection with the 1984 presidential election. They conclude that voters' perceptions of the aggregate economy weighed most heavily, but they also find that individual, group, and national economic well-being constituted related but distinct criteria by which voters assessed the president's performance in office.

A more direct, and persuasive, test of my theory would examine the implication that the vote of special interests responds more sensitively to a given amount of redistribution than does the vote of the electorate at large. The empirical literature on retrospective voting

provides a benchmark: An incumbent can expect to gain X votes with a $Y\%$ increase in constituency income and lose X votes with a $Z\%$ decrease in constituency income. My theory suggests that a $Y\%$ increase ($Z\%$ decrease) in farm income that is causally connected to a farm bill rather than general economic circumstances should increase (decrease) the number of votes in agricultural districts by *more* than X .

EXTENSIONS

Interest Group Organization

One function of political lobbies is to collect information about the activities of elected politicians in a centralized way and then disperse this information among their members. The members may also collect information in a decentralized way, in which case the organization serves to pool their information. Either way, organized interests end up with access to better, or less costly, observations of political performance than do unorganized voters.

Why are some interests better organized than others? My theory of endogenous information gathering can be reinterpreted to address this question. Instead of paying a cost to become better informed, individuals might pay a cost to become organized, with the consequence that they will get information about political and economic factors influencing their wealth and well-being. According to my theory, if the number of people on one side of an issue is smaller than the number on the other side, the smaller group will become better organized than the larger group.

In many settings, the explanatory power of my hypothesis is weak compared to that of an alternative hypothesis: selective incentives. To illustrate the explanatory power of the latter, consider the astonishing fact that approximately half of all Americans over age 50, or 33 million people, are members of AARP. There is a simple explanation: For a nominal fee of \$8 per year, members acquire access to valuable private discounts and services.

But selective incentives alone cannot explain why some interests get organized and others do not. To the extent that older people are winning the redistributive "game" with the assistance of AARP, we need to ask why there is no comparable organization for younger people. Presumably some political entrepreneur could found the American Association of Persons Age 30–45 with at Least Two Kids. For a charge of \$8 a year this entrepreneur could offer attractive discounts negotiated with hotel chains and rental car companies and an array of (money-making) services. Of course, the entrepreneur would pay himself a lucrative salary for his efforts. Persons aged 30–45 with at least two kids would be happy to join because of the selective incentives offered. Once the association has, say, ten million members, it would have the power to lobby Congress for tax exemptions and other handouts to people age 30–45 with at least two children—at the expense of everyone else who does not fit this description.

Of course, there is no end to this logic. Why not have an interest group representing people age 20–35 with at least one child? The problem I identify here is isomorphic to the problem of majority rule cycling. A legislature facing the task of distributing a pie by simple majority rule ends up cycling endlessly: Any proposed distribution that makes a majority better off relative to the previous proposal or the status quo can be beaten by another proposal that makes another majority coalition better off (Condorcet 1785). Theoretical solutions to the problem of majority rule cycling in legislatures build on one of two assumptions: Legislators respect legislative norms (for example, a universalistic norm of reciprocal deference, as in Weingast 1979) or legislative organization (for example, recognition and majority rules, as in Baron and Ferejohn 1991). But there are no analogies to legislative norms and legislative organization in collective action. Thus, selective incentives alone do not tell us why older people are organized, to their advantage, and younger people are not, to their disadvantage.

My informational theory could serve as the stepping-stone to a theory of interest group organization: the degree to which people with shared interests are also informationally homogeneous may be one factor determining whether they get organized and pool information.

Special Interest Gridlock as a Multidimensional Collective Dilemma

Lohmann (1996) extends the analysis to more than one policy dimension, constructing an example with three voters and three policy dimensions. Each voter is a well-informed special interest on one dimension, where she benefits from a policy bias in her favor. On the other two dimensions, the voter is part of the ill-informed general public that suffers under the policy bias.

Now suppose that on a given policy dimension the incumbent takes away one dollar from the general public, or 50 cents from each of the two members of the general public, and gives 90 cents to the special interest, with 10 cents representing the deadweight loss of redistribution. The deadweight loss is a decreasing function of the incumbent's competence. Each voter observes, *with error*, that she was taxed a total of one dollar on her two dimensions as a member of the general public, and she observes, again *with error*, that she received 90 cents on her dimension as a special interest. Because the voter is ill informed about her two general public dimensions, she places a high weight on the possibility that the observed loss is due to the error; because the voter is well informed about her special interest dimension, she places a high weight on the possibility that her gains are due to the incumbent's competence. Because the incumbent cannot observe the errors in the voters' signal extraction problems, from his perspective the probability that a given voter supports his candidacy depends probabilistically on the voter's losses and gains on all three dimensions. Because the voter responds less sensitively to a loss on the

two general public dimensions and more sensitively to a gain on the special interest dimension, the incumbent can generate a net increase in the probability that he is reelected by redistributing resources from the general public to the special interest—despite the deadweight loss of redistribution. This result holds even though, because of the deadweight loss, each voter would be better off if the incumbent refrained from redistributive activities *on all policy dimensions*.

In a stylized way, this example captures a collective dilemma within which modern democracies are trapped. Inefficient government policies favor special interests at the expense of the general public. While special interests form a minority on any one policy dimension, just about every citizen is a member—active or not—of at least one special interest group on some policy dimension. Each citizen prefers being favored by government policy even at the expense of inefficiencies imposed on the society at large. But relative to the status quo involving inefficiencies on all policy dimensions, each citizen would be better off if government did not cater to special interests at all. Voters clamor for government to streamline and reduce the scope of its redistributive activities. They are disgusted with special interest politics and with the limited choice of candidates, all of whom are viewed as beholden to special interests. But any serious attempt to implement the expressed wish of the general public requires cutting someone's "pet" program, and any politician who does so can count on being DOA at the polls with respect to the votes of that group.

Opaque Procedures and Inefficient Policy Instruments

Another extension of my theory allows the incumbent to choose between transparent and opaque procedures or efficient and inefficient policy instruments. By employing opaque procedures, he obfuscates the policy bias toward special interests. For example, "legislators hide their tracks by delegating authority to the executive, by combining all actions into a single omnibus bill, by meeting behind closed doors, or by acting without a recorded vote" (Arnold 1990, 119). In economic policy, opaque instruments are often inefficient. For example, opaque market interventions that increase the relative price of agricultural products so as to improve farm income are inferior to transparent direct income transfers; opaque voluntary export restraints are inferior to transparent tariffs. Reelection incentives thus explain why incumbent policymakers deliberately employ inefficient policy instruments (Arnold 1990; Coate and Morris 1995).

The analysis of Arnold and Coate and Morris complements my analysis. I examine voters' incentives to gather costly information to *reduce* the variance confounding their inferences about the incumbent's type. In my interpretation, Arnold and Coate and Morris examine the incumbent's incentives to *increase* that same variance so as to confound the voters' inferences.

Valence versus Position Issues

My analysis assumes that candidate quality is a "valence issue," that is, candidates are linked with some condition that is valued positively or negatively by the entire electorate (Stokes 1963). In contrast, "position issues" involve government actions over which voters have conflicting preferences. One extension of my theory allows candidates to be purely policy motivated and to differ in their policy preferences. Each voter is incompletely informed about the candidates' policy ideal points. She only observes the policy outcome. Based on this observation, each voter forms an estimate of the distance between the incumbent's policy ideal point and her own. She compares this distance to the expected distance between the challenger's ideal point and her own and then votes for the candidate whose ideal point is expected to be closer. The incumbent thus faces a tradeoff. On the one hand, he can set policy so as to persuade a majority of voters that his interests coincide with theirs, thereby increasing his chances of survival. Because he is policy motivated, the incumbent derives utility from being reelected because he prefers himself to set policy rather than have policy be set by a candidate with different policy preferences. On the other hand, the more the incumbent accommodates any given voter, the larger is the distance between the policy and the incumbent's ideal point, and the lower is the incumbent's first-period utility. The incumbent trades off the second-period selection effects and the first-period policy effects on his utility level. Alesina and Cukierman (1990) develop a model along these lines, albeit without allowing for informational heterogeneity among different groups of voters.

Coups, Riots, Rebellions, and Revolutions

My analysis is institution-free with one exception: I assume that a majority of the electorate can vote the incumbent government out of office in regular free elections. With some modifications, my theory also applies when the opposition seizes power by extralegal means. The logic of retrospective voting that holds in democracies (good economic performance improves the reelection prospects of incumbents) holds more generally for other forms of political participation and for nondemocracies: Good economic performance is negatively correlated with coups, riots, rebellions, and revolutions (cf. Londregan and Poole 1996). My analysis adds informational heterogeneity to the standard logic: Incumbents maintain low food prices; to the advantage of urban interests and at the expense of rural interests, to reduce the probability of urban unrest that would threaten their stay in power (Bates 1981).

Common Agency

The analysis also extends the literature on common agency in political settings (Epstein and O'Halloran 1997) by allowing for differentially well-informed political principals. I develop a principal-agent model

with one agent (the incumbent) and multiple principals (the voters). The voters cannot write incentive contracts for the incumbent. Instead, they can vote him out of office if they are dissatisfied with his performance. The incumbent has one task: to supply a differentiated-benefits collective good. Voters differ in the degree to which they can monitor the incumbent's performance, which contains information about his quality. As a consequence, the incumbent has an incentive to bias policy in favor of voters who have better monitors of his performance. The logic of this argument carries over, with appropriate modifications, to other common-agency relationships in political settings—a legislator balancing the interests of voters and organized interest groups; a party leader trading off electoral pressures against the ideological demands of intraparty factions; a regulatory agency responding to pressures from Congress, the executive, and the courts.

PROSPECTS FOR POLITICAL REFORM

My informational hypothesis explains why political competition does not allow voters and political candidates to break free of special interest gridlock. At first glance, a political entrepreneur who campaigns on eliminating all the perks enjoyed by special interests will be elected by a majority. But people cannot effectively monitor whether the candidate keeps his promise. Once elected, the incumbent seeking reelection shares the incentives of his predecessors to cater to special interests.

The policy bias could be reduced if well-informed interest groups or political candidates dispersed information to the general public, but political competition is unlikely to eliminate all information disparities across voters. The interests of information providers do not usually coincide with those of the general public, and free-rider concerns may undermine their costly efforts to educate the public. But even if voters were smothered with "costless" information, it is doubtful that they would pay attention and process detailed information about the complexities of public policy they do not care much about. In contrast, special interests are "naturally" better informed; compared to the general public, they get costless information as a by-product of their specialized activities, and they have stronger incentives to invest in costly information gathering, to pay costly attention to complex information, and to invest in costly expertise that allows them to understand such information.

The question, then, is whether reform efforts are better aimed at modifying the policymaker's response. One necessary condition for the redistributive bias favoring special interests is that the incumbent cares about his reelection prospects. That motive could be removed in one of two ways: lifetime tenancy or term limits. Both solutions are imperfect, for two reasons. First, there is no guarantee that an incumbent who either holds office for life or is subject to a tenure restriction has incentives to maximize aggregate welfare as opposed to favoring special interests. The track record of dictators has not been very promising and

incumbents facing electoral termination may well accommodate special interests who control their future career paths. Second, weakening the electoral connection implies forgoing the selection gains generated by retrospective voting: An incompetent incumbent may remain in office for life, and a competent incumbent may be forced out of office after one term.

To remove electoral influences on public policy, elected politicians may choose to set policy by formula or delegate authority to independent agencies. But rigid formulas require ongoing discretionary adjustments to new and unforeseen circumstances, which opens the door to pork-barrel politics. Similarly, a formally independent agency cannot be perfectly isolated from electoral politics. Threatened with the possibility of "runaway" bureaucracies, or agency drift, politicians are reluctant to give up all political control. They set up *ex ante* and *ex post* controls that provide an opening for electoral pressures (McCubbins, Noll, and Weingast 1987). For example, interest groups and citizens disaffected by agency decisions may file complaints with their elected representatives and trigger oversight activities (McCubbins and Schwartz 1984). Here, information asymmetries between political principals and their agents create biases and inefficiencies that must be traded off against the benefits of delegation (Hopenhayn and Lohmann 1996; Lohmann and Hopenhayn 1998).

Proposals for reform are often directed at real or perceived deficiencies of the political process and political institutions. If corrupt campaign finance practices are the root of special interest handouts, then campaign finance reform is the answer. If a dysfunctional Congress is taken to be the driving force for inefficient pork-barrel projects, then the line-item veto giving the president the right to strike such projects out of the government budget offers itself as a solution. While I do not dispute that reform efforts of this kind can have a positive effect at the margin, I contend that the fundamental cause of the policy bias lies elsewhere, namely, with the information asymmetry between the general public and special interests.

Effective political reform would close this information gap by affecting people's incentives to monitor the activities of elected politicians. In a large electorate beset by the free-rider problem, however, the incentives to gather costly information are driven by the competitive race for partisan influence and not by the consensus goal of identifying and reelecting "good" politicians. From a welfare perspective, it may well make sense to accept the existence of a policy bias favoring special interests as the price of a selection process that weeds out bad political candidates and favors the good.

Domestic Opposition and Signaling in International Crises

KENNETH A. SCHULTZ *Princeton University*

This article explores the effect of domestic political competition on the escalation of international crises. It combines an incomplete information model of crisis bargaining with a simple model of two-party electoral choice. One state has two strategic actors—a government and an opposition party—both of which declare openly whether they support the use of force to alter the status quo. The rival state updates its beliefs and selects its strategy in response to both signals. The parties' payoffs depend upon a retrospective evaluation by the domestic electorate. The model shows that the inclusion of a strategic opposition party decreases the ex ante probability of war by helping to reveal information about the state's preferences. This finding has important implications for research on democracy and international conflict, since it suggests a mechanism through which democratic states can overcome informational asymmetries, which have been identified as a central obstacle to negotiation.

The claim that democracies rarely, if ever, fight wars against one another has generated a great deal of research on how democratic institutions and practices affect the outcomes of international crises. Work generally falls into two categories, one emphasizing the role of democratic norms favoring nonviolent conflict resolution (e.g., Dixon 1994; Doyle 1986; Maoz and Russett 1993; Russett 1993) and the other focusing on the constraining effect of institutions that promote accountability and competition (e.g., Bueno de Mesquita and Lalman 1992; Lake 1992; Morgan and Campbell 1991; Rummel 1979). Though they rely on different causal arguments, both schools maintain that democratic leaders prefer to settle disputes through negotiation and compromise rather than through force.¹

Despite its emphasis on negotiation, however, much of this research has developed in isolation from the large and growing body of literature on international crisis bargaining (e.g., Bueno de Mesquita, Morrow, and Zorick 1997; Fearon 1992, 1994, 1995; Kilgour and Zagare 1991; Morrow 1989; Powell 1990). This shortcoming is particularly troubling because work in this area has generated two insights that are problematic for the democratic peace literature. First, the costs associated with war mean that all states—regardless of regime type—have incentives to reach efficient bargains that avoid violence. Thus, democratic states are not distinctive in their preference for negotiated outcomes. Second, the mutual desire for a negotiated settlement does not ensure that an efficient bargain will always be reached. If information about the states' expected value for war is distributed asymmetrically, then bargaining can fail. Hence, peaceful relations depend not only on a mutual preference for peace but also on the ability of states to overcome informational asymmetries that can cause war in spite of such preferences.

The primary danger associated with asymmetric information is that actors uncertain about their rivals' preferences will mistakenly take actions that bring about an unwanted war. Under conditions of incomplete information, a state may be unsure whether a challenge will lead to war or to a profitable revision of the status quo, whether rejecting an offer will bring about conflict or a more favorable offer. In such cases, states face a gamble that sometimes favors actions entailing a risk of war. Though war is suboptimal ex post, actions that lead to war can be optimal ex ante.

This situation is compounded by the fact that states engaged in international disputes generally have incentives to misrepresent their willingness to fight through bluff and bluster (Fearon 1992, 1995; Morrow 1986). Absent such incentives, a condition of asymmetric information would be trivial to overcome through simple communication. Yet, the conflict of interests inherent in a crisis situation makes communication difficult. Since each state expects its rival to engage in strategic misrepresentation, distinguishing genuine threats from bluffs is problematic. Under these circumstances, sending credible signals of resolve often requires states to take actions that entail a risk of war (Fearon 1992, 1994; Powell 1990; Schelling 1960). Such actions can separate states that have high value for war from those with low value for war, since the latter should be less willing to approach the "brink." Unfortunately, while risky actions can serve to reveal information, they also may have the effect of making war more likely. The act of signaling can thus lead to the very outcome that the signals were intended to prevent.

This logic suggests that further work must be done on whether and how domestic political institutions can help overcome the problems associated with asymmetric information. This article addresses that question by focusing on one institutional feature generally associated with democracy: regular and public competition between political parties. It combines a standard crisis bargaining game with a simple model of two-party electoral choice. In doing so, it moves away from the unitary state assumption that underlies most deterrence models by breaking down one of the rival states into two strategic actors: a governing party and an opposition party. These parties vie for the support of

the electorate through their public actions in the international crisis—in particular, the government's decision whether to threaten force and the opposition's decision to support or oppose such a threat. Because these actions are observable, they reveal to the rival state information about the government's underlying political incentives and, hence, its willingness to wage war.

The model shows that the probability of war is lower when informative signals can be sent by both parties than when the government is the lone voice of the state, as it is in politics in which competition is poorly developed or actively suppressed. Introduction of an opposition party creates two reinforcing effects. First, the opposition party can lend additional credibility to a government's threats by publicly supporting those threats in a crisis. The decision to support the government reveals that there are political incentives to carry through on a threat to wage war. Hence, the opposition can bolster the government's signal with a "confirmatory signal" of its own. Second, the existence of an opposition party forces the government to be more selective about the threats it makes. When there is weak political support for war, the opposition can reveal this fact by deciding to oppose the government's threat. Because the rival state is more likely to stand firm in the face of an opposed threat, outright bluffing is inherently riskier. As a result, a government with a domestic competitor has less opportunity to misrepresent its preferences, and the dangers associated with asymmetric information are consequently lower.

The model developed here builds on two works dealing with the informational properties of political institutions. Bueno de Mesquita and Lalman (1992, chapter 5) argue that democratic institutions help signal a state's preferences by revealing that the government faces above-average costs for using force. In this view, democracy facilitates the mobilization of opposition, meaning that democratic leaders face generally higher costs in the event that they fight a losing or costly war. The state's preferences are thus revealed not by a conscious act of the government but by the very nature of the institutions, which cannot be concealed.

This argument represents a useful first step, but it stops short of actually modeling domestic politics.² Opposition parties are not strategic actors but a passive source of costs. This assumption obscures the fact that opposition politicians can and do make choices about whether to support the government in a threat or use of force. U.S. experience, for example, offers the contrast between the Spanish-American War, in which the

opposition party helped push the government toward an intransigent stance, and the crisis leading up to the Gulf War, in which many Democratic representatives publicly opposed the use of force (e.g., Offner 1992; Zaller 1994). Similarly, British history provides a contrast between the Fashoda crisis, in which opposition parties supported the government and helped convince France of the latter's resolve, and the Suez crisis, in which Labour opposition emboldened Egypt to resist British threats (e.g., Epstein 1964, 74–87; Wright 1951). The model presented here thus improves on that of Bueno de Mesquita and Lalman (1992) by letting the opposition party choose a policy position in response to its political incentives.

The second work on which this model builds is by Fearon (1994), who argues that states can send credible signals of their resolve if they face a powerful domestic audience that can punish them for bluffing. In this framework, political leaders expose themselves to "domestic audience costs" when they make public threats in a crisis, and they incur these costs if they back down. The costliness, and hence credibility, of threats depends on the magnitude of the punishment that can be imposed by the domestic audience. If electoral institutions provide an effective mechanism for sanctioning state leaders, then democratic leaders should be able to generate higher audience costs and thus send more credible signals of their resolve.

The model developed here goes farther by introducing a more complete framework of political competition. It shows that a domestic competitor can decrease the dangers inherent in costly signaling. In Fearon's model, exposure to sufficiently high audience costs can "lock" the government into a war that it would rather not fight. Indeed, it is the government's willingness to court this danger that makes its threats credible. An opposition party which can independently confirm the government's resolve makes it possible to reveal information in a less risky manner. Moreover, the introduction of a second signaler can lead to informative behavior even if the government's threats generate no audience costs.

The article proceeds as follows. The first section discusses the main assumptions about political competition that underlie the model. The second section lays out the game, which is then solved in section three. The fourth section discusses the model's implications for the democratic peace and the larger research program on democratic distinctiveness. Some conclusions follow.

BASIC ASSUMPTIONS ABOUT ACTORS AND INSTITUTIONS

Since the purpose of the model is to capture the effects of democratic competition on international bargaining, we first need to consider the basic form this competition takes. The theory developed here rests on three broad assumptions about the actors and the nature of the political institutions.

² Furthermore, the underlying argument that democracy makes war more costly for political leaders can be questioned. As Gowa (1995) points out, nondemocratic leaders also face the prospect of removal; even if the probability of their removal is relatively lower, the associated costs can be much higher, that is, death or exile rather than early retirement (see also Goemans 1995). Moreover, democratic leaders may face larger political gains from winning wars, so even if the costs of losing are greater, their expected value for war need not be systematically lower. This implies that war may be riskier for democratic leaders—in the sense that the variance in potential payoffs is higher—but not necessarily costlier *ex ante*.

Political Parties Seek Office

The first assumption is that political parties value holding office and therefore choose strategies designed to maximize their probability of election. This assumption means that parties are concerned with how voters evaluate their performance in international crises, since this evaluation affects their chances of holding office in the future. In basing the parties' payoffs on the electorate's response, it is not necessary to assume that foreign policy performance is the sole, or even most important, determinant of electoral outcomes. Such an assumption would fly in the face of considerable evidence to the contrary. Instead, it is only necessary to assume that parties' handling of international disputes is one factor that influences electoral fortunes. Unless voters ignore these events entirely, office-seeking behavior should carry over into the realm of crisis decision making.

On this point, there is both systematic and anecdotal evidence suggesting that political outcomes are influenced by international crisis outcomes and that politicians care about how voters assess their handling of these situations. Bueno de Mesquita, Siverson, and Woller (1991) and Bueno de Mesquita and Siverson (1995) show that losing a war or winning a costly war decreases the likelihood that a government will retain office. Cotton (1986) confirms this finding in the case of the United States. With respect to opposition parties, Regens, Gaddie, and Lockerbie (1995) show that members of Congress who voted against U.S. entry into the Mexican-American War and World War I were less likely to be reelected than those who voted in favor of those wars.³ This finding suggests there are political costs to opposing a war that voters consider successful.

There is less systematic evidence regarding the electoral effect of nonwar crisis outcomes. Nevertheless, several studies of the United States show that voters' evaluations of foreign policy performance influence their overall assessment of candidates (Aldrich, Sullivan, and Borgida 1989; Hurwitz and Peffley 1987; Nincic and Hinckley 1991). Moreover, crisis situations with the potential for use of force have a greater effect on voter perceptions than do other areas of foreign policy, which are generally less visible and salient (Almond 1950, 70–1).

Finally, anecdotal evidence suggests that politicians take into account the expected reaction of voters when deciding to support or oppose the use of force. Zaller (1994), for example, provides an illuminating account of how U.S. politicians weighed the political ramifications of their actions before the Gulf War. This was true not only of President Bush but also of congressional Democrats, who agonized over whether to vote

in favor of military action. The perception that this decision would have electoral implications was nicely expressed by one congressional aide, who called the vote "a potential career-killer" (Zaller 1994, 262). Even though we now know that the 1992 elections were more heavily influenced by other factors, politicians concerned about reelection clearly could not and did not ignore the potential voter reaction to their performance.

The assumption that parties seek office generates a conflict of interest between the government and the opposition. If we envision competition as an interaction between two parties or two cohesive coalitions, then whatever increases the probability of election for one will decrease the probability for the other.⁴ Hence, government and opposition are locked in a zero-sum game for political office.⁵

This conflict between the parties plays a crucial role in ensuring that their signals are informative. The underlying intuition is straightforward: Two information sources are better than one, especially when they have competing interests (Krehbiel 1991, 84; Milgrom and Roberts 1986). Competition between two signalers constrains the ability of both to misrepresent what they know and increases the credibility of certain signals. While one actor may have incentives to engage in misrepresentation, it is unlikely that two actors with competing interests will collude in such an act. Thus, a given signal will have greater credibility if it is sent by multiple actors with competing interests than if it is sent by one actor with known incentives to lie—a phenomenon known as confirmatory signaling. Moreover, if there are penalties for lying or bluffing, the existence of another actor with incentives to expose a bluff can increase the risks of opportunism.

Opposition Parties Have Access to Relevant Information

The second assumption is that opposition parties have access to information relevant to the crisis—in particular, information about the political ramifications of war. In general, an actor's expected value for war is a function of the probability of different war outcomes

⁴ Introducing multiple parties would be a natural extension of this model. In principle, the conflict of interest is less stark in such a setting, since two parties could attempt to collude to the detriment of a third. This modification would only affect the logic presented here if there were opportunities for collusion between a party in the governing coalition and a party in opposition. Collusion within government or opposition coalitions is essentially assumed already by treating them as unitary actors.

⁵ It should be recognized that, by basing the payoffs entirely on the probability of election, the model may overstate the conflict of interest between opposing parties. From the perspective of its electoral chances, the opposition would like nothing better than for the government to engage in a disastrous and costly war. There is a point at which unfavorable international outcomes may be undesirable even to the opposition, however. For example, a war that results in destruction of the state or its annexation by foreign powers would deprive opposition politicians of their chance to hold office—and possibly of their lives. At that extreme, then, the relationship between the international outcome and the opposition's payoff gets more complicated.

³ In the case of the Gulf War, Regens, Gaddie, and Lockerbie (1995) find no evidence that Democrats who opposed the use of force against Iraq paid at the polls. They attribute this finding to the length of time between the war and the 1992 election and the influence of intervening factors, such as the economy. Nevertheless, it is clear that Democrats suffered a prolonged period of low poll ratings as a result of their opposition to the war. Moreover, Senator Sam Nunn has said that his vote against the use of force scuttled whatever chances he had for the presidential nomination (see Pace 1996).

and the relative values of winning and losing. Assume that states fight a winner-take-all war over some good, whose value we normalize to one, and that all sides incur costs of fighting a war. If state i 's probability of victory is p_i , and its expected costs of war are c_i , then its expected value for war is given by

$$w_i = p_i - c_i. \quad (1)$$

Notice that, in this formulation, the c_i term captures the costs of war *relative to* the value of the disputed good.

Though any or all factors in this expression may be sources of uncertainty, the model assumes that actors hold private information about the costliness of war relative to the value of the disputed good—a factor often termed “resolve.”⁶ Whereas p_i depends heavily on the balance of military capabilities, resolve rests in large part on the configuration of domestic political interests. How much is the good in question worth? What costs are we willing to pay? What risks are we willing to take? From the perspective of foreign states, the answers to such questions are harder to observe than, say, the number of tanks and airplanes each side possesses.

These are also questions for which the opposition party is likely to share the government's informational advantage over the rival state. Opposition parties have relevant information due to previous experience in office and access to legislative institutions. Moreover, parties out of power are still in a position to make inferences about the configuration of domestic interests. Political parties exist to aggregate information about political preferences, to anticipate the likely electoral consequences of their actions, and to choose their public strategies appropriately.⁷ If they do not, then they will not last long. We thus assume that opposition parties take advantage of their resources to gauge the expected political ramifications of war, and especially how the likely costs compare with the stakes.

Competition Is Public and Unrestricted

It is crucial for this analysis that parties compete in public. Open political debate means that foreign states can “overhear” the policy statements used to build electoral support. These statements reveal information about the parties' underlying political incentives. For this communication to be meaningful, of course, there must be no legal sanctions against public dissent during international crises. Opposition parties must be able to

choose their strategies based on political considerations, rather than on any normative or legal constraints. After all, support for a government's policies conveys no meaning if that support is coerced. Competition should be based on the concept of “loyal opposition,” meaning that dissent over government policies does not imply disloyalty to the state.

Together, these assumptions imply a polity that has many attributes of democracy, but they do not require strict adherence to some ideal definition of democracy. Though competition is a *sine qua non* of democratic government, many nondemocratic polities also experience forms of competition. What is crucial for this analysis is that competition takes place in public, so that the positions of contending parties are observable to foreign states; that it is unfettered by restrictions on dissent; and that parties out of power are not so excluded from the political process that they have no access to relevant information. In terms of Dahl's (1971) classic definition of polyarchy, this model places primary importance on “public contestation” but imposes no requirements on the level of participation or inclusiveness.

A BARGAINING MODEL WITH A STRATEGIC OPPOSITION

The model considered here describes an international interaction between two states, one of which permits public competition of the kind posited above. This competitive polity is composed of two strategic actors—a governing party and an opposition party—and a nonstrategic actor—the domestic electorate. The parties take actions that both the electorate and the rival state can observe. These strategies, and the corresponding response of the rival state, determine the outcome of the international game. Since the parties are assumed to be office-seeking, their payoffs depend upon how the voters evaluate their performance in the crisis. This evaluation is based on the public positions taken by the parties in the crisis and the realized outcome.⁸ This section provides a formal description of the game and the voters' evaluation of the parties.

The International Crisis

The crisis game presented here is based on deterrence and crisis bargaining models (e.g., Bueno de Mesquita, Morrow, and Zorick 1997; Fearon 1992, 1994; Kilgour and Zagare 1991; Morrow 1989; Powell 1990). Two states compete over the possession of some good. The exact nature of the good is not important and can be thought of as anything states may value: territory, a source of wealth, a policy, an institution, and so on. A crisis occurs when one state challenges the other for possession of the good. Each then has an opportunity

⁶ Fearon (1992) interprets the c_i term in equation 1 as the state's resolve.

⁷ Indeed, this feature is what makes the action of political parties particularly informative. Domestic political preferences in a democracy can be expressed in any number of ways by many actors. Opposition can take the form of newspaper editorials, protests, demonstrations, strikes, and so forth. From the perspective of foreign states, the plethora of political activities observable in a democracy may seem confusing, but the existence of parties whose job it is to aggregate all this information provides foreign decision makers with a way to differentiate politically relevant signals from noise. The former should be reflected in the strategies of office-seeking parties; the latter should not.

⁸ In its basic structure, the model presented here is similar to that of Gaubatz (1998). In his model, government and opposition parties choose foreign policy positions in response to both international conditions and electoral incentives. In Gaubatz's model, however, there is complete information about the preferences of the domestic actors, so their policy positions do not serve as signals.

to stand firm or back down, thus conceding the good to the other side. When both states choose to stand firm, the result is war.

The main innovation here is that one state is decomposed into two strategic actors: the government and the opposition. Though the state itself is not an actor, it will be convenient at times to refer to this two-actor entity as S_1 . The government is assumed to have full control over the foreign policy decisions of S_1 . Thus, the decision to make a challenge and the decision to go to war are both made by the party in power. The opposition party cannot veto the choices of the government, but it can make a public declaration of its policy position—in particular, whether it supports the use or threat of force in order to change the status quo.⁹ The rival state chooses its strategy after viewing the actions of the government and the policy statement of the opposition.

Sequence of Moves. The game begins with the government's decision either to maintain the status quo (SQ) or to issue a public challenge (CH). We assume that any challenge includes an explicit threat to use force in the event that the demands are not met. Following the government's move, the opposition party chooses its policy stance. It selects either to support (SUP) or oppose (OPP) the use of force. Notice that SUP and OPP represent the opposition's stance regarding the use or threat of force to alter the status quo, not its position relative to the government's policy. Thus, if

the government chooses SQ, an opposition strategy of SUP does not imply support for the government but for the use of force.

If the government chooses to accept the status quo, then the game ends after the opposition's move. In the event of a challenge, and after the opposition makes its policy declaration, the rival state, S_2 , decides either to concede the good (CD) or to refuse the challenge (RF). If the former, then the game ends peacefully, with S_1 getting the entire good. If the latter, then the government faces a choice between backing down (BD) and standing firm (SF). The former implies that S_2 gets the good and the game ends peacefully, while the latter leads to war. Figure 1 presents the extensive form of this game.

Payoffs. There are four possible outcomes at the international level: status quo, S_2 concedes, S_1 backs down, and war. Without loss of generality, assume that the value of the good is one and that S_2 possesses the good in the status quo; concession by S_2 implies that the entire good is transferred to S_1 . In the event of a war, let p_i and c_i represent state i 's probability of victory and expected costs, respectively.¹⁰ Given these assumptions, the international outcomes can take on a value of zero (if the state ends up without the good), one (if the state gets or retains the good), or w_i , as defined in equation 1 (in the event of war). Since the government and opposition are assumed to be office-seeking, they do not value the international outcomes directly; instead, their payoffs are determined by the

⁹ In a presidential system with divided government, the opposition party may have some veto power over the government's decisions. Since this situation is not the norm among democratic states, I choose not to examine it here.

¹⁰ Obviously, since there are only two players and no draws, $p_1 = 1 - p_2$. Nevertheless, it will simplify the notation if these two terms are kept distinct.

electorate's evaluation of their performance, which will be described below. S_2 is treated as a unitary state, so its payoffs depend solely on the international outcome. Thus, S_2 gets a payoff of one if the government chooses SQ or backs down from its challenge, zero if S_2 concedes in response to a challenge, and $w_2 = p_2 - c_2$ if the game ends in war.

Information Structure and Beliefs. The game involves two-sided incomplete information: Each state is uncertain about the other's expected costs from war. To generate this condition, assume that nature randomly selects c_1 and c_2 from independent distributions over the ranges $[0, C_1]$ and $[0, C_2]$, respectively. Both the government and the opposition in S_1 observe the selection of c_1 , and S_2 observes the selection of c_2 . The distributions from which these terms are drawn are common knowledge. As it will simplify notation to express things in terms of w_i , these assumptions imply that the w_i are distributed over the range $[p_i - C_i, p_i]$. Let F_1 and F_2 represent the cumulative distribution functions of w_1 and w_2 , respectively.

Notice that, with these assumptions, it is possible for both w_i to be greater than zero simultaneously. When this is the case, there exists no peaceful solution that both sides prefer to war, since the state which backs down gets no more than zero. This possibility arises because the good is treated as indivisible: One side gets all; the other, none. In bargaining models with a continuously divisible good, both states can always be satisfied by some peaceful division even if their payoffs from war are both greater than zero (Fearon 1995). Nevertheless, treating the good as indivisible makes the game more tractable and does not affect the main results, with one exception. In the equilibria discussed below, the probability that $w_2 > 0$ is assumed to be relatively low. If this probability exceeds a certain threshold, then S_2 is highly likely to refuse a challenge regardless of what the government and opposition do. As a result, the government only makes challenges that it is serious about carrying out, and the opposition's strategy adds no additional information. Since this result is largely an artifact of the indivisibility of the good, its treatment is left to the Appendix.

The Electorate's Evaluation

Since the parties in this model are assumed to be office-seeking, their payoffs from the crisis game depend upon the ex post response of the electorate in S_1 . A complete model of how voters use public statements and observable outcomes to weigh the relative merits of opposing candidates is beyond the scope of this work. Instead, we rely on a simple set of assumptions that seem reasonable given the empirical patterns described above. The first is that voters prefer governments which deliver favorable outcomes to those which deliver unfavorable outcomes. Hence, the government's payoff should improve as the outcome it achieves in the international crisis improves. With respect to the opposition, it makes sense to assume that voters reward opposition parties which either support

successful policies or oppose unsuccessful policies, and they punish parties which oppose successful policies.

The result is a simple retrospective voting framework, which can generate payoffs in a straightforward manner.¹¹ Assume a homogeneous electorate whose utility from the international game increases with the amount of the disputed good received by S_1 and whose expected payoff from war is given by w_1 . The assumption of a homogeneous electorate implies that the disputed good is a public good with equal value to all voters and that the costs of war are distributed evenly. Obviously, this need not always be the case, and a possible extension of this work would be to explore the implications of a heterogeneous electorate. Since the electorate is not a strategic actor, it is not necessary to assume that it knows S_1 's expected value for war. For reasons that will be clear shortly, however, we assume the electorate has unbiased expectations: Its beliefs about war are systematically neither too high nor too low. Formally, if we let w_v denote the voters' expectations about war, we require that $E(w_v) = w_1$.

Now consider the four possible outcomes of the international game. When the government makes a challenge and the rival state backs down, the government receives a favorable evaluation from the voters for having acquired the good without a fight. If V_{gov} denotes how favorably the voters respond to the government, then we assume that $V_{gov} = 1$ in this case. The corresponding evaluation of the opposition, V_{opp} , depends upon that party's announced position. If the opposition supported the successful threat, then it can plausibly claim that it, too, would have generated the same outcome and should share some of the credit. Since the opposition did not actually manage the crisis, however, and we know that the government gets most of the credit or blame for foreign policy outcomes, it is sensible to assume that voters discount the credit they give to the opposition for supporting a successful outcome. Following Fiorina (1981, 73), we let the parameter r denote how much the voters discount the policy statements of the opposition due to the fact that it was out of power, with $0 \leq r \leq 1$. Thus, if the government gets a credit of 1 when the rival state concedes, then an opposition party that supported the government gets a credit of r .

If the opposition party opposed the government's successful threat, then it should incur political costs. A natural way to generate such costs is to assume that voters make the following inference from the opposition's stand: If the opposition was against the use of force, then its announced strategy would have generated the status quo as the outcome. Since voters get a payoff of zero from the status quo, they assign a credit of zero to the opposition in this case. The result is as desired: V_{opp} is higher when the opposition supports a successful policy (r) than when it opposes that policy (0).

Similar logic generates voter responses in the event of a war. The electorate's ultimate evaluation of the

¹¹ Hurwitz and Peffley (1987, 238–9) argue that retrospective voting models seem particularly appropriate in the area of foreign policy.

government depends on the outcome of the war. While the government does not know ahead of time precisely what this outcome will be, in expectation, $V_{gov} = w_1$. If the opposition supports the threat that led to war, then it shares some credit or blame for the outcome; the expected evaluation of the electorate is thus w_1 discounted by r , or $V_{opp} = rw_1$. If the opposition opposed the threat, then the voters again assume that the opposition would have delivered the status quo, or $V_{opp} = 0$. These assumptions imply that, when the war outcome is favorable (i.e., $w_1 > 0$), the opposition is better off having supported it than having opposed it.

In the event that the government backs down after making the challenge, the coding has some ambiguity. Following Fearon (1992, 1994), we assume that the government incurs audience costs for failing to carry through on a threat. The evaluation of the government thus reflects the electorate's unfavorable response to this outcome; in this case, we let $V_{gov} = -a$, with $a \geq 0$.¹² As before, it makes sense for voters to ascribe the status quo payoff to the opposition party in the event that it opposed the threat, or $V_{opp} = 0$. What is unclear is how the voters should react when the opposition supports a threat that the government fails to carry out. One possibility is that the voters punish the opposition just as they punish the government; in this case, V_{opp} would equal $-ra$. An alternative is to assume that the voters ascribe to the opposition their expected value for war, w_1 , which, in expectation (and minus discounting), equals rw_1 . This assumption implies that, if voters are sufficiently optimistic about their chances in war, the opposition derives some benefit from having supported the use of force when the government backs down.¹³ As it turns out, the solution does not depend at all on which assumption we make. To keep the payoffs parallel, then, we will let $V_{opp} = -ra$ when the opposition supports a threat from which the government backs down.

The final possible outcome is the status quo. As before, the voters' evaluation of the government is tied

to the value of the actual outcome, meaning $V_{gov} = 0$. In the event that the opposition opposes the use of force, we assume that V_{opp} likewise equals zero. There is some ambiguity as to how the voters should respond in the event that the opposition calls for the use of force after the government has selected the status quo. We observe empirically that opposition politicians may criticize governments which fail to take forceful action in a crisis. Bill Clinton's criticism of President Bush during the 1992 campaign over nonintervention in Bosnia is an obvious recent example (Gow 1997, 207–8). Given that the government has decided not to use force and the opposition has no control over foreign policy, such statements are rather cheap to make. Consequently, it is not clear why the voters should attribute much meaning to them. If the voters simply read such criticism as cheap talk, then the opposition should be indifferent between its strategy choices at this node, and any observed mix of opposition or support is understandable but ultimately has no effect on the game. An alternative possibility is that when the opposition supports force, the voters ascribe to it their expected payoff from war (minus discounting), which in expectation equals rw_1 . This means that, if the electorate believes it can do well in war (i.e., $w_1 > 0$), the opposition can score political points by criticizing the government's inaction. As it turns out, we will not observe this outcome in equilibrium since, whenever w_1 is sufficiently high that choosing the status quo would generate opposition criticism, the government would want to make the challenge anyway. This issue is addressed at greater length below.

We thus have a plausible set of assumptions for how the voters evaluate the two parties based on their performance in the crisis game. Since the parties are assumed to be office-seeking, their primary concern is how these evaluations will ultimately affect their probability of election at some future date. That electoral choice depends, in turn, not on the absolute evaluations, V_{gov} and V_{opp} , but on the relative assessment, or what Downs (1957, 40) refers to as the "party differential." Thus, to complete the payoffs, we assume that the government seeks to maximize $U_{gov} = V_{gov} - V_{opp}$, while the opposition seeks to maximize $U_{opp} = V_{opp} - V_{gov}$. Table 1 summarizes these payoffs as a function of the different possible outcomes. The payoffs corresponding to each terminal node are also shown in Figure 1.

¹² We assume that the audience costs are small relative to the maximum possible costs from war, so that $p_1 - C_1 < -a \leq 0$.

¹³ In the Fashoda crisis, for example, the opposition Liberal Party came out strongly in support of the Conservative government's intransigent stance against France. Liberal leader Lord Rosebery made it clear that he would try to capitalize politically should the government soften its stance: "No Government that attempted to recede from or palter with [the current] policy would last a week" (Wright 1951, 41).

Clearly, the voters in this model are not fully rational; at best, they are boundedly so. Fully rational voters use retrospective evaluations as guide to future payoffs, and so they only pay attention to past outcomes if these reflect on the parties' expected future performance. For example, in Smith's (1996) work on the diversionary use of force, voters attempt to discern the government's foreign policy "competence" from past international outcomes in order to gauge the government's likely performance in the next term. In the model presented here, the electorate's war payoff, w_1 , is not a function of the governing party's characteristics but of the state's capabilities and the costs and benefits of war to the voters. Consequently, it is not fully rational to evaluate the parties based on the outcome of the crisis game, since the government and opposition would have acted the same way if their roles were reversed. Technically, nothing can be learned of the parties' relative "fitness" for office.

Nevertheless, the simple framework employed here represents a useful simplification and is consistent with other recent models that involve retrospective voting on international crisis outcomes (i.e., Bueno de Mesquita and Siverson 1995; Fearon 1994; Gaubatz 1998). Introducing a fully rational electorate would require a fourth strategic actor and would greatly complicate the information structure of the game. The simple voting scheme employed here is a compromise for the sake of tractability. Moreover, the payoff orderings generated fit the empirical findings cited above. Thus, the payoffs describe a plausible rule-of-thumb decision criterion that meshes with the empirical regularities we have.

SOLUTION TO THE BARGAINING MODEL

This section presents the solution and main results of the bargaining model. Since the goal of this article is to explore how the introduction of a strategic opposition affects the dynamics of crisis bargaining, the central focus is on comparing the equilibria of the game proposed above with those of a game without an opposition party. We can thereby see how behavior and outcomes change when S_1 shifts from a polity in which competition is suppressed to one in which opposition parties openly compete for political support. In practice, capturing the former does not require solving an entirely new model. Setting the parameter r equal to zero while keeping all other assumptions as given generates a game in which the opposition party effectively does not exist.¹⁴ Thus, the core result that

interests us is the effect on the game when r shifts from zero to some number greater than zero. The formal solution to the model is presented in the Appendix. Here we present the main results.

Characterization of Equilibrium Strategies

The equilibrium strategies of the government and the opposition are described by a set of cutpoints along the continuum of possible types. The government's strategy is defined by two such cutpoints, which partition the possible types into three ranges. Let k_{gov} and b denote values in the range $[p_1 - C_1, p_1]$, with $k_{gov} \geq b$. A government of type w_1 uses the following decision rule.

(1) If w_1 exceeds k_{gov} , then the government makes the challenge and stands firm at the final node. Since types in this range will carry through on the threat to use force, their challenges can be said to be genuine. It is shown in the Appendix that this cutpoint always equals $-a$, meaning that the government makes genuine challenges whenever the payoff from war is preferable to incurring the audience costs.

(2) If w_1 falls between k_{gov} and b , the government makes the challenge but backs down in the face of a refusal. Since these types will not enforce the threat, their challenges are bluffs.

(3) If w_1 is lower than b , the government selects the status quo. Though types in this range never have to make a choice between standing firm and backing down, their off-the-equilibrium-path strategy is to back down.

When the game includes an opposition party, there is an additional cutpoint describing its strategy. Let k_{opp} denote a value in the range $[p_1 - C_1, p_1]$, such that an opposition of type w_1 uses the following decision rule in response to a government challenge:

(1) If w_1 exceeds k_{opp} , the opposition supports a threat to use force, and

(2) if w_1 is less than k_{opp} , the opposition opposes a threat to use force.

It is shown in the Appendix that $k_{opp} \geq k_{gov}$, implying that the opposition supports only genuine challenges but not all such challenges. When the government chooses the status quo, the opposition supports force if and only if $w_1 \geq 0$. Since the government always makes a challenge in these cases, however, we never see Gov SQ/Opp SUP in equilibrium.

As can be seen in Figure 2, these cutpoints divide the continuum of possible types into three or four regions, depending on whether the game includes an opposition party. When there is none (2a), the government's two cutpoints partition the continuum into three ranges: Types which make genuine challenges, types which bluff, and types which select the status quo. The inclusion of an opposition party (2b) introduces an additional cutpoint, which partitions genuine challenges into those supported by the opposition and those opposed. For reasons that will be clear shortly, we can refer to the former as "confirmed" challenges.

The intuition behind these strategies is straightforward.

¹⁴ Alternatively, we could assume that an opposition party or faction exists but that it cannot publicly dissent from the government. In this interpretation, the opposition can oppose or support the challenge, but it does so privately, so that the rival state cannot observe its position. Formally, this can be captured by assuming that S_2 's two decision nodes comprise a single information set, meaning that S_2 does not know which strategy the opposition selected. This interpretation would generate the same predictions as assuming $r = 0$, so the discussion will concentrate on the latter interpretation, since it is simply a special case of the general solution. Moreover, while there is some appeal to assuming that nondemocratic states experience private competition, it is not clear that the voting rule, derived from observations of democratic electorates, is appropriate in this context.

FIGURE 2. The Effect of the Opposition Party on Strategies and Outcomes

ward. As S_1 's expected value for war increases, the government's expected payoff from making a challenge also increases. Thus, higher types are more likely to threaten force than lower types. Notice, though, that the government may sometimes bluff in equilibrium. This is a natural result of asymmetric information: There are often incentives for actors to misrepresent their types in hopes of getting a higher payoff. Only when the government's expected payoff from war is very low does it choose to forswear a challenge altogether.

Once the government has made a challenge, the choice of the opposition boils down to a decision either to "match" the government by supporting the threat—thereby sharing credit or blame for the eventual outcome—or to oppose the threat and advocate the status quo. Clearly, as the expected payoff from war goes down, the attractiveness of the former decreases; the opposition prefers to distance itself from a threat that could result in either an unpromising war or a humiliating retreat. As the payoff from war increases, the opposition would rather support the threat and get some credit for the (expected) favorable outcome.

The fact that the opposition's cutpoint, k_{opp} , is higher than the government's cutpoint, k_{gov} , implies that the opposition will sometimes oppose a threat to use force even though the government is willing to make and carry out such a threat. This does not reflect greater dovishness on the part of the opposition but a reluctance to match the government unless the credit from doing so is sufficiently high. We will see shortly

that, by supporting the challenge, the opposition can increase the probability that S_2 will concede. As long as $r < 1$, however, the government gets most of the credit for such a success. Thus, the opposition has some incentive to pursue an "irresponsible" strategy: Oppose the threat and gamble that the international outcome will be unfavorable (Gaubatz 1998). This incentive goes away when the state's expected payoff from war is relatively high; in this case, all possible outcomes from the government's challenge are sufficiently attractive to the electorate that the opposition prefers to hop on board.

S_2 's equilibrium strategy is a function of its beliefs, which in turn depend upon the signals sent by the government and opposition. Since S_2 only gets to move if the government makes a challenge, two possible signals are of interest: Gov CH/Opp SUP and Gov CH/Opp OPP.¹⁵ From S_2 's perspective, the important question upon viewing these signals is: What is the probability that the government will stand firm in response to a refusal? In other words, what is the probability that the challenge was made by a government of type $w_1 \geq k_{gov}$?

As noted above, the opposition only supports genuine challenges. Thus, the support of the opposition unambiguously signals that the government will fight in the event of a refusal. Given this, S_2 knows that it faces a choice between conceding the good or waging war;

¹⁵ It is trivial to show that S_2 plays RF off the equilibrium path if the government plays SQ.

there is no chance that the government will back down. Since conceding leads to a payoff of zero, S_2 refuses only if the costs of fighting are so low that its expected payoff from war, w_2 , is greater than zero. Let s denote the probability that this condition holds.

If the opposition opposes the challenge, then S_2 is left uncertain about whether the threat is genuine or a bluff. Recall from Figure 2b that both kinds of threats may be opposed by the opposition. If $k_{opp} > w_1 \geq k_{gov}$, then an opposed threat is still genuine: Governments in this range will stand firm in response to a refusal. Governments for which $k_{gov} > w_1 \geq b$ also make opposed threats, however, and these are bluffs. As a result, S_2 faces some ambiguity regarding the government's true type. The rival state can always concede the good and ensure a payoff of zero. Refusing the challenge is a gamble: There is some chance that the government is bluffing and will back down, but there is also some chance that the threat is genuine and a refusal will lead to war. Because war is only a possibility and not a certainty, even an S_2 that prefers concession to war—that is, for which $w_2 < 0$ —may find it optimal to take the gamble and refuse the challenge. The uncertainty generated by the opposition party's strategy thus means that more types of S_2 are willing to refuse the challenge than are willing to do so when the opposition supports the government. The probability with which S_2 refuses when the opposition opposes the threat is consequently greater than the probability with which S_2 refuses when the opposition supports the threat. If we let s^* denote the former, then this intuition implies that $s^* > s$.

The Effect of the Opposition Party

We can now address the central question of this article: How do behavior and outcomes change as a result of the public competition in S_1 ? What happens to the equilibria when we go from a game without an opposition party to one in which an opposition makes informed public statements? As noted above, we can answer this question by determining how strategies and outcomes change when we move from $r = 0$ to the general case in which r is some value greater than zero. Theoretically, of course, the model can make precise predictions across the entire range of r . Yet, because of how r is defined (the degree to which voters discount policy statements from the party out of power), it is unclear how small variations in this parameter map into real-world variation among political systems. The empirically relevant question is the difference between polities that do and do not suppress competition, a difference which can be captured by comparing the $r = 0$ case with the $r > 0$ case.¹⁶

The shift from a game without an opposition to one

with an opposition entails two important changes. First, the opposition party can increase the credibility of some challenges by publicly supporting the use of force. When S_1 's expected value for war is sufficiently high (i.e., $w_1 > k_{opp}$), a strategic opposition has political incentives to back the government's threat to use force. In doing so, the opposition essentially confirms that the government is serious about carrying through on the challenge. The effect of this signal derives from the fact that the opposition is engaged in a competition with the government and supports it only if the expected value for war is sufficiently high. *Thus, while the government may have incentives to bluff, the opposition has no incentive to collude in a bluff.* The rival state interprets a supported threat as a credible threat and will consequently back down, unless it has positive expected utility from war.

Because of this effect, the existence of an opposition party permits information to be revealed more reliably than when the government is the lone voice of the state. Interestingly, the opposition can play this role even when the government's challenge generates no audience costs. When $a = 0$, the government can costlessly make challenges regardless of its type, since the worst possible outcome, backing down and getting zero, is the same as choosing the status quo. Because of this, the government's strategy conveys no information. Yet, the Appendix contains a proof showing that the opposition party still sends informative signals in this case, as its decision to support or oppose still partially separates genuine threats from bluffs. This suggests that the existence of a second information source can compensate for the government's inability to send costly signals.

The second change when a strategic opposition is introduced is a decrease in the government's willingness to bluff. Notice from Figure 2 that cutpoint b shifts to the right when the opposition party is added to the interaction, meaning that the range of types which bluff in equilibrium shrinks. The intuition underlying this result is straightforward. Just as the opposition's support increases the credibility of a threat, the opposition's dissent casts doubt on whether the challenge is genuine. If the government were to leave its strategy unchanged, then the rival state would want to refuse opposed challenges more often. In equilibrium, however, the government compensates by bluffing at a lower rate; formally, b increases. As a result, domestic opposition does not increase the probability of a refusal relative to the case in which no opposition party exists. Instead, the adjustment is made by the government, which becomes more selective about making threats and less inclined to bluff.

What does all this imply for the probability of war? There are three ways to think about this question: the probability of war for different types of S_1 ; the probability of war ex ante, before the game even starts; and the probability of war given that a challenge has been issued. War occurs in the model whenever the government makes a genuine challenge—that is, a threat it is willing to carry out—and the rival state refuses. Hence, there is only a nonzero probability of war when $w_1 >$

¹⁶ Technically, the changes discussed below do not automatically operate once r moves from zero to any positive number. There may be small but positive values of r for which the game is identical to the $r = 0$ case. In particular, the introduction of the opposition has no effect on the game until r is sufficiently high that $k_{opp} < p_1$. The exact threshold at which this happens can be determined using the specification of k_{opp} given in the Appendix.

k_{gov} , because any threats made by types falling below this cutpoint would not be carried out. Given that a genuine challenge has been made, the probability of war is the same as the probability that S_2 refuses. Using the notation introduced above, this probability is s when the opposition supports the threat and s^* when the opposition opposes the threat or when there is no opposition party. Because the opposition's support confirms the credibility of the threat, s is less than s^* . Thus, for types in the range $[k_{opp}, p_1]$, the probability of war is lower in the game with a publicly active opposition than in the game without such an opposition.

This result implies that the introduction of an opposition party decreases the ex ante probability of war, that is, the probability of war prior to nature's selection of w_1 and w_2 . Because the danger of war is reduced in the highest range of w_1 , the expected probability of war across the entire range also falls. This result is driven by the fact that the probability of a refusal by the rival state is the same (s^*) when an opposition party opposes the government's threat and when there is no opposition party. Thus, while types in the range $[k_{opp}, p_1]$ see their probability of war decline with the introduction of competition, those in the range $[k_{gov}, k_{opp}]$ have the same probability of war in both versions of the game.¹⁷

How does public competition affect the conditional probability of war given that a challenge has been made? On this point, the results are ambiguous because of two countervailing effects. Once a challenge is issued, a peaceful outcome can come about in one of two ways: Either S_2 concedes the good, or the government backs down from the challenge. On the one hand, adding an opposition party to the game increases the probability of the former, on average, since the rival state is less likely to refuse challenges publicly supported by the opposition. On the other hand, introducing competition also makes the government less likely to bluff. Given that a threat has been made, the probability that the government will back down in response to a refusal is lower in the game with an opposition than in the game without an opposition. Thus, governments that face domestic competition are less likely to have their challenges refused but more likely to stand firm in the event of a refusal; governments unconstrained by public competition are more likely to have their challenges refused, but they are also more likely to have been bluffing in the first place. Which effect dominates is unclear and depends upon the actual distribution of types.

All these comparative statics make use of the finding that the probability of S_2 refusing a challenge is the same when an opposition party publicly opposes the

government's threat and when there is no opposition party. One potential modification to the game would alter this result. As noted earlier, the outcome in which the government selects the status quo and the opposition scores political points by advocating the use of force never happens in equilibrium. The reason is that the electorate's views about war are always correct in expectation. Hence, whenever w_1 is such that the opposition could profitably support the use of force, the government will always make the challenge. Likewise, whenever the government chooses the status quo, the voters' expectations about war are sufficiently pessimistic that they would punish, not reward, the opposition should it advocate force. If we were to assume, however, that the opposition could systematically gain by supporting force after the government has selected the status quo, then the effect on the game would be to increase the probability that S_2 resists after seeing an opposed challenge. The reason is that, if the status quo becomes less desirable to the government because of the opposition's criticism, then equilibrium can only be restored if the rival state refuses challenges at a higher rate, thus making challenges less desirable as well. In this case, the probability of war in the range $[k_{gov}, k_{opp}]$ would be higher when the game includes an opposition party than when it does not. The overall effect on the ex ante probability of war would be ambiguous, since the introduction of the opposition would lower the probability of war in one range and raise it in another.

This caveat is worth noting, but it begs the question of why the electorate would systematically reward the opposition in such a situation. This is not to deny that we do observe cases in which the opposition scores politically by criticizing a government's inaction. Yet, my sense is that this phenomenon would be better captured by moving to a model with heterogeneous voters—in which the government and opposition could play to different segments of the electorate—than by making ad hoc amendments to the current model.

One final comment should be made. In principle, nothing in the underlying logic requires S_1 to be the first mover. We could imagine inserting an additional step at the beginning of the game and permitting S_2 to decide whether to make a challenge. This game is more complicated because it introduces a third signaler. S_2 has no reason to misrepresent its type in the current version of the game, but it would now have a more complex set of incentives. There is no reason to think that the basic insights would be fundamentally affected.

It is worth recalling a caveat mentioned earlier, however: The equilibrium changes if the ex ante probability that S_2 is committed to refusing at its final node is quite high. Thus, if S_2 were to move first and face very large audience costs for conceding, this alternative equilibrium could operate. In this case, there is a good chance that S_2 has to refuse regardless of what the government and opposition do. As a result, the government has no incentive to bluff, and since all the government's threats are genuine, the opposition's decision to support or oppose conveys no additional information. This suggests that there are some condi-

¹⁷ The relationship between the audience cost term, a , and the probability of war is less straightforward because of two countervailing effects. Since all types for which $w_1 > -a$ can and do make genuine threats, an increase in a increases the range of types willing to make the threat and go to war if refused. An increase in a , however, decreases the probability that S_2 will refuse, since the chance that a given challenge is genuine increases with a . The net effect on the ex ante probability of war is unclear.

tions under which the introduction of an opposition in S_1 has no effect on behavior and outcomes in the modified game. As I will suggest below, this claim might generate an additional empirical implication.

IMPLICATIONS

The model suggests that open domestic political competition can decrease the danger of war due to asymmetric information. An unfettered opposition party can enhance the government's ability to make credible threats in a crisis by creating a second information source that effectively confirms the government's resolve. At the same time, the opposition party can undermine the credibility of some challenges by publicly opposing them. Since this strategy threatens to increase the probability of resistance from the rival state, it forces the government to be more selective about making threats. A government has less leeway to engage in strategic misrepresentation when it faces a domestic competitor with political incentives to reveal its low expected value from war. Together, these effects ensure that more information is revealed when a state permits open competition than when it does not.

This argument has important implications for the research program on democracy and international conflict. The model developed here demonstrates a mechanism through which institutions associated with democracy can help states overcome the difficulties inherent in bargaining. Accordingly, we should expect democratic states to have enhanced ability to reach peaceful outcomes relative to states in which competition is restricted or takes place out of public view. Unlike other arguments about democracy, this finding does not require any assumptions about the relative pacifism of democracies. The democratic state in this model is not motivated by norms of nonviolent conflict resolution, nor does it necessarily have "dovish" preferences due to the existence of domestic competition, as Bueno de Mesquita and Lalman (1992) assume. Instead, the model permits a wide range of possible preferences over war and peace. The prediction of fewer wars derives solely from the democratic state's superior ability to signal its true preferences, *whatever those may be*. As a result, this argument is consistent with Layne's (1994) observation that democracies have, in a number of cases, behaved quite belligerently, even toward one another. Indeed, this model shows that one way democratic states can bring about peace is by convincingly demonstrating unanimous support for war.¹⁸

Because the rival state is treated as a unitary actor, the model stops short of capturing the interaction between two democratic states. As a result, its relevance to the democratic peace—which is primarily a claim about democratic dyads—is more suggestive than

conclusive. We can surmise that, if both polities were to permit competition of the kind posited here, then the probability of war would be lower than in an interaction involving one democracy or none. Given that this situation is not explicitly modeled, and given the caveat that the effect of domestic competition may be attenuated when the state is the target of a challenge rather than the initiator, the main value of the model does not lie in rederiving the democratic peace.

Instead, the model's central contribution is in suggesting general processes and patterns associated with democracy. The core logic of the argument—that public contestation facilitates the revelation of information in crises—does not depend on the constitution of the rival state. Thus, these institutions should have effects that are not confined to democratic dyads. A common claim in the democratic peace literature is that there are no such monadic effects and, in particular, that democratic states are just as war prone as nondemocratic states (e.g., Maoz and Abdulali 1989). Recent results in this area have been mixed, however, and several studies suggest that democracy has a generally pacifying influence independent of the regime type of rival states (e.g., Benoit 1996; Gleditsch and Hegre 1997; Ray 1995; Rummel 1995). This model is consistent in spirit with these results. It may also explain why studies of crisis escalation have produced weak and inconsistent results when looking for the effect of democracy on the probability that a crisis will escalate once it begins.¹⁹ As we saw, the relationship between S_1 's regime type and the conditional probability of war given a challenge is ambiguous.

In addition, two specific hypotheses emerge from the discussion in the previous section. Two effects are associated with the introduction of an opposition party: A confirmatory effect results from the opposition's ability to strengthen the government's signal, and a restraining effect results from the government's decreased willingness to bluff. The first suggests that, relative to nondemocratic states, regimes that permit public contestation are better able to convince rivals of their seriousness about using force. As a result, the probability that the rival state refuses a challenge must decline.²⁰ Thus, an implication of the model is that, *ceteris paribus*, threats made by democracies are less likely to be resisted than those made by states which do not permit competition.

The restraining effect implies that the probability of S_1 making a challenge in the first place decreases with the introduction of an opposition party. Recall that all

¹⁸ This counterintuitive result nicely complements the finding by Bueno de Mesquita and Lalman (1992, 158–60) that states with dovish preferences may, under certain circumstances, be more likely to get involved in wars. Both findings reinforce the need to think about the role of information in mediating between preferences and outcomes.

¹⁹ For example, Morgan and Campbell (1991) and Rousseau et al. (1996) show no or weak monadic effects of democracy on crisis escalation. Inconsistencies also appear in studies that focus on democratic dyads. For example, Rousseau et al. (1996) and Dixon (1994) find that joint democracy lowers the probability that a crisis will escalate to force, whereas Senese (1997) finds that democratic dyads are just as likely, and perhaps even more likely, to escalate to the use of force once involved in a crisis.

²⁰ In the game without opposition, the probability that S_2 will refuse, conditional on having been challenged, is s^* . In the game with an opposition, the probability of a refusal is the average of s and s^* , weighted by the conditional probability that the opposition supports the challenge. Since $s < s^*$, this weighted average is less than s^* .

types for which $w_1 > b$ make the challenge in equilibrium. Since the shift from suppressed to open competition implies that b increases, the likelihood that w_1 will fall in the relevant range decreases. The government's decreased willingness to bluff means that, all other things being equal, the probability of a challenge from a democratic state is lower than the probability of a challenge from a nondemocratic state. Because both of these effects derive from an argument about democratic states, not democratic dyads, both should be evident at the unit level and not be dependent on dyadic or "joint" democracy. Elsewhere (Schultz 1996, 1998), I provide preliminary evidence in support of these hypotheses.²¹

There may also be empirical leverage in the claim that domestic competition affects the game under a more limited set of conditions when the democratic state is the target rather than the initiator. This implies that, while democracies should be more selective about initiating crises, they may not be significantly more selective when choosing to resist a challenge.

Finally, the model suggests some patterns which should be observed within historical cases. Democratic governments should be sensitive to how domestic competitors may affect their ability to make credible threats in a crisis. They should be particularly careful about making threats that have tenuous political support, since the opposition party can readily undermine those threats. At the same time, foreign states should take into account the signals that emerge from the competitive process and make appropriate inferences. The finding that domestic opposition casts doubt on the credibility of the government's threats squares with a conventional wisdom that democracies are hard to read when they send multiple, contradictory signals. It is precisely under these conditions that the rival state faces the greatest uncertainty and the danger of war is highest. Yet, the model also suggests that mixed signals are only one possible outcome. When the domestic actors can agree, the result is less uncertainty than if there were only one information source. In this sense, the model tells us when we should expect democracies to speak clearly (when the payoff from war is either very high or very low) and when we should expect them to send mixed signals (when the payoff from war is in some middle range).

CONCLUSION

This article fits in the tradition of what Putnam (1988) refers to as "two-level games"—broadly speaking, games in which domestic and international interactions are mutually dependent. It is part of a growing set of formal models with an international actor and multiple domestic actors, all of whose strategies and beliefs are in equilibrium simultaneously (e.g., Milner 1997; Mo

1995; Pahre and Papayoanu 1997; Siverson 1998). Such models are particularly useful in moving beyond the unitary state assumption of traditional realism without undue loss of parsimony. Moreover, they offer a way to formalize general propositions about the effect of domestic institutional arrangements on international outcomes.

As noted at the outset, much of the literature on democracy and war has developed in isolation from the literature on crisis bargaining. Indeed, with few exceptions (Bueno de Mesquita and Lalman 1992; Fearon 1994), research in this area has failed to embed explanations of the democratic peace within a deductive framework that explains the outbreak of war. This article addresses this shortcoming by combining a model of democratic politics with a standard model of international bargaining that can account for conflictual outcomes. The resulting game shows how the introduction of public competition and a credible opposition party can enhance a state's ability to resolve disputes peacefully.

APPENDIX: FORMAL SOLUTION TO THE BARGAINING GAME

PROPOSITION 1. *The following strategies and beliefs constitute a perfect Bayesian equilibrium to this game.*

(P1.1) *The government plays*

CH, SF	if $w_1 \geq k_{gov}$, where $k_{gov} = -a$,
CH, BD	if $k_{gov} > w_1 \geq b$, and
SQ, BD	otherwise.

(P1.2) *If the government makes a challenge, the opposition plays*

SUP	if $w_1 \geq k_{opp}$, and
OPP	otherwise,

where $k_{opp} \geq -a$. If the government plays SQ, then the opposition plays SUP when $w_1 \geq 0$.

(P1.3) Let q denote S_2 's posterior probability that $w_1 \geq -a$ after observing the strategies of the government and opposition. Then,

$$q = \begin{cases} 1 & \text{if } S_2 \text{ observes CH and SUP,} \\ \frac{F_1(k_{opp}) - F_1(-a)}{F_1(k_{opp}) - F_1(b)} = q^* & \text{if } S_2 \text{ observes CH and OPP, and} \\ 0 & \text{if } S_2 \text{ observes SQ.} \end{cases}$$

(P1.4) S_2 plays

RF	if $w_2 \geq -\frac{1-q}{q}$, and
CD	otherwise.

Proof. Most of the elements of this equilibrium are straightforward to derive. The opposition's strategy after the government plays SQ and the government's strategy at its final decision nodes follow readily from the payoffs. The latter turns out not to depend on the opposition's strategy, since in both cases SF is preferred to BD whenever $w_1 \geq -a$. S_2 's posterior beliefs, given in P1.3, are derived logically from the strategies and Bayes's rule. Given these beliefs, S_2 's expected payoff from RF is a weighted average of its payoff from war and its payoff from getting the good, or

$$EU_2(RF) = qw_2 + (1 - q). \quad (2)$$

²¹ It is interesting to note that Fearon (1994, 585) generates similar predictions based on the assumption that democratic governments can generate higher audience costs—an assumption that is not required here. Though the causal stories leading to these predictions are different, their similarity reflects common reliance on the logic of signaling.

Comparing this value to S_2 's certain payoff from CD, zero, yields the decision rule in P1.4.

What remains is to show that the strategies given in P1.1 and P1.2 are sequentially rational and to derive expressions for k_{opp} and b . To do so, we need to derive the two parties' expectations about S_2 's behavior. If the opposition supports the threat, S_2 knows that the government will stand firm in the face of a refusal, or $q = 1$. Given this, S_2 plays RF only if $w_2 > 0$ —that is, if it prefers war to conceding the good. The probability of this is

$$s \equiv \text{Prob}(w_2 > 0) = 1 - F_2(0). \quad (3)$$

If the opposition opposes the threat, then S_2 updates as shown in P1.3 and plays RF if the condition given in P1.4 holds. The probability with which this condition holds is

$$s^* \equiv \text{Prob}\left(w_2 > -\frac{1-q^*}{q^*}\right) = 1 - F_2\left[\frac{F_1(b) - F_1(-a)}{F_1(k_{opp}) - F_1(-a)}\right]. \quad (4)$$

Since $b < -a$, the term in brackets is less than zero. It follows that s^* , the probability with which S_2 will refuse when the opposition opposes the threat, is always greater than s , the probability with which S_2 will refuse when the opposition supports the threat.

For the government's decision rule to hold, it must be the case that a government of type $-a$ is indifferent between CH and SQ. Since it was proposed that an opposition of type $-a$ will play OPP, the expected value of a challenge for a government of this type is

$$EU_{gov}(CH) = s^*(-a) + (1-s^*). \quad (5)$$

The value for choosing SQ is zero. Setting equation 5 equal to zero, we find that

$$s^* = \frac{1}{1+a} \quad (6)$$

must hold for the government's cutpoint to be rational.

Note that S_2 's strategy leaves all governments of type $w_1 \leq -a$ indifferent between CH and SQ. Because of this, the cutpoint b separating types that make the challenge from types that choose the status quo can be drawn anywhere in the range $[p_1 - C_1, -a]$. In equilibrium, b must be such that equations 4 and 6 hold simultaneously. Setting these expressions equal to each other, we find that

$$F_1(b) = [F_1(k_{opp}) - F_1(-a)]F_2^{-1}\left(\frac{a}{1+a}\right) + F_1(-a). \quad (7)$$

This expression need not be simplified further for now, since it is sufficient to conduct the comparative statics of interest to this article. It is necessary to point out, however, that for the cutpoint at b to be lower than the cutpoint at $-a$, it must be the case that

$$F_2(0) > \frac{a}{1+a}.$$

This implies that the probability with which S_2 has negative expected utility from war must be sufficiently high relative to the audience cost term, a . Proposition 2 (below) considers the equilibrium that results when this condition does not hold.

The opposition's cutpoint must be such that the opposition is indifferent between OPP and SUP when $w_1 = k_{opp}$. For an opposition of this type, expected payoff from supporting the government is

$$EU_{opp}(\text{SUP}) = s(r-1)k_{opp} + (1-s)(r-1). \quad (8)$$

The expected payoff from opposing the government is

$$EU_{opp}(\text{OPP}) = s^*(-k_{opp}) + (1-s^*)(-1). \quad (9)$$

Setting these expressions equal to each other, we find that

$$k_{opp} = 1 - \frac{r}{s^* - s(1-r)}. \quad (10)$$

To check that k_{opp} is indeed bounded at the lower extreme by $-a$, we find that k_{opp} is decreasing in r , meaning that it is minimized when $r = 1$. Substituting $r = 1$ into equation 10 yields

$$k_{opp} = 1 - \frac{1}{s^*} = -a.$$

Both k_{opp} and b can be reduced to functions of the parameters, but the algebra is needlessly messy. The expressions in equations 7 and 10 are sufficient for the comparative statics. In particular, we note that b is a decreasing function of k_{opp} and, hence, an increasing function of r . *Q.E.D.*

PROPOSITION 2. *If $F_2(0) < a/(1+a)$, then the equilibrium derived in proposition 1 has the following characteristics.*

(P2.1) $k_{gov} = b = -F_2(0)/(1 - F_2(0)) > -a$.

(P2.2) $k_{opp} = k_{gov}$.

(P2.3) Keeping the definition of q from above, then

$q = 1$ if S_2 observes CH (regardless of the opposition's strategy), and

$q = 0$ if S_2 observes SQ.

(P2.4) S_2 plays

RF if $w_2 \geq 0$, and
CD otherwise.

Proof. Assume that the government's cutpoint, k_{gov} , is as given in P2.1. Because $b = k_{gov} > -a$, a threat by the government is always genuine. Hence, regardless of the opposition's strategy, $q = 1$ following a challenge. As before, when $q = 1$, S_2 plays RF only if its expected utility from war is greater than zero. The probability with which S_2 will refuse is thus equal to s , as defined in equation 3.

The government's cutpoint must be such that a government of type $w_1 = k_{gov}$ is indifferent between CH and SQ. Since $k_{gov} > -a$, a government of this type will go to war in the event of a refusal by S_2 . Hence,

$$EU_{gov}(CH) = s(k_{gov}) + (1-s). \quad (11)$$

Setting equation 11 equal to zero, we find that the government is indifferent between SQ and CH if

$$k_{gov} = -\frac{F_2(0)}{1 - F_2(0)},$$

as proposed above. Moreover, $k_{gov} > -a$ whenever the condition stipulated in the proposition holds. Since all types for which $w_1 < k_{gov}$ strictly prefer the status quo, there is no bluffing in this equilibrium, or $b = k_{gov}$.

Finally, the opposition's cutpoint is derived as in equation 10. Since S_2 plays RF with the same probability regardless of the opposition's strategy, however, we derive k_{opp} by setting $s^* = s$. Doing so generates $k_{opp} = k_{gov}$. *Q.E.D.*

The final proposition demonstrates that this game can generate informative signaling in equilibrium even when the government's threat generates no audience costs, or $a = 0$. There are actually two such equilibria. The first is the same as that described in proposition 1, since there is nothing in the

above derivation which requires $a > 0$. In this case, both the strategies of the government and opposition are informative, since not all types of government make the challenge, and the opposition confirms some threats and not others. The second equilibrium takes a slightly different form, because, when there are no costs to backing down at the final node, all possible types of government may make the challenge in equilibrium. In this case, the government's signal is uninformative, but the opposition's signal still helps separate some genuine threats from bluffs.

PROPOSITION 3. *The following strategies and beliefs describe a perfect Bayesian equilibrium to this game when $a = 0$.*

(P3.1) *The government plays*

CH, SF if $w_1 \geq 0$,
CH, BD otherwise.

(P3.2) *The opposition plays*

SUP if $w_1 \geq k_{opp}$ and
OPP otherwise, where $k_{opp} \geq 0$.

(P3.3) *Let q equal S_2 's posterior probability that $w_1 \geq 0$ after observing the strategies of the government and opposition. Then,*

$$q = 1 \quad \text{if } S_2 \text{ observes CH and SUP, and} \\ q = \frac{F_1(k_{opp}) - F_1(0)}{F_1(k_{opp})} \equiv q^* \quad \text{if } S_2 \text{ observes CH and OPP.}$$

(P3.4) S_2 uses the decision rule shown in P1.4.

Proof. The beliefs given in P3.3 follow directly from the equilibrium strategies, and S_2 's decision rule is identical to that derived in proposition 1. The strategy of the government follows from the fact that $a = 0$. Because there are no costs to making a challenge and then backing down, only types for which $w_1 \geq 0$ will stand firm at the final node, but all types are willing to make the challenge, since the worst possible payoff from making a challenge (0) is the same as the payoff from playing SQ. Thus, the signaling strategy of the government is uninformative.

To show that there is informative signaling in this equilibrium, we need to show that the opposition's cutpoint, k_{opp} , is greater than or equal to zero, so that the opposition's strategy separates at least some of the types that make genuine threats from those that are bluffing. Determining k_{opp} requires that we first calculate s^* , the probability that S_2 will refuse after the opposition plays OPP. Using the definition of q^* from P3.3, s^* is derived as in equation 4:

$$s^* = 1 - F_2 \left[\frac{-F_1(0)}{F_1(k_{opp}) - F_1(0)} \right]. \quad (12)$$

The calculation of k_{opp} follows exactly as in equations 8–10 above. Substituting equation 12 into equation 10 generates an unwieldy and recursive expression for k_{opp} . Nevertheless, it can be shown that there exists an equilibrium solution in which k_{opp} is greater than or equal to zero. To see this, we note that, if k_{opp} is nonnegative, then it is decreasing in r . It is equal to one when $r = 0$ and hits its minimum when $r = 1$. Thus, if we can show that $k_{opp} \geq 0$ when $r = 1$, it follows that this is true for all values of r .

We conjecture that, when $r = 1$, $k_{opp} = 0$ in equilibrium. If this is true, then the opposition's strategy perfectly separates genuine threats from bluffs: All the former receive support, and all the latter are opposed. In this case, S_2 interprets OPP as a sure signal that $w_1 < 0$, or $q = 0$. As a result, all types of S_2 have an incentive to refuse an opposed

challenge, or $s^* = 1$. Substituting $r = 1$ and $s^* = 1$ into equation 10 confirms that $k_{opp} = 0$, as conjectured.

Since k_{opp} , at its minimum, equals zero, it follows that there is some nonnegative solution for k_{opp} for all values of r . Because of this, the opposition continues to send informative signals even when $a = 0$, since its strategy separates some genuine challenges from bluffs. *Q.E.D.*

Thoreau's Alternative Economics: Work, Liberty, and Democratic Cultivation

BRIAN WALKER *University of California, Los Angeles*

Henry Thoreau's *Walden* is frequently read as the tale of a disaffected Romantic individualist escaping the rigors of community and modern society to seek refuge in a pondside idyll. I argue that this is a fundamental misreading which misses the political import of the book. *Walden* reveals itself to be a democratic advice-book focusing on the tensions between the political ideal of free self-direction and the unfavorable work conditions that laborers often face. Thoreau's goal is to set out a strategy by which economically vulnerable citizens may enact their liberty and autonomy in threatening employment conditions. To that end, Thoreau reformats themes and practices from various ancient philosophical traditions. *Walden* is one of the few texts in our tradition in which strategies are thought through for the individual laborer attempting to maintain freedom while at the same time making a living. It therefore merits our closest attention.

The constant choices and self-direction entailed in meaningful work enliven all our capacities. On a stroll through New York's Upper East Side as people catch their morning taxi, it is hard not to be impressed by the sleekness and fervor you find there—the alert eyes, purposeful movements, and general liveliness of a caste of individuals with invigorating and demanding employment. One great advantage of the modern era is the array of stimulating occupations for those fortunate enough to have the tastes, capacities, and fortune of birth that allow them to find meaningful work. For so many others, work is of another sort: arduous labor, loud machinery, or confinement in some cubicle, unable to leave because an aging parent depends upon them for support. In its contrasting roles as our foundational source of empowerment and as one of our most invasive afflictions, work plays a dominant role in shaping the energies and capacities we bring to our families, our communities, and political action.

The role that work plays has become greater in recent decades. In the United States, the number of hours spent at work each year has increased significantly since the early 1970s. According to the U.S. Bureau of Labor Statistics (1997, 1), women worked an average of 20% more in 1996 than in 1973, adding a full 233 hours to their working year, while men added 100 hours to theirs. The proportion of people with very long workweeks has risen significantly in every occupation (Rones, Ilg, and Gardner 1997, 8–10). There have also been important changes in the quality of work. Corporate downsizing and a shift in organizational structure have made careers much less stable, and there has been a marked rise in contingent work and temporary employment (Belous 1989). In America, the

conditions that permitted a person to envision a stable career are vanishing for many people (Harrison 1994, 214–24). In a society that enshrines labor as a calling, these transformations in the shape and place of work are likely to have many far-reaching effects.

Political theorists have long given attention to the fundamental role that work plays in political life (Arendt 1958; Elster 1986; Lane 1991; Marx [1867] 1967; Murphy 1993). But very few voices in our tradition discuss employment from the point of view of the individual laborer attempting to maintain freedom and equilibrium in relation to the world of work. A major exception is Henry David Thoreau's ([1854] 1995) *Walden*. Some critics have dismissed it as the work of a petulant and disaffected Romantic individualist, but this is not an accurate reading of the text.¹ More careful attention reveals *Walden* to be a carefully constructed study of the tensions between liberty and employment in times of economic change.² *Walden* is one of the rare works of political theory that asks us to think critically about our relation to the work we do, and it gives advice as to strategies and practices we

¹ For example, compare Morton and Lucia White's (1962, 41) classic description of *Walden* as "a diatribe against the life of the village [by an] isolated individual . . . free of all social attachments" with Thoreau's chapter, "The Village," in which he emphasizes that "every day or two I strolled to the village to hear some of the gossip . . . which, taken in homeopathic doses, was really as refreshing in its way as the rustle of leaves and the peeping of frogs" (Thoreau [1854] 1995, 108–9, emphasis added) and with his comment that "I had more visitors while I lived in the woods than at any other period of my life" (p. 93). Thoreau constantly reminds us of his avid taste for society, "for I dearly love to talk" (p. 53). Or compare the Whites' (1962, 155) statement about a "Thoreauvian . . . antipathy to civilization as such" with Thoreau's ([1854] 1995, 19) comment: "It is asserted that civilization is a real advance in the condition of man—and I think that it is."

² The vision of *Walden* as a guidebook for malingerers and political free-riders ignores Thoreau's constant reference to the needs and predicaments of his fellow citizens, his compassion for their plight, and the frequency with which he explores themes central to the democratic theory of the Jacksonian era—liberty and dependency, serfdom and nobility. The apolitical reading of Thoreau also ignores his political activism and aid to fugitive slaves (Richardson 1986). On the various ways in which political theorists have misread Thoreau and missed the deeper political purposes of his works, see Taylor 1996.

might adopt if we want to elaborate more flexible responses to the shifting economy of work in which we find ourselves.

Thoreau's central theme is that working conditions in a market democracy can easily undermine liberty and erode autonomy. His goal in *Walden* is to set out strategies by which people might enact their freedom when they face working conditions that are likely to threaten their autonomy and well-being. After a careful reading of *Walden* we may still be uncomfortable with many of Thoreau's strategies—his idea of voluntary poverty will not appeal to everyone—but at least we will no longer underestimate *Walden*'s complexity and subtlety as a reflection about the preconditions for democratic enactment in market societies.

WALDEN AND EMPLOYMENT

We have had few political philosophers like Henry David Thoreau who have made their living as day laborers. Thoreau worked as a house painter, mason, land surveyor, gardener, and pencil maker so that he would have the free time to be a writer, naturalist, and abolitionist lecturer. His insights about the centrality of employment stem in part from the strenuous ideal of democracy that Thoreau absorbed while growing up in Jacksonian America and in part from his vulnerability as a day laborer within the swiftly restructuring economy of his time.³ *Walden* is filled with references to economic transformations that parallel those of our era in so many ways: a new interconnectedness brought about by the development of transportation infrastructure; diminished distances owing to the growth of railways, canals, and roadways; the rise of newspapers; the increasing power of large corporations; and the swift changes in working conditions brought about by the spread of factory labor (Lebeaux 1977; Neufeldt 1989; Sellers 1991).⁴ The commercial spirit had taken hold of Concord, as it had so much of the republic in the postwar period (Wood 1992, 325–47). Thoreau's mother took in boarders, his father ran a struggling pencil manufacturing business, and the family lived in "honest poverty" (Lebeaux 1977, 38). Thoreau attended Harvard as a scholarship student, but as Edward Emerson wrote (Lebeaux 1977, 43): "The comparatively small amount which it cost to maintain a boy at Harvard . . . was enough seriously to strain the resources of the family."

Given this background, it should not be surprising that Thoreau considered the question of employment to be crucially important; in his words, it was "the most practically important of all questions." In 1851 he wrote:

There is little or nothing to be remembered written on the subject of getting an honest living. Neither the New Testament nor Poor Richard speaks to our condition. I

cannot think of a single page which entertains, much less answers the questions which I put to myself on this subject. . . . Is it that men are too disgusted with their experience to speak of it? Or that commonly they do not question the common modes? The most practically important of all questions, it seems to me, is how I shall get my living, and yet I find nothing to my purpose in any book. . . . I consider that society with all its arts, has done nothing for us in this respect (Thoreau [1906] 1951, 164).

Walden was an attempt to fill this lacuna and to explore how citizens forced to fend for themselves in a market democracy might get their living without scotching their liberty.

A careful reading of *Walden* leaves little doubt that employment is the enframing theme of the book. In the opening section, "Economy," in which Thoreau gives reasons for reading his book, he repeatedly underlines the occupational problems facing his fellow residents in Concord. Images of particular forms of employment and their drawbacks crowd the first pages of *Walden* (pp. 1–52): in which Thoreau writes of his fellow citizens in their roles as farmers, teamsters, slave-drivers, surveyors, herdsmen, town officers, inspectors, sailors, factory operatives, merchants, masons, housewives, and carpenters. When Thoreau writes of visiting Concord he speaks primarily of workspaces—of "shops and offices, and fields" (p. 2)—and of the desperation he finds there. The word "labor" and its cognates is mentioned dozens of times in the opening section of *Walden*; seven times on the first three pages alone. When Thoreau wrote a précis of the book to deliver on the lyceum circuit, he first entitled the speech "Getting a Living." There can be little doubt as to what this book is about.

DEMOCRACY AND EMPLOYMENT

Thoreau argues that whatever one may think of the American political system (he writes of it as "comparatively free," p. 3), at the level of everyday work life it has produced only limited improvement over the feudalisms of Europe. Mortgaged to the banks, deeply in debt, threatened with financial failure, and toiling without cease, the men and women of Concord are, for all their seeming independence, still living as if they were "serfs of the soil" (pp. 1–3). "The mass of men lead lives of quiet desperation. What is called resignation is confirmed desperation" (p. 4). Compared to the rest of the world, certainly, America is free, but working conditions consistently reproduce some of the worst aspects of the old tyrannies. Despite the ostensible liberties of the American nation, Thoreau's audience still finds itself "lying, flattering, voting, contracting yourselves into an atmosphere of thin and vaporous generosity" (p. 4). *Walden* is about the ways in which the American project of democratization may be seen as blocked and disabled by everyday working conditions.

Thoreau makes four sorts of argument about the tensions among democracy, autonomy, and employment. First, to be free means to have time for one's proper pursuits; time to figure out what one wants to

³ On economic restructuring in Jacksonian America, see Sellers 1991.

⁴ For his views on changes in transportation in his time, see Thoreau ([1854] 1995, 34, 60, 75); on corporations, p. 17; on factory labor, pp. 16, 22.

do and then go out and do it. Yet, earning a living can easily fill up or overshadow the time for such pursuits.⁵ “The laboring man . . . has no time to be anything but a machine” (p. 3). Second, there is a tension between work and democratic capacities. Employment conditions frequently entail a “contraction and dilation” (p. 4) of the self, which undermines autonomy and upsets our ability to make the rational calculations necessary for the meaningful enactment of liberty (pp. 3, 22, 61). Third, there is also the problem of the narrowing of our choice-set. Seeking success in the terms of the current work environment means accepting what public opinion at any given moment values as the best life. But individuals may well have tastes that lead them to want a sort of life different from the narrow subset which their society values and promotes. “The life which men praise and regard as successful is but one kind. Why should we exaggerate any one kind at the expense of others” (p. 12)? Individuals who have tastes and/or capacities which lead them to develop their talents other than through the socially approved work-paths thus need strategies for protecting their own pursuits in the face of these socially sponsored exaggerations about what is admirable and what is not. Fourth, a concern with maintaining employment may prevent people from taking principled political positions and thus make them acquiesce in immoral policies. As Thoreau (1993, 4) suggests in “Civil Disobedience”:

Practically speaking, the opponents to a reform in Massachusetts are not a hundred thousand politicians at the South, but a hundred thousand merchants and farmers here who are more interested in commerce and agriculture than they are in humanity, and are not prepared to do justice to the slave and to Mexico, *cost what it may*.

Thoreau carefully draws our attention in *Walden* to the fact that he moved to his cabin “on Independence day, or the fourth of July, 1845” (p. 55), and the book is studded with references to the political nature of his explorations of independence and freedom. George Kateb (1992, 82) writes of Thoreau and his generation as the intellectual inheritors of the founding; they “disclose its fuller meaning.” Thoreau shares with other writers of his time the idea that the republicanism of the founding period has established only the institutional preconditions for democracy and liberty, and the real work of creating a democratic culture remains to be done.⁶ The founding opened up a new possibility, but the crucial challenge is to enact democracy, to flesh it out in concrete attitudes, practices, and institutions. People too easily mistake the legal preconditions of liberty for the real thing. Here is how

Thoreau ([1854] 1993, 22) puts the problem in “Slavery in Massachusetts”:

Now-a-days, men wear a fool’s cap, and call it a liberty cap. I do not know but there are some, who, if they were tied to a whipping-post, and could get but one hand free, would use it to ring the bells and fire the cannons, to celebrate *their* liberty. So some of my townsmen took the liberty to ring and fire; that was the extent of their freedom; and when the sound of the bells died away, their liberty died away also; when the powder was all expended, their liberty went off with the smoke.

Thoreau is not alone in his belief that we need to think through how we might establish real liberty in the United States. Much of the work of Emerson, Margaret Fuller, George Ripley, Elizabeth Cady Stanton, Walt Whitman, Bronson Alcott, and other antebellum reformers can be usefully read within this perspective of a hortatory literature of democratic enactment. There is a widespread recognition in this era that most of the values democrats take seriously—liberty for all, equality among people, personal autonomy—are very hard to realize in an everyday world long formatted by more hierarchical visions and in working conditions that produce both opportunities and severe challenges.⁷ Democratic capacities are fragile and evanescent. They tend to fade from sight amid the bright temptations of everyday life unless they are enacted in concrete practices, strategies, and dispositions. This belief in the evanescence of the central democratic capacities is clearly an echo of republicanism, with its vision of human liberty constantly threatened by the corruptions of power and money and by general inattentiveness.⁸ *Walden* is a particularly interesting work within this tradition because of the way it works out the theme of democratic enactment in relation to the economy of everyday life and the trade-offs of work and leisure.

DEMOCRACY AND SELF-CULTIVATION

Walden is also important because of its focus on individual laborers trying to navigate the dilemmas of their work life. The book reflects many of the conventions of a broader democratic-advice genre that rose to prominence in the antebellum period. In the United States in the 1830s and 1840s there was a widespread exploration of how citizens might prepare themselves for their new roles as democratic citizens, while as fathers and sons they attempted to orient themselves in a market economy, and as mothers they trained future citizens (Wood 1992, 357). Bookstores were filled with manuals of advice, young men’s guidebooks, periodicals for mechanics, and exemplary biographies of famous Americans, such as Ben Franklin and George Washington (Neufeldt 1989, 102–5). The Boston area, in particular, was a center for this movement of democratic self-cultivation, with its popular lyceum lectures, young men’s mercantile libraries, evening

⁵ For some, of course, work is their proper pursuit, and the dilemma does not arise. Thoreau explicitly exempts such fortunates from his discussion: “I do not speak to those who are well-employed” (p. 10).

⁶ Entirely typical of this tradition is a comment by Ralph Waldo Emerson (1983, 953–4) in “Fate”: “Nothing is more disgusting than the crowing about liberty by slaves, as most men are, and the flippant mistaking for freedom of some paper preamble like a Declaration of Independence, or the statute right to vote, by those who have never dared to think or act.”

⁷ See the opening chapters of Wiebe (1995). Also see Curti (1943, 134–43, 295–317) and Tyler (1944, 5–22, 47–67).

⁸ This constellation of concepts is famously traced in Pocock (1975).

schools, and literary societies (Cayton 1987, 605; Curti 1943, 357). A wide range of writers advised ordinary Americans as to how they might give themselves some of the skills and capacities that the upper classes could count on as their birthright.⁹ The question that guides this literature is how individual citizens might teach themselves the skills they need to make full use of the new material and political conditions they find around them. That these writers should stress self-cultivation is not surprising in an era when public education was still the preserve of the upper classes (Curti 1943, 363ff).

Modern scholarship has not been particularly sympathetic to the antebellum literature of democratic self-cultivation. For example, Cayton's (1987) influential essay on Ralph Waldo Emerson stresses what she finds to be elements of social control and class domination within the movement for democratic self-culture. Cayton (pp. 606–7) argues that local boosters and businesspeople in many American cities wanted to maintain moral order among the young men in their employ, and the self-culture movement was a means to inculcate business-friendly values. Cayton's work is typical of much recent scholarship on nineteenth-century moral didacticism in its debunking tone and its unwillingness to see that there might have been something more going on in this movement than mere moral indoctrination. Modern middle-class scholars who have had the advantages of a free public education and access to colleges and universities have not generally been very sensitive to the predicaments facing clerks and mechanics who were struggling to rise in society without the benefits of adequate training.¹⁰

Perhaps another reason for the modern scholarly disdain for this movement (and writers like Thoreau) is that the focus on the individual in the democratic self-cultivation movement seems to them to foreshadow the narcissism, privatism, and self-concern detected in our own era by some scholars (Lasch 1979; Putnam 1995). Certainly, one can never be too vigilant about the narcissism that individualistic societies tend to engender. But an anachronistic reading of our own reputed insufficiencies into the writers of the Jacksonian era underestimates the important functions democratic self-cultivation plays in periods of social and economic upheaval. Writers of that time were aware of the movement from a society in which people were given their social rank by an accident of birth to one in which a new mobility was available to most adult white males. The challenges and opportunities of mobility

made pressing the question of self-cultivation, and of education in general. Aristocrats had tutors, rhetoric instructors, and a college education to prepare them for the public sphere. How were those born to an average lot to achieve the capacities necessary for full civic participation? We have "no schools for ourselves," Thoreau writes in *Walden*, "our education is sadly neglected" (p. 71).

Recent scholars also may tend to underestimate the benefits of the self-cultivation literature if they do not recognize the importance of self-preparation in nonaristocratic societies. In market democracies, a great deal is at stake in the way dispositions and habits are formed. As Thoreau shows, the successful practice of self-cultivation can easily mean the difference between a life spent in freedom and a life caught in a spiral of desperation. Aristocrats can rely not only on an elaborate educational infrastructure but also on relatively secure liberties, since they are assigned these freedoms along with their estates and rank in society. By contrast, the liberties of citizens in a market democracy are often won by their own efforts and capacities. Not all individuals concerned with their dispositions and self-training are narcissistic; for some it may be a matter of survival or preparation.

As Neufeldt (1989) has pointed out, Thoreau's work has deep resonances with the literature of democratic self-cultivation. Thoreau owned a number of "young men's guides," and a passage in the opening section of *Walden* parodies this self-help literature (Neufeldt 1989, 103–5). But *Walden* stands out within the literature on democratic self-culture because it sees democratic citizenship as existing in tension with—rather than as supported by—the practices involved with everyday work, business, and enterprise. As Shklar (1991) and Wood (1992) have shown, the social revolution inaugurated by the founding generation had a radical influence on the way Americans understood the place of labor in life. The attack on aristocracy after the Revolution was cast in terms of an assault on idleness and leisure and brought with it a "heightened appreciation of the significance and dignity of labor" (Wood 1992, 277). Shklar (1991) has argued that the standing of American citizens was, from the beginning, tied up with their status as workers: Free democratic citizens neither labored in the degraded conditions of the slave nor loafed in the idleness of the aristocrat. When Thoreau writes in *Walden* of "serfs of the soil," of the need to move from noblemen to "noble villages of men,"¹¹ or of the servility of businessmen who contract and dilate their personalities (p. 4), he is wielding tropes taken from a discourse about aristocracy and slavery that was central to the language of democrati-

⁹ See Channing's "Self-Culture" in Robinson (1985). There is a good review of the literature of self-culture in Neufeldt (1989, 23–52) and Curti (1943, 355–60).

¹⁰ Cayton's (1987) article is illuminating but one sided. Her own sources offer an alternative view to the position she sets out. Cayton quotes the clerks and young lawyers of the Cincinnati Literary Society, who describe what they are doing as expanding "the wider culture of our intellectual, moral, and social powers" (p. 608). They see their efforts as the development of their capacities and skills, but Cayton imposes on this straightforward self-description a narrative about outside domination and business boosterism. She pays insufficient attention to the possibility that when the young men said that their literary society was a means to expand their own powers they knew exactly what they were doing.

¹¹ The passage is worth quoting in full, since it shows how entirely Thoreau shares his generation's vocabulary of democratic preparation and enactment: "As the nobleman of cultivated taste surrounds himself with whatever conduces to his culture, —genius, —learning, —wit, —books, —paintings, —statuary, —music, —philosophic instruments, and the like; so let the village do, —not stop short at a pedagogue, a parson, a sexton, a parish library and three selectmen. . . . Instead of noblemen, let us have noble villages of men" (p. 72).

zation in his day.¹² The radicalism of Thoreau's perspective consists in his suggestion that, far from generalizing access to the liberty and dignity that the aristocratic classes enjoyed, everyday working conditions in America might merely be generalizing toiling desperation. This is why *Walden* is a work of democratic-advice literature. Thoreau sees the conditions of American employment as the most stubborn obstacle to the enactment of real freedom.

It should be noted that Thoreau does not think that all Americans—not even all those who are economically vulnerable—will necessarily need the strategies he sets out. He explicitly exempts from his arguments all who can, on reflection, describe themselves as well employed, however that might be (p. 10). And some people, he suggests, are so strong and valiant that they would come out well anywhere. To these, he emphasizes, he will not speak (p. 9). Thoreau also excludes from his concern those who have inherited (or dishonestly attained) wealth (p. 164). By exempting from his discussion anyone who feels a comfortable meshing between work and liberty, Thoreau traces out an audience of those who labor *without* a calling, a group rarely addressed within American literature.

AN EXPERIMENT IN PHILOSOPHY

How does one address the predicament of the mass of people who try to enact liberty and their own particular vision of the good without being able to rely on inherited wealth or standing? How might the myriad blessings of modern technology and productivity be unlocked for the class of people apparently so ill-served by modern developments? "I wish to show at what a sacrifice [the advantage of modern civilization] is at present obtained, and to suggest that we may possibly so live as to secure all the advantage without suffering any of the disadvantage" (*Walden*, 20). At issue is how those who have trouble getting a living nonetheless can come to achieve what Thoreau believes he has achieved, namely, the ability to escape misery and desperation, and how they can learn to find "encouragement and inspiration in the present condition," even to the extent of "cherish[ing] it with the fondness and enthusiasm of lovers," as Thoreau says that he himself does (p. 10).

After passing in review a number of the typical occupations of his day, Thoreau introduces the strategy which he believes offers the best alternative to the "enslavements" (p. 4) that everyday work life so frequently entails. He suggests that moderns who seek to enact democratic liberty have much to learn from the ancient philosophical schools of various nations. "The ancient philosophers, Chinese, Hindoo, Persian and Greek, were a class than which none has been poorer in outward riches, none so rich in inward" (p. 9). What Thoreau finds particularly attractive in these schools is

their strong emphasis on bringing wisdom to bear on the practices of everyday life. "To be a philosopher is not merely to have subtle thoughts, nor even to found a school, but so to love wisdom as to live according to its dictates, a life of simplicity, independence, magnanimity and trust. It is to solve some of the problems of life, not only theoretically, but practically" (p. 9). The "independence" in this passage is important. In developing his democratic experiments outside of schools and other institutions, Thoreau sees himself as returning to a philosophical independence abandoned by many modern philosophers. As Thoreau puts it, "the success of great scholars and thinkers is commonly a courtier-like success" (p. 334). The worry that philosophy may be undermined if the working conditions of philosophers become too courtier like—toadying to superiors, courting public reputation, establishing power blocs, and so on—is part of a general criticism in *Walden* of those forms of life in which participants' stated goals (love of wisdom in philosophy, love of freedom and independence among everyday citizens) are mangled in their enactment and are thus not adequately embodied in the occupations people adopt to realize them. He thinks more "Yankee" shrewdness needs to be applied to resolving the tensions between our higher order values and the practices of our everyday work life.

The idea that ancient philosophy may offer the key to modern work predicaments goes back very far in Thoreau's thought. Early in his *Journal* (Lebeaux 1977, 80) he wrote that "Zeno the Stoic stood in precisely the same relation to the world as I do now. . . . Bred a merchant . . . he strolls into a shop and is charmed by a book by Xenophon and straightaway becomes a philosopher." The key to *Walden* is the way it combines ancient philosophical practices and modern economic calculation to set out a strategy by which citizens may realize their liberty.¹³ The seriousness with which the ancient philosophers took the challenge of maintaining their poise in the pursuit of the good, and their willingness to reform the practices of their everyday life so as to reflect their higher values, become the central attitudes that can enable a democratic citizen to reopen the space of freedom at the level of daily life.

Thoreau's description of a philosopher as someone who solves "the problems of life" may at first reading appear to be a fundamental misunderstanding of ancient philosophy. After all, in the works of Plato and Aristotle, which are the focus of our contemporary curriculum in the field, the philosopher's development of wisdom and insight leads him away from political involvement and creates a marked tension with the political life of the *demos*. Philosophy is defined in contrast to, and in many ways as an alternative to, everyday democratic life.

Thoreau was a well-trained classicist, one of the best of his generation (Sattelmeyer 1988, 7), but the Harvard curriculum of his day gave less exposure to Plato and Aristotle than to such writers as Cicero and the

¹² Dawson (1996, 36) has pointed out that the first English usage of "democrat" was as a term of contrast with aristocrats during the French Revolution and in that era was generalized to refer to all those with antiaristocratic sentiments.

Stoics, who emphasized a more complex relation between philosophic practice and political life (pp. 7–8).¹⁴ Thoreau's principal classics teacher, Eliot Professor of Greek Literature C. C. Felton, encouraged his students to see the close connection between classic literature and the everyday life of ancient peoples (pp. 7–8). Moreover, Thoreau's vision of ancient philosophy comprised Chinese texts, such as the *Analecets* of Confucius, which are quoted throughout *Walden* (Cady 1961), as well as numerous Indian texts, such as the *Laws of Menu*, the *Bhagavadgita*, and the *Vedas*, all of which put a strong emphasis on philosophy as a form of advice on how to live as an ordinary householder.¹⁵ All these traditions gave the philosopher a large role in acting as an example and in setting out pathways for others to follow as they confronted the challenges of everyday life.

As many recent scholars have stressed, the relation between the ancient philosopher and the political realm is considerably more complex than the simple question of whether the philosophically enlightened citizen will participate in politics.¹⁶ While one strain of ancient thought encouraged a turn away from political life, another looked on philosophy as ideal training for public affairs, since it taught how to preserve moral integrity amid the tumult of political struggle (Foucault 1984; Sandbach 1989, 107). Philosophers frequently found employment as tutors and advisors in powerful households, teaching politically involved citizens how to balance political position, public functions, activities, and obligations (Sandbach 1989, 16–8). Given the constant fluctuations and reversals of political life in the ancient world (in some ways comparable to the fluctuations and reversals of work life in modern times), the citizen needed to stabilize his desires and sense of self so as to maneuver with maximum flexibility, to show himself capable of ruling, of being ruled in turn, and of holding high office while resisting the temptations of corruption and immorality (Foucault 1984, 114–5).

One reason philosophers came to be seen as fitting advisors to citizens and rulers was that they were versed in exercises by which individuals learned to bring their passions and desires under control (Rabbow 1954, 112–50). To operate well as a citizen or ruler one had to learn attention, concentration, and resistance to temptation. None of these capacities are ever easy for humans to attain, plagued as they are by anxiety, greed, and fear. Thus, much of the training in the ancient schools was designed to help people circumvent the temptation of their passions. For example, the Epicureans formulated various aphorisms to quell fears and

realign the individual with the natural world. One of these, discussed in Hadot's illuminating book on ancient philosophical practices, is the so-called *tetrapharmakon*: "God presents no fears, death no worries. And while good is readily attainable, evil is readily endurable" (Hadot 1993, 26; author's translation). Philosophers could teach a range of exercises and strategies to help people navigate the everyday temptations and obstacles of political life while preserving their moral integrity and political reputation. *Walden* is a modern revival of this tradition. Thoreau uses the narrative of his experiment at Walden Pond to show how the resources of ancient philosophy can be used by those who find themselves vulnerable within the modern market system. As I show in the next section, the similarity lies not just in general attitude; the practices and exercises Thoreau sets out in *Walden* are functionally identical to the techniques found in ancient philosophy.

EXERCISES, STRATEGIES, AND REPLACEMENT PRACTICES

Thoreau advocates a number of exercises and practices as means of offsetting the forces that threaten autonomy, liberty, and happiness. (1) Thought experiments can clarify our relation to our fundamental needs and thereby counteract anxiety. (2) Maxims can be coined to offset the autonomy-hampering effects of public opinion. (3) Household accounting methods, centered on autonomy, can establish an equilibrium between one's higher order goods and the practices of everyday life, particularly with regard to the relation between work and leisure. (4) Replacement practices can be developed to encourage individual flourishing while offsetting both economic dependency and social relations of exploitation. (5) Ways of approaching nature and the physical world can be designed to expand and train the self and especially the body as well as to open to nature in a way that makes it more than just a tool of human needs. (6) Dietary and sumptuary strategies can be adopted to promote the various goods set out above.

In line with my suggestion that *Walden* is a work about democratic enactment for those facing uncongenial employment choices, these practices and exercises can be separated into two categories. On the one hand are those meant to liberate the time and tranquillity needed to elaborate projects expressing one's personal autonomy (practices 1 through 4). On the other hand are those more exclusively tied up with Thoreau's own individual sense of the good life, the particular perfectionistic doctrines to which he adheres. These include the observation of nature by living in a cabin in the woods rather than in a small apartment in the city, and so on.

I make this distinction because each category admits to different degrees of generalizability. Practices in the first group are generally relevant to most citizens who are interested in preserving their freedom under conditions of market democracy. Many in the second group can only be interpreted as reflections of Tho-

reau's personal tastes and inclinations, such as his dislike of tea or preference for country living. These are not relevant to as many people as is the advice Thoreau gives about the maintenance of liberty in the world of a potentially overwhelming labor environment. Thus, I concentrate primarily on the first category of practices in claiming Thoreau as a philosopher of democratic enactment. They illustrate how Thoreau reformats ancient philosophical practices as elements of a democratic politics of example to address the tension between work and autonomy in the everyday life of market democracies.

Thought Experiments to Offset Anxiety

Thoreau believes that one of the great obstacles to autonomy is anxiety. Self-governance, which is to say the ability to guide ourselves by the lights of our own developing sense of the good, requires a certain poise and presence of mind that is easily lost in a complex existence with many cares. For example, worries about long-term economic security can easily lead to a harried life that soon subverts the ends sought through pursuing such security.

Thoreau shows that, for a correct balance of ends and means, our calculus of liberty must take as its base point a well-understood knowledge of our most fundamental physical needs. These play such a large role in our struggle for freedom that Thoreau capitalizes them as if they were deities: "The necessities of life for man in this climate may, accurately enough, be distributed under the several heads of Food, Shelter, Clothing, and Fuel; for not till we have secured these are we prepared to entertain the true problems of life with freedom and a prospect of success" (*Walden*, 7).

In the second half of the "Economy" section Thoreau guides the reader through a set of thought experiments designed to sensitize them to the border between what they do and do not need in terms of fuel, shelter, clothing, and food. These exercises cultivate a disposition to distinguish between what one needs as a physiological organism and what public opinion and habit make one think one needs. An ability to step away from the sense of the socially necessary then allows room for maneuver; one is no longer locked into a set of trade-offs between anxiety-producing complexities and an unreviseable set of goods. An example of Thoreau's strategy here can be found in his section on shelter:

If one designs to construct a dwelling house, it behooves him to exercise a little Yankee shrewdness, lest after all he find himself in a workhouse, a labyrinth without a clew, a museum, an almshouse, a prison, or a splendid mausoleum instead. Consider first how slight a shelter is absolutely necessary. I have seen Penobscot Indians, in this town, living in tents of thin cotton cloth, while the snow was nearly a foot deep around them, and I thought they would be glad to have it deeper to keep out the wind (p. 18).

There are numerous noteworthy elements in this passage, but I will point out just a few. Note the parallel between Thoreau's strategy and the second part of the Epicurean *tetrapharmakon*, which states that the good

is readily attainable, evil is readily endurable. Thoreau tries to remove the sting of autonomy-harming anxiety by stressing that it is easier than we think to have the goods we need and endure even the greatest local evils, which in New England is foremost the winter's cold. Thoreau addresses each of the necessities of life in turn and through a similar set of reflections gives readers a more realistic vision of what they really need and what is a luxury (a luxury, that is, if they are concerned above all to maintain their autonomy). Ancient philosophy was replete with such therapies aimed at clarifying our vision of nature so as to release us from potentially harmful passions and anxieties.¹⁷ Thoreau's strategy is the same as in the ancient techniques, although Thoreau is careful to cast his arguments in terms of values his audience already holds; for example, he asks why the Yankees who are so shrewd about building machines and forming commercial enterprises nonetheless permit their lives to sink into desperation.

Notice also the didactic use Thoreau makes of the Indians. He consistently refers to Native Americans as having managed to work out a relation with the necessities of life which did not force them to lose their liberty—which allowed them to live in the realm of stark necessity while being ingenious enough to have maintained forms of real richness (p. 19), liberty, and comfort (p. 21). Throughout *Walden*, Native Americans exemplify a population living in relation to the New England climate in a way that allows them to maintain their freedom and happiness without the problems Thoreau sees his fellow countrymen facing.

Maxims to Offset the Effects of Public Opinion

In the Hellenistic schools and in other ancient philosophical traditions, such as Confucianism and Buddhism, adherents memorized maxims that summed up the complex moral and physical attitudes advocated by their school.¹⁸ These short sayings were used as a guide in daily life, as a source of moral orientation amid constant choices, dilemmas, and stress. Maxims in *Walden* play a similar role. Thoreau is elaborating a new ethos of everyday life, and *Walden* has a place in it analogous to *Poor Richard's Almanac* in the ethos he is calling into question. The maxims in *Walden* sum up and reinforce a particular attitude toward work and time, rendering the ethos into portable form for use in daily life.

Thoreau employs maxims as a means of stabilizing the new ethos he is developing in the face of public opinion, which continually threatens to upset it: "The cost of a thing is the amount of what I will call life which is required to be exchanged for it" (p. 19). "Money is not required to buy one necessary of the soul" (p. 213). "How can he remember well his igno-

rance—which his growth requires—who has so often to use his knowledge” (p. 3)? “Simplify, simplify” (p. 60). These maxims are meant to stick in the mind and to generate the dispositions that ground the replacement ethos.

Thoreau mirrors John Stuart Mill in his sensitivity to the autonomy-hampering effects of public opinion in a mass democratic society and to the threats that public censure poses to liberty. But Thoreau's economic vulnerability as a day laborer led him to insights Mill missed. Most important is Thoreau's suggestion that the most dangerous influence of public opinion may well be in the way it shapes our attitudes as consumers, misleading us into thinking that we can afford things we cannot (not, at least, if we want to maintain our autonomy). Public opinion can create within us autonomy-harming ideas about what our needs truly are. The maxims studding Thoreau's text are designed to help readers remind themselves that, from the perspective of their fragile freedoms, many more items may turn out to be luxuries for them than they may at first think.

An Alternative Household Economics

Thoreau's reflections are based on the assumption that people are forced to be self-supporting, but that freedom entails an ability to maintain contact with one's ideals, with what Thoreau terms “proper pursuits” (*Walden*, 18). In modern conditions, he suggests, that may be possible only with the most simplified life, since the means by which one gains the resources for a complicated existence are very likely to destroy the time and psychic poise needed to keep a firm grip on what are and are not one's proper pursuits. Thus, individuals who are threatened with a desperation-producing work life may find it useful to revise their basic wants and needs downward.

Thoreau advances a number of formulas and maxims to help the individual achieve an acceptable equilibrium between the need to preserve autonomy and the need to gain the necessities of life (Stull 1984). Some were cited above. But there are also more general algorithms for determining what is affordable if one ranks the maintenance of autonomy as a high priority. One such equation is the following: “The cost of a thing is the amount of what I call life which is required to be exchanged for it, immediately or in the long run” (p. 19). As Richardson (1986, 166–7) has pointed out, Thoreau was a careful reader of the works of Adam Smith, Ricardo, and Say, and the aforementioned formula is a virtual paraphrase of Smith's definition of cost in *The Wealth of Nations*. As Thoreau says in *Walden*, “economics is a subject which admits of being treated with levity, but it cannot be so disposed of” (p. 18). “He must be a great calculator indeed who succeeds” (p. 60). Thoreau gives sample account books for a household economy centered around creating a space for liberty, offering an example of an accounting practice that takes freedom seriously (pp. 31–40). He shows how an everyday practice (drawing up the household accounts) can be reformatted as a means of enacting liberty in the daily life of average citizens.

A Pattern-Book of Practices

Much of *Walden*, and of Thoreau's work elsewhere, focuses on the creation of practices which might serve as a better means to realize autonomy than the customary work practices of Concord. *Walden* is a pattern-book of replacement practices to help people elude the financial dependency that leads to desperate lives within ostensibly free societies. Much of Thoreau's ingenuity in *Walden* and in his miscellaneous essays is devoted to showing how the entirely banal practices of everyday life—walking, talking with friends, botanizing, reading and writing, doing day labor—can be rethought and reconstructed to enhance autonomy. *Walden* is an attempt to work out an acceptable culture—that is, practices, exercises, and dispositions—that will render poverty livable. Replacement practices aim to make poverty lush rather than barren, and thus disclose it as a position which individuals might choose if they felt their liberty threatened by the standard work life they encounter. Native Americans and ancient philosophers were able to create fully satisfying lives in conditions of great material poverty, and it is not unreasonable to believe that amid the much greater material wealth of bustling America such savage comforts (p. 21) may be even more easily attainable.¹⁹

Using the material advantages of our society, we can work out replacement practices that take advantage of any comforts available to us within a position of poverty. The aim is to escape boredom, avoid despair, maintain our financial independence, extend our faculties, and open up a space to express our autonomy. Thoreau's discussion of replacement practices generally follows a standard pattern. After examining the customary way of achieving particular ends, Thoreau explains why the standard practices should be questioned and perhaps rejected. He then offers his own approach and discusses how it enhances autonomy.

A good example is the practice of walking, which Thoreau discusses both in the essay *Walking* and in *Walden*. He concentrates not on walking for exercise or as part of business but on the most banal of all forms, strolling around out of doors with no real purpose in mind: “I think that I cannot preserve my health and spirits, unless I spend four hours a day at least—and it is commonly more than that—sauntering through the woods and over the hills and fields, absolutely free from all worldly engagements” (Thoreau [1862] 1993, *Walking*, 50–1).

The customary practice to which Thoreau contrasts his ideal of sauntering is that of staying inside all day—not so much inside a building as inside the cares and problems of one's work and home life. *Walking* and the numerous other passages in Thoreau's works devoted to the benefits of sauntering are really about the

¹⁹ “Though we are not so degenerate but that we might possibly live in a cave or wigwam or wear skins to-day, it is certainly better to accept the advantages, though so dearly bought, which the invention and industry of mankind offer. . . . With a little more wit we might use these materials so as to become richer than the richest now are, and make our civilization a blessing. The civilized man is a more experienced and wiser savage” (pp. 25–6).

relation between labor and leisure and about setting out strategies so that one may work without occluding one's self and sense of the good.

Thoreau also contrasts beneficial walking to the sort during which one just ruminates about housework or other cares: "Of course it is of no use to direct our steps to the woods, if they do not carry us thither. . . . It sometimes happens that I cannot easily shake off the village. The thought of some work will run in my head and I am not where my body is,—I am out of my senses. In my walks I would fain return to my senses" (*Walking*, 52). He argues that walking can be used to regain contact with one's bodily senses, and with nature, so as to remove oneself mentally from the world of work. "What business have I in the woods, if I am thinking of something out of the woods" (*Walking*, 52)? In Thoreau's work the exercises that return us to everyday experience are valued because they refresh the faculties and give the self a ballast outside public opinion and standard custom (pp. 72–3). This, in turn, allows one to make better judgments about the choices that come up in everyday life. This is but one example of the many replacement practices Thoreau envisions and recounts.

My argument is that something more went on at Walden Pond than mere moral perfectionism. To read *Walden* as nothing more than Thoreau's working out of "private business," his personal attempt to answer the question "How then shall I live?" misses the large sections of the book that are sincere and nonparodistic attempts to write a workable piece of democratic-advice literature aimed at those whose liberty is threatened by their employment. The first five and the last five pages of *Walden* are very straightforward about addressing an audience made up of the poor and others whose work lives threaten to subvert their "proper pursuits." One can only see *Walden* as a parody of advice literature if one focuses on a few satirical sections and ignores the harrowing discussion of human toil and desperation on its opening pages. *Walden* is a democratic-advice book for the poor and work-weary (p. 1).

THOREAU'S ALTERNATIVE ECONOMICS

In 1851, Thoreau ([1906] 1951, 164) wrote that the question of getting a living is "the most practically important of all questions" because everyone must answer it before going on to explore and then express the possibilities of freedom. The very structure of *Walden* mirrors and reinforces this message. It opens with "Economy," a section in which Thoreau focuses on mundane worries, such as employment, food, shelter, and livelihood. But once these self-oriented issues are addressed, he turns to the world outside—the community in Concord and the contemplation of nature. Thoreau is one of the first moderns to develop an idea of the physical environment as an autonomous presence toward which human beings have some accountability, a dialogic partner with its own interests and processes rather than just a tool for human ends (Buell 1995, 7–8). The book may begin with a certain

degree of self-concern, but this is just a stepping stone on the way to a greater objectivity.

The rhetorical conventions of *Walden*, with its quasi-allegorical history of the individual soul's progress from the mundane world of business and self-centered worries to participation in a suprahuman realm beyond, with "new, universal and more liberal laws" (p. 209), links it to other philosophical allegories, such as Plato's *Republic*. But in contrast to the philosopher-sage Socrates, who justifies an aristocratic politics of guardianship, the democrat-sage Thoreau illustrates strategies that can make the individual self-reliant.

Perhaps the best way to understand the exercises and practices advocated in *Walden* is to see them as a form of ethico-political athleticism that Thoreau hopes may inspire and liberate others. In the same way that a great athlete can inspire us to greater effort and grace, so Thoreau acts out writ-large versions of democratically pertinent skills, such as self-direction, the maintenance of ideals, economic awareness, and frugality. He writes frequently of the importance of setting examples, even if they may seem dauntingly strenuous: "Be sure that you give the poor the aid they most need, though it be your example which leaves them far behind" (p. 49). An 1851 journal entry reads: "If you would convince a man that he does wrong, do right. But do not care to convince him. Men will believe what they see. Let them see" (Thoreau [1906] 1951, 46). "Does Wisdom work in a tread-mill? or does she teach how to succeed by her example?" (Thoreau [1862] 1993, 79). Through recounting his experiments by the pond, Thoreau hopes to inspire his readers to question choices and decisions they make unthinkingly and perhaps adopt a more rigorous household economics, one that takes their life goals into account. Thoreau reformats the familiar republican vocabulary about preserving liberty through resisting luxury and renders it applicable to the case of individual citizens attempting to make their way as laborers in a modern market economy.

But Thoreau was well aware that the strenuous practices and exercises he advocates will not appeal to all. He carefully includes in *Walden* an episode of failed advice-giving through which he meditates on the stringency of his example. In the chapter "Baker Farm," Thoreau encounters an Irish immigrant and his family in a shack near the pond. The Irishman, John Field, labors day and night for a local farmer hoeing a bog but never seems to get ahead. Thoreau summarizes for him an autonomy-oriented household economics based on extreme simplicity.

John heaved a sigh at this, and his wife stared with arms a-kimbo, and both appeared to be wondering if they had capital enough to begin such a course with, or arithmetic enough to carry it through. It was sailing by dead reckoning to them, and they saw not clearly how to make their port so; therefore I suppose they still take life bravely, after their fashion, face to face, giving it tooth and nail, not having the skill to split its massive columns with any fine entering wedge, and route it in detail;—thinking to deal with it roughly, as one would handle a thistle. But they fight at overwhelming disadvantage,—living, John Field, alas! without arithmetic, and failing so (p. 134).

Thoreau, it is obvious, was well aware of just how radical his austere household economics would appear to some of the readers he was addressing.

We might think that Thoreau overestimates the degree of freedom open to people who live in conditions of poverty and does not adequately recognize the predicaments poverty can bring; the way in which the attainment of freedom is complicated by having to fend for both self and family, for example. We might also find that Thoreau does a poor job of accounting for the importance of cultural capital. Not all poor people have an intact family on which to rely, draw benefit from a Harvard education, and live in a community as vibrant as that of antebellum Concord. To be completely satisfying, Thoreau's alternative economics would have to take all these things into consideration and also would have to reflect more articulately on the weight of structures and institutions. Still, no book can do all things, and *Walden* does bring considerable illumination to the issues it touches. The book insists that America is "comparatively free" and that strategies to circumvent any disadvantages in its institutions are thus both thinkable and pursuable. Thoreau's strategy is certainly not based on any illusions about the grimness of poverty. Indeed, few northern writers of this time paid as much attention as Thoreau did to the fate of poor laborers, to the people living in human sties by the railroad tracks: "The forms of both old and young are permanently contracted by the long habit of shrinking from cold and misery, and the development of all their limbs and faculties are checked" (p. 22).²⁰

Thoreau clearly does not romanticize poverty, but he does refuse to see all poor people as similarly situated with regard to life and choice. He forcibly reminds us by his own example that there is a great diversity in the experience and capacities of poor people, that economic poverty can coexist with widely varying degrees of social capital, and that poverty is not in all cases the worst of afflictions. Thoreau is less likely than some middle-class writers to see poverty as intrinsically and in all cases a barren and liberty-destroying condition.²¹ *Walden* questions the automatic connection we make between economic improvement and increased liberty by pointing to groups such as Native Americans and ancient philosophers, who maintained liberty in conditions of poverty, and to the workers of Concord, whose

freedom often diminished as their economic life improved. These arguments are not frequently heard in American political thinking.

CONCLUSION

The best way to read *Walden* is to see it as addressing people in all classes who have talents and tastes that are not adequately mirrored in the lifeways deemed to be profitable in their time. *Walden* is designed to render readers more sensitive to their choices about the place of work in their lives and about the trade-offs they make between their freedom and their consumption goals. Thoreau's strategy of voluntary poverty as a means to liberty and the development of one's own projects is designed for people with a strong sense of their own autonomy who might conceive of projects that cannot be realized through their work. Certainly, not all people have these characteristics. But as social scientists from Weber onward have shown, the modern employment system tends to produce highly disciplined individuals able to eschew short-term comfort in the name of more evanescent goals (Weber 1958, 180–3). The system that produces the sorts of dilemmas Thoreau addresses is also likely to reproduce the forms of character that would allow the strategies in *Walden* to make sense to people.

Thoreau's strategies are but one part of the political theory necessary to address the tensions between employment and freedom found in modern democracies. We also need to explain the structural changes in economic and political systems that allow these tensions to persist. But in terms of the immediacy of its advice and of its utility for individual citizens, *Walden* is thus far without parallel. In *On Liberty* Mill suggests that it is important for democratic societies to produce individuals who might make experiments in living and thus serve as generative centers of innovation for their society, illustrating escape routes from the tyranny of majority custom (Collini 1989, 69–70). Thoreau's *Walden* is an exemplary account of one such experiment in living, and one which shows a constant awareness of the exemplary functions of its innovations. It contains an array of suggestions for practice that readers might take up as part of their own democratic activity. As a democratic-advice book, *Walden* has a proximity to action that contemporary political theory often lacks. Much modern political philosophy is a philosophy of postponement, in the sense that the extension of liberty entails waiting for a collective social actor willing to put radical changes into practice—the proletariat finally coming to consciousness or a constitutional convention finally being convened and bringing about the redistributions of Rawls's (Rawls 1972, 195–201) difference principle. The thrust of much modern political theory of this sort is to postpone our political activity to some distant day. There is a utility in Thoreau's focus on immediate enactment, on the possibility that we might "adventure on life now" (p. 9), and in his emphasis on showing us how it might be done. Citizens, after all, have to fight for their freedom in the here and now, in the (it is hoped) brief period before the institutional

²⁰ Nor did most abolitionists draw explicit parallels between wage labor in the North and slavery in the South, as Thoreau did. "I sometimes wonder that we can be so frivolous, I may almost say, as to attend to the gross but somewhat foreign form of servitude called Negro Slavery, there are so many keen and subtle masters that enslave both north and south" (Thoreau [1854] 1995, 4). This gives us some idea of the gravity with which Thoreau observed northern work conditions, since such comparisons were usually the stock of proslavery discourse in the South (Fitzhugh [1857] 1960; Grayson 1856).

²¹ Indeed, Thoreau believes that in some cases a fear of poverty keeps individuals from adopting a principled political position and leads them to acquiesce in immoral policies. Adopting poverty may thus be a crucial step toward enacting one's liberty, as is suggested in the passage from *Civil Disobedience* quoted above (Thoreau [1862] 1993, 4).

designs of political philosophers and activists are finally realized.

Walden also has a number of advantages as a work through which to understand democratization in nineteenth-century America. Unlike some European visitors, Thoreau clearly saw the inequalities in the United States in the antebellum period, and he specifically warned against ignoring the poor: "It is a mistake to suppose that, in a country where the usual evidences of civilization exist, the condition of a very large body of the inhabitants may not be as degraded as that of savages. I refer to the degraded poor" (p. 22). Nonetheless, Thoreau refuses to see poverty as in itself an affliction and believes that we underestimate the possibility of rendering it tolerable. He also shows great attentiveness to the social and political ramifications of such economic changes as the expansion of the commercial press, the growth of new means of communication and transport, and the development of new forms of labor. Much of his thinking is focused on themes that later writers, such as Habermas (1987), theorize as the colonization of the lifeworld—the expansion of economic and political systems into the dense web of unreflective practices and tacit understandings that make up our customary life.

Thoreau's analyses of this process are neither apocalyptic nor overly optimistic, and his concern throughout is practical. His central goal is to show how the disadvantages of the modern era can be circumvented while its advantages are secured (p. 20). It is this willingness to celebrate the conveniences of a market society and at the same time recognize the realization of liberty within its conditions requires high levels of imagination, creativity, and self-control that makes *Walden* such an interesting work for democratic theorists in an era of economic restructuring. Thoreau brings serious thought and sustained experimentation to bear on an area of life seldom examined within our tradition—the border between our individual life-projects and the means we adopt to make our living. In a time such as ours, which has seen the spread of employment to new populations and a deep restructuring of work conditions, *Walden* may well be one of our most resonant and useful works of political theory.²²

²² *Walden* is a work of political theory because a central concern is the realization of liberty for citizens of modern market democracies, and it explores this question with frequent references to the language of democratization current in the antebellum period.

When the Party Breaks Up: Exit and Voice among Japanese Legislators

JUNKO KATO *University of Tokyo*

In exploring the conflicts between individual interests and the conditions that facilitate the disintegration of a political party, this article modifies the exit, voice, and loyalty framework developed by Hirschman. The utility of that framework is examined using the recent change in Japan, that is, the demise of the so-called 1955 system, in which the predominant conservatives confined the socialists to the status of a major but perennial opposition party. The quantitative analysis focuses on the split of the Japanese Liberal Democratic Party and the internal dispute in the Democratic Socialist Party of Japan. These cases provide an interesting comparison of how individual characteristics and contextual conditions affect members' decisions to exercise exit and voice. At the same time, they illuminate how party-level changes have been influenced by intraparty factors.

Parties are important agents of political change in contemporary democracies. Some studies focus on interaction and bargaining among parties as catalysts of systemic change (Budge and Keman 1990; Downs 1957; Laver and Schofield 1989); others are concerned with the distinctive influence of parties on the shape of national agenda and policies (Blais, Blake, and Dion 1993; Cameron 1978; Hicks and Swank 1984, 1992). The existing research, because of its ultimate concern with systemic consequences and changes, tends to regard the party as the unit of analysis and rarely examines individual politicians, whose interests and behavior should be important determinants of intraparty dynamics. Their motivation to be members of a party is closely related to party unity and coherence and thus ultimately influences the entire political system. In a parliamentary democracy, for example, the legislative majority forms a cabinet, and so the unity of parties as well as interparty bargaining are important factors in the durability of party government. Conversely, in a presidential system with less coherent and loosely organized parties, as in the United States, a politician's motivation to be affiliated with a party is itself a subject of interest, because the party coexists with the pluralistic, atomistic competition of individual legislators.

This article explores the conflicts between legislators' interests and the conditions that facilitate the disintegration of a political party. The analytical framework focuses on members' motivations to stay or quit the organization and is based on the exit, voice, and loyalty explanation developed by Hirschman (1970). The original model is significantly modified, however, in terms of how member preferences affect exit and voice. The framework is examined in the context of the

recent demise of the so-called 1955 system in Japan, a system in which the predominant conservatives confined the socialists to a major but perennial opposition party. The analysis focuses on the split in the Japanese Liberal Democratic Party (LDP) in 1993 and the internal dispute in the Social Democratic Party of Japan (SDPJ; formerly the Japan Socialist Party, JSP) in 1994 and 1995.¹ They provide interesting cases for a comparison not only of how the two political parties coped with the crisis but also of how intraparty factors influenced the system-level changes. As the following section will explain, the LDP's split brought about a major shift in Japan's postwar party system, that is, the end of conservative predominance. Also, the SDPJ's internal disputes have been an important cause of the rapid rise and fall of coalition governments since then.

The LDP broke up in June 1993. Despite intraparty disagreements about election and political finance reforms as well as party management, the split appeared premature. Because majority power in a parliamentary system gives an enormous advantage to individual members, it is considered unlikely that they will dismantle their own party. The LDP case challenges this conventional wisdom. The party had experienced no significant decline in popular support, despite public criticism of its implication in a political scandal. In contrast, the socialists managed to maintain party unity until the formation of the Democratic Party in September 1996 caused a major split. This was notable given an internal dispute about traditional party policy positions and a decline of electoral support.

Through a quantitative analysis, this article explores how the behavior of individual politicians is related to party dynamics.² This perspective is still new in the study of Japanese politics. In addition to the motivation of individual members, the utility of the exit, voice, and loyalty framework will be examined. More specifically, I will argue that the ability and/or propensity to exit magnifies voice in political organizations, and that the members who are the first to exit are most active in

exercising voice.³ Empirical evidence from Japan is used to demonstrate the characteristics of a political organization, especially a party, that contribute to this tendency. My argument is diametrically opposed to the trade-off relationship between exit and voice in Hirschman's original formulation. In the following section, I will set out a general framework for analyzing party politicians' organizational behavior and clarify the critical modification of Hirschman's model made in this analysis.

EXIT, VOICE, AND LOYALTY: AN ALTERNATIVE APPROACH TO PARTY ORGANIZATION

Hirschman's (1970) exit, voice, and loyalty framework is based on consumer response to the deterioration of quality in a product. Some people cease to buy that product and switch to an alternative (exit); others continue to buy it and inform the producer of their demand that quality be restored or improved (voice). The decision hinges mainly on rational calculation of the expected costs of exit and voice but is also influenced by loyalty to the product and, ultimately, to the firm. The normative implications of Hirschman's framework are that the postponement of exit and the promotion of voice are important for halting quality decline in the first place, and that an effective combination of exit and voice is ultimately required for the recuperation of the organization (in his original case, a firm). My modifications of the model make it applicable to organizational behavior in politics.

Responses to Organizational Performance and a Cleavage between Activists and Nonactivists

Hirschman's formulation implicitly assumes universal agreement on the definition of product quality. In the analysis of consumer behavior, for example, the deterioration is assumed to be reflected in a decline in demand, which suggests that consumers uniformly respond to a quality change as they do to a price change (Hirschman 1970, Appendix A). Therefore, exit is a primary response to quality deterioration, but loyalty may encourage consumers to use voice. This premise becomes problematic when the model is applied to a political organization. The service or gain that members enjoy from their association with a political organization (a party in this study) is analogous to the product in the market situation. In the political context, however, members may have completely different ideas about the kind and level of service the organization should provide as well as different evaluations of the current quality. There is an important demarcation between those who actively respond to the "deteriora-

tion" through exit or voice and those who support maintaining the status quo (due to their insensitivity or their different point of view) and do neither.⁴ When a political organization engages in the provision of a public good, this demarcation becomes even more salient than when the organization's members are concerned only with the consumption of a private good.

A Public Good and a Collective Good

Hirschman (1970, 98–105) gives the example of government officials who stay in the organization to provide a public good, that is, a government policy. Legislators who belong to a political party produce public policy, and members of the dominant party make policy that is very likely implemented as government policy. In both cases, exit and voice calculations can be greatly affected by a person's attitudes toward the public goods (or bads) that the organization produces.

The member will compare, at any one point in the process of deterioration, the disutility, discomfort, and shame of remaining a member to the prospective damage which would be inflicted on him as a prospective nonmember and on society at large by the additional deterioration that would occur if he were to get out (Hirschman 1970, 103).

These members weigh the personal loss incurred by a decline in their organization's reputation (a collective good for the organization members) and the loss to society (including themselves) that would ensue from the deterioration of a policy (a public good). In this regard, the quality of the public good *produced* (a policy) by the organization matters as much as the quality of the collective good *consumed* (the reputation) in the decision to choose between exit and voice.

These behavioral patterns would change, however, if two assumptions implicit in Hirschman's framework were abandoned. The first is that members as well as society at large respond uniformly to the declining quality of the public good. Thus, in Hirschman's formulation, all the members recognize the quality decline in both the public good and collective good at the same time. Conversely, I assume that the evaluation of both the public and collective good differs from one individual to another. Furthermore, attitudes toward them tend to be more varied than attitudes toward a private good, such as a salary. For example, whereas some may be concerned about deterioration in an organizational policy, others may see none, and thus the reputation of the organization would not necessarily be seen as declining. It is possible to imagine a case in which members are worried about the declining reputation of an organization but believe it is providing a high-quality public good. The primary difference among members, therefore, lies in their perceptions of overall

³ This is the argument presented by Bates and Lien (1985). They point to the tendency in developing nations for the owners of mobile factors, who can evade heavy taxation by exit, to give voice more actively than the owners of immobile factors, who cannot exit. For a comprehensive criticism of Hirschman's Framework, see, for example, Barry (1974).

⁴ Hirschman (1970, 50–1) believes that such a demarcation becomes salient in the exceptional case of quality-conscious consumers responding sensitively to a quality decline. He also suggests that these consumers closely parallel members of a political organization who resort first to voice when they disagree with organizational activity.

organizational performance (including both its policy and reputation) rather than their response to it. The present framework assumes that "active" members will try to close the gap by halting the deterioration in either policy (a public good) or reputation (a collective good), while "inactive" members will do neither. In the present analysis, the demarcation between the active and inactive members is the most important determinant of organizational dynamics.

The second assumption to be abandoned is a basic seesaw pattern of voice and exit. Those who exit do not voice and vice versa. Thus, in order to improve organizational performance and prevent exit, it is essential to encourage members to exercise voice without exit. This assumption is not appropriate, however, for organizations that provide a public good. Former party members have both the opportunity and incentive to exercise voice as members of society who object to the declining quality of a public good (the party's stance on a policy). Exit need not be the final response to the organization; voice after exit may still be effective in changing its policies. If the option of voice after exit exists, then voice within the organization can be regarded as a predecessor to exit rather than an alternative to it. Hirschman (1970, 104) admits the exception that, in such situations, "the alternative is not so much between voice and exit as between voice from within and voice from without (after exit)," and instead of the seesaw pattern, exit and voice are both used by the same individuals.⁵ Voice within the organization is an important factor, especially if subsequent exit by those who exercise voice could have a significant effect and their threat to exit is credible. Even if change does not occur and they eventually exit, their exercise of voice helps recruit other members to exit with them, which puts more pressure on the organization. Voice within also augments the legitimacy of forming or participating in an alternative organization after exit. This calls into question Hirschman's view that loyalty is an intervening factor in the rational calculation of costs and benefits on which members base their exit or voice decision.

The Concept of Loyalty

Hirschman's idea about loyalty is meaningful as long as the trade-off between exit and voice is maintained, voice is regarded as a superior way to influence organizational performance, and voice is considered loyal behavior. Yet, the effectiveness of voice after exit and the variety of perceptions about organizational performance challenge this notion. We cannot equate loyalty with the strength of one's intention to stay (and

exercise voice) inside the organization, nor can we associate a specific response to organizational performance with loyal behavior.

I define *loyalty* as a willingness to act when one recognizes a problem with organizational performance. The greater one's loyalty, *ceteris paribus*, the greater the likelihood of taking action. Theoretically, the strength of one's willingness can be measured before a situation arises, that is, with no knowledge about individual or contextual specifics. In reality, however, the willingness to take an action cannot be separated from rational cost-benefit calculations and contextual conditions. Thus, in the empirical analysis presented here, the level of loyalty is treated as a black-box factor (see Appendix), but the concept is important in understanding certain organizational dynamics that are likely to increase member loyalty.

Effect of Organizational Activities

Several organizational conditions influence a member's choice of exit and voice: barriers to exit; proximity and availability of attractive alternatives; responsiveness of authority to voice; and the ease with which individuals can exercise voice (Hirschman 1970, 39–41, 79–82). According to Hirschman, these systematically affect loyalty among organizational members, but I do not assume that they are stable constraints: The members' own activities change these conditions more frequently and effectively in politics than in a market situation. For example, defectors from a certain organization often form a new one, that is, provide a viable alternative, rather than join an existing alternative. While this changes external conditions after exit, there are also factors that influence internal conditions. Organizational activities and their accompanying intense intraorganizational interactions encourage members to resort first to voice instead of exit. Unlike Hirschman's assumption that the promotion of voice in such cases is the means to prevent exit, some members use these strategic opportunities to persuade others to remedy organizational performance by resort to voice and then exit. These effects will be demonstrated in the empirical analysis of the SDPJ case.

The framework of exit, voice, and loyalty discussed here is summarized in Figure 1. Both organizational and individual factors are independent variables, but there is a distinction. Whereas individual factors figure exclusively in cost-benefit calculation, organizational factors may generally affect the level of member loyalty through contextual conditions. The dependent variables are the choice between voice or nonvoice and between exit or nonexit. Although loyalty is not independently operationalized in the quantitative analysis, it is assumed to affect each dependent variable via the organizational factors. The model of the quantitative analysis is presented in the Appendix.

THE LIBERAL DEMOCRATIC PARTY SPLIT IN 1993

When the LDP split in 1993, it single-handedly initiated a major change: the demise of a predominant

⁵ Recently, Hirschman has posited a variety of exit-voice relationships, especially one in which "enlarging the opportunity for exit can on occasion make for *more* rather than less participation and voice," based on the communist regime's collapse in the German Democratic Republic in 1989 (Hirschman 1993, 177). He convincingly shows that this mechanism led to the demise of the regime. The above point made by Hirschman is distinct from the discussion here, however. He looks at the concurrence of exit by self-interested citizens and voice by loyalists who stayed in the country; I emphasize that individuals who exercise voice are more likely to resort to exit.

party system. Aside from its importance for Japanese politics, this case is an interesting example of how intraparty dynamics can affect the party system.

From 1955 to the early 1990s, Japan was dominated by the conservative LDP (Pempel 1990, 4). It substantially controlled the cabinet and both houses of the Diet from 1955 to 1989. When the LDP failed to win a majority of seats in the House of Councilors in 1989, this proved to be a temporary setback, as its popularity was restored in the general elections the next year. The sudden breakup in 1993 was not due to the interfactional rivalry for which the LDP was famous but to defections across (not along) factional lines. The split also caused the LDP to lose its majority in the House of Representatives. Although the LDP had come under public criticism because of a newly disclosed political scandal, opinion polls did not indicate a decline in support.⁶ In other words, internal forces split the LDP, not a sharp drop in popularity or any real challenge from other parties.

Since the late 1970s, the LDP had institutionalized five factions as a system of command and control. Another division occurred in December 1992, when the largest of these, the Takeshita faction, split into two groups. The political influence of two previous faction leaders, Noboru Takeshita and Shin Kanemaru, had declined because of their implication in political scandals. Hostility among seven leaders in the next generation divided the Takeshita (formerly Tanaka) faction into two groups (Obuchi and Hata) almost equal in size in terms of House of Representatives members.⁷ The

breakup of the largest faction weakened the system of intraparty control.

The dispute between the Obuchi and Hata groups, which originated with a power struggle over management of the former Takeshita faction, became entwined with the issue of political reforms. Since the end of the 1980s, when a bribery scandal related to securities transactions of the Recruit Company was disclosed, the LDP cabinets (under Kaifu and then Miyazawa) had tried to reform the election system and political finance, but they had failed mainly because of opposition from within the party.⁸ When additional scandals were disclosed in the early 1990s, the public was critical of the incumbent LDP and demanded remedies. Opposition parties as well as many LDP members, especially those newer to the Diet, were eager to respond because they had fewer vested interests in the current system and were more sensitive to public criticism, since their electoral base was weaker than that of the more prominent LDP politicians. Many of these young members organized various groups across party lines to discuss and demand reforms.⁹

The Hata group, which had a weaker position than the Obuchi group in the Miyazawa cabinet,¹⁰ capitalized on the situation, stating that the reforms were necessary to prevent political corruption and criticizing the slow progress. The Obuchi faction took a more cautious position. In June 1993, when a reform proposal failed, the Hata group joined opposition parties in a no-confidence vote against the Miyazawa cabinet. Subsequently, the Hata group left the LDP and formed the Japan Renewal Party (JRP: Shinseitō). In addition, ten junior members from other LDP factions, also dissatisfied with the lack of political reforms, left to form another party, the Harbinger (Sakigake). Several other members also quit the LDP and remained unaffiliated or formed an independent legislative group.

Most of the defectors expressed dissatisfaction with the LDP by supporting the no-confidence motion (most of those who subsequently joined the JRP) or by being absent from the vote (most of those who subsequently joined the Harbinger). It is interesting that these two responses correspond to subsequent relationships with the LDP: the more hostile attitude of the JRP and the relatively compromising one of the Harbinger. Not only was voice exercised by most of those who eventually exited, but also the manner of expression continued to be reflected in their dealings with their former organization. The factors that influenced

⁶ LDP support declined when the consumption tax was introduced in 1989, but monthly opinion polls by the *Jijitsushinsha* showed a recovery in the early 1990s. Immediately before the breakup the LDP maintained a level of 30–35%, which was almost the same as the level from 1986 to 1988, when the party controlled both houses by a large margin.

⁷ The group headed by Keizo Obuchi and two other leaders extended its influence over former Takeshita faction members in both the House of Councilors and House of Representatives. The group headed by Tsutomu Hata and three other leaders claimed almost half the faction members in the House of Representatives.

⁸ The electoral reform was expected to institute a system of single-member election districts and/or proportional representation; the financial reform was expected to tighten public control over contributions to political parties.

⁹ Those familiar with Japanese politics may consider the membership of such groups an issue that should be addressed here, but it is not easy to determine the adherents. To avoid repercussions or to remain uncommitted, many junior members listed their names not only in these groups but also in the discussion groups organized by party leaders critical of reform.

¹⁰ The Hata influence was weaker because it had less presence in the House of Councilors and because Seiroku Kajiyama, of the Obuchi faction, had obtained the key position of LDP secretary general.

LDP members' decision to stay or quit (exit) and the way they expressed their discontent with the party leadership (voice) will be the first focus of the qualitative analysis.

After the breakup, the LDP retained a plurality in the Diet but lost its majority in the House of Representatives. In the general elections in July 1993, following House of Representatives dissolution after the no-confidence vote, the LDP kept almost the same number of seats but could not restore the majority lost by the defections. Five former opposition parties,¹¹ along with the two LDP splinters (JRP and Harbinger), formed the first non-LDP cabinet, headed by Morihiro Hosokawa, who had launched the New Japan Party about a year earlier. The formation of the first non-LDP coalition government since 1955 would not have happened at this juncture if the LDP had maintained its unity.

Meanwhile, Japanese politics continued to revolve around the issue of political reform, especially changes in the general election system. The LDP experienced further exits as well as expressions of noncompliance with the party leadership until January 1994, when the Diet passed bills dealing with political reform. Exit and voice of newly elected or reelected LDP members during this period after the LDP lost dominance (August 1993 to January 1994) will be analyzed below.

In summary, the LDP was perceived to have deteriorated by certain members. They believed the party had become paralyzed by political corruption and collusion with special interest groups, and they advocated political reform. Although those who exercised voice supported strong reforms, others denied the need altogether or advocated very moderate change. The members most likely to resort to voice and exit were those most concerned about declining party reputation (a collective good), due to the LDP's failure to implement political reforms (a public good) demanded by the public.¹²

Data Sets and Variables

The quantitative analysis is based on two data sets. The first consists of behavioral, personal, and organizational characteristics of LDP House of Representatives members in June 1993. The second was obtained from the party's House of Representatives members in January 1994, immediately after passage of political reforms.¹³

¹¹ The Social Democratic Party of Japan (SDPJ), Clean Government Party (CGP), Democratic Socialist Party (DSP), Federation of Democratic Socialists (FDP), and New Japan Party (NJP).

¹² Some may question whether all defectors, especially the experienced members of the former Takeshita faction, were idealistically motivated. The key point is that political reforms were at least consistent with their interests, even if some defectors used the issue to better their own political position by currying support from voters.

¹³ For consistency, the 1993 data set includes House of Representatives members who were elected in 1990 as LDP candidates and remained party members until the no-confidence vote in June 1993, and the 1994 set includes those who were elected in 1993 as LDP candidates. There is much overlap between the two periods, but a

Dependent Variables. An LDP member's choices about whether to exit and whether to exercise voice are the dependent variables. In the 1993 group, these are labeled, *Voice93* and *Exit93*, which represent members' voice/nonvoice and exit/nonexit, respectively. The probit model gives the value of 1 or 0 (dummy variable) to such binary data. Specific scoring rules for the dependent variables are as follows.

Voice93 = 1 when a member of the LDP was either absent from the no-confidence vote on the LDP cabinet or voted for the no-confidence motion (noncompliance with the party).¹⁴

Voice93 = 0 when a member of the LDP voted against the no-confidence motion (compliance with the party).

Exit93 = 1 when a member quit the party after passage of the motion in June 1993 (exit).

Exit93 = 0 when a member stayed in the party after June 1993 (nonexit).

In the 1994 groups, the two dependent variables are *Voice94* and *Exit94*, which represent the following values and behavior.

Voice94 = 1 when a member of the LDP showed noncompliance with the party from August 1993 to January 1994.¹⁵

Voice94 = 0 when a member complied with the LDP during that time.

Exit94 = 1 when a member of the LDP quit the party between August 1993 and January 1994.

Exit94 = 0 when a member stayed in the party during that time.

Independent Variables. There are nine independent variables. Seven are individual factors that refer to personal characteristics of LDP members or their districts. Two are organizational factors.

Among the individual factors is *Terms*, which expresses the number of legislative terms served. Senior members have more vested interest in the party and are more likely to resist change, whereas junior members of the party are more apt to use voice and exit to bring about changes. The expected sign of the coefficient of terms for both dependent variables (voice and exit) is negative. *Urbanization* shows the extent of urbanization in a member's election district.¹⁶ A less organized

substantial number quit the party, and new members were elected in the general elections held during the interval.

¹⁴ No distinction is made in the analysis between absentees and noncompliers. It is true that a no-confidence vote expressed stronger criticism of the party than did absence, but a division into these two categories would yield so few observations that the probit analysis could be distorted. I apply the same rule to the categorization of the other dependent variables.

¹⁵ Noncompliance (*Voice94* = 1) is defined as a member who (1) was absent from the prime minister's election without supporting the LDP candidate in August 1993; (2) left a faction; (3) was absent or voted for the non-LDP government's political reform bill in November 1993; or (4) was absent or voted against the political reform bill proposed by the LDP in November 1993.

¹⁶ The categorization is based on the index provided by a Japanese newspaper (*Asahi Shimbun*), which measures "population concentration" by the percentage (*P*) of the electorate living in residential, industrial, and commercial areas in each election district. According to *P*, 130 election districts are divided into four categories. (1) If $P \geq$

urban electorate is expected to base its voting on a politicized issue, such as political reform. Thus, LDP members from urban districts are likely to be more sensitive to the electorate's concerns. The expected sign of the coefficient is positive. *Electoral Strength* indicates how easily the LDP member won in the most recent election.¹⁷ Because a stronger candidate is expected to be less dependent upon the party in elections, and thus less compliant, the expected sign of the coefficient is positive. *Assets* measures the personal property of a member.¹⁸ The expected sign of the coefficient is positive, since a member with substantial wealth is more likely to resist the party.

Three dummy variables are included among the individual factors. *Relatives* takes the value of 1 for a member with family relations currently or previously in the Diet, 0 otherwise. The expected sign of the coefficient is negative, since family connections to the LDP are likely to increase a member's commitment to the party. *Local Politics* is a dummy variable that takes the value of 1 when a member is a former local politician, 0 otherwise. The expected sign of the coefficient is positive, since a local career implies strong support in one's election district and hence less dependence on the party. *Bureaucrats* is a dummy variable that takes the value of 1 when a member is a former bureaucrat, 0 otherwise. The expected sign of the coefficient is negative, because the propensity to support the party's rule should be relatively stronger among those who worked in LDP governments prior to becoming politicians.

There are two organizational factors. *Faction Size* refers to the number of people in the Diet who belong to a member's faction.¹⁹ Members of a large faction are more likely to criticize or quit the party. Indeed, the split in the Takeshita faction triggered voice and exit through the LDP. Thus, the expected sign of the coefficient is positive. *Nonfaction Dummy* takes the value of 1 when a member does not belong to a faction, 0 otherwise.

85, then the category is big city. Thirty-five districts with 145 seats fall in this category, and the urbanization index score is 4. (2) If $P \geq 65$, then the category is city. Thirty-seven districts with 148 seats fall in this category, and the urbanization score is 3. (3) If $P \geq 50$, then the category is local city. Forty-three districts with 175 seats fall in this category, and the urbanization score is 2. (4) If $P < 50$, then the category is noncity. Fifteen election districts with 44 seats fall in this category and are scored 1.

¹⁷ This index is obtained when the votes received by the winner are divided by the votes of the candidate who finished first among the losers.

¹⁸ The data are published occasionally by the Ministry of Internal Affairs (especially for new members after a general election). The unit is ¥10 million (= \$100,000; assuming \$1 = ¥100 in 1993 and 1994).

¹⁹ Diet membership in 1993 and in 1994 was used to create the index for each data set. The following numbers give the 1993 figure first, then the 1994 figure: Takeshita faction (66, 31), Miyazawa faction (60, 55), Mitsuzuka faction (58, 56), Watanabe faction (45, 52), and Komoto faction (24, 21).

Analysis of LDP Case Results

Results of the probit analysis of exit and voice among LDP members in 1993 and voice in 1994 are summarized in Table 1.

Exit and Voice in 1993. In Table 1, equation 1 involves all LDP members in 1993. The result shows that two variables, terms and faction size, are the two most important determinants of behavior. It is possible that the Takeshita faction, because of its size, swamps the all-LDP data. That is, the causes of exit and voice in the Takeshita faction, by their dominance, may conceal the influence of other factors on the behavior of other LDP members. Thus, all LDP members and the Takeshita faction will be analyzed separately.

There is a clear contrast between exit and voice within the Takeshita faction (equation 2) and among other party members (equations 3 and 4). The dependent variable of equation 2 can be defined either as voice and exit (because the Hata group of the Takeshita faction either voted for the no-confidence motion or was absent and then subsequently quit the party) or as neither voice nor exit (by all other Takeshita faction members). Among the remaining LDP members, there was no such clear demarcation, and thus exit and voice are regarded as distinct dependent variables in equations 3 and 4. The coefficient of terms has a negative sign and is statistically significant in equations 2 and 4. This concurs with the observation that the LDP split in 1993 was caused by newer legislators (one or two terms). The coefficient of local politics has a positive sign and is statistically significant in equations 3 and 4. Although urbanization is statistically significant in all these equations, its sign is positive in equation 2 and negative in equations 3 and 4.

Let me first interpret the coefficient of urbanization. Close examination of the individual data reveals that many in the Takeshita faction who were serving their first or second term at this point were elected from nonrural areas. Certainly, junior members from urban districts were overrepresented.²⁰ Because almost all the junior members in the faction joined the Hata group and then the JRP, the positive and statistically significant sign for urbanization in equation 2 is likely to be influenced by this coincidence.²¹ The negative signs in equations 3 and 4 require more speculation. At the time of the LDP split, the election system and political finance reforms began to be politicized, but the members could not judge whether public sentiment for reforms was sufficient to affect electoral support. It is possible that members from rural districts, where electoral support is generally more stable and organized than in urban areas, felt they could take the risk of supporting reforms.

If exit and voice by nonmembers of the Takeshita

²⁰ Almost 70% of one- or two-term members in the Takeshita faction were elected from big-city or city election districts. Among the entire faction, about half came from nonrural districts.

²¹ Junior members representing predominantly urban interests may have formed a group, which could have reinforced their support for political reform, but there is no empirical evidence of this.

faction are regarded as risk-taking behaviors, then the positive signs for local politics in equations 3 and 4 can be interpreted in the same way as urbanization. That is, a strong local base makes a member less dependent on the party and potentially less compliant. The same reasoning may explain the unexpected positive sign for relatives in equation 4. Family connections in the political world, rather than reinforcing compliance with the party, apparently contribute to independence by providing "inherited" electoral support and political resources.

The negative and statistically significant coefficient for faction size in equation 4 also merits attention. When the Takeshita faction is excluded, members of other relatively large factions are revealed to be more important. This refutes the contention in the previous section that larger factions have difficulty imposing party discipline, but more detailed examination is

necessary before reaching this conclusion. The negative sign in equation 4 contrasts sharply with the positive sign in equation 1. If the Takeshita faction is included, the coefficient has the expected sign (equation 1). This result can be explained by considering the relative size of each faction and the voice incentives unrelated to faction size.

In 1993, the Takeshita faction was the largest in the LDP, followed by three of medium size (Mitsuzuka, Miyazawa, and Watanabe), and then the small Komoto faction. Setting aside the Takeshita faction, if faction size decreases compliance, then members of Komoto would be much less likely to exercise voice and/or exit than members of the other three, which were about double in size. Yet, among twenty-four Komoto members, seven were absent from the no-confidence vote (voice), and two quit the party (exit). This high proportion of noncompliance in the smallest faction is

consistent with the unexpected sign for faction size in equation 4. The behavior is attributed to a general sentiment for reforms within the group, which was inherited from the former faction head, the late Takeo Miki, who had advocated the necessity for remedies for political corruption and led political finance reforms in the 1970s. Thus, the current Komoto leaders, who had been influenced by Miki, were more lenient toward members who exercised voice and exit. Five of the absentees remained in the party without punishment, and two joined the Harbinger. These characteristics of the Komoto faction also may explain the statistically significant negative sign for faction size in equation 5.²²

Equations 5 and 6 enable comparison of voice between newer and more senior LDP (non-Takeshita faction) members.²³ The terms variable has a statistically significant and negative coefficient in equation 5 but does not appear to be a meaningful determinant in equation 6. This implies that length of service was not a special influence on voice among senior members, whereas it was a factor among newer members. In other words, those with longer service tended to toe the line, while relative newcomers were less disciplined. The urbanization coefficient is statistically significant only in equation 5, and the coefficient for relatives is significant only in equation 6. This indicates that the effect of these factors in equation 4 is derived from different subgroups of the entire sample. Generally speaking, it is difficult to characterize those who exercised voice among the members with more than three terms.

Comparison of Voice in 1993 and 1994. Equation 7 in Table 1 concerns voice among LDP members in 1994.²⁴ Whereas the effect of terms remains the same as in 1993,²⁵ the coefficient of urbanization becomes positive, and the positive coefficient of electoral strength becomes statistically significant. Both changes can be interpreted as follows. Intensive politicization of the reform issue encouraged members from urban districts to resist the party and impress voters with their eagerness for reform; urban constituencies were less partisan and had keener interest in the issue than did rural voters. Members also became more conscious of their electoral strength. The institution of small districts and proportional representation was anticipated, so members who had been weak in previous elections were less likely to defy the party. They would have to compete with colleagues for party nominations in small districts and/or for a priority spot on a party list in proportional

representation. Both the assets and bureaucrats variables are statistically insignificant in all models. Although the neutral influence of the latter can be taken at face value, it is possible that the voluntary disclosure of assets by legislators may not be completely reliable; thus, assets continues to be statistically insignificant because of poor measurement of the variables.

In terms of the distinction between individual and organization factors and their relationship to exit and voice, the results of the quantitative analysis suggest the following. Although an organizational factor such as faction size has a limited influence, various individual factors consistently explain members' behavior. An important finding concerns the strategic use of voice. In the case of the Takeshita faction in 1993, those who used voice all subsequently exited to join the JRP (hence the dependent variable is written either as voice or exit in equation 2). Similar use of voice also occurred among the LDP members who joined the Harbinger, although instead of voting for the no-confidence motion they were absent from the voting. Both these acts defied the LDP executive and thus can be regarded as the exercise of voice, but their strategic effects were different. Whereas a no-confidence vote was a decisive step toward leaving the LDP, absence expressed resistance to the executive but left room for compromise in the future. This contrast in behavior corresponds to the different approaches of the two splinter parties formed by the defectors. The JRP, whose members had voted for the motion, continued its confrontation with the LDP for several years, whereas the Harbinger, whose members were absent from the vote, allied with the LDP after about a year.

The LDP returned to office in June 1994 by forming a coalition with the SDPJ and Harbinger. This caused a change in LDP members' behavior and requires a different analytical model from the one presented here.

DISCORD AMONG THE SOCIALISTS: 1994 TO 1995

A good case for comparison with the LDP split in 1993 is the discord within the SDPJ from 1994 to 1995. The friction was exacerbated after the coalition with the LDP in 1994, but it failed to develop into the split that had been expected before the House of Councilors elections in July 1995. To understand why discord intensified within the SDPJ, one needs to examine the last three months of the Hosokawa cabinet, the point at which the empirical analysis of the LDP ended in the previous section.

The first non-LDP coalition government, headed by Hosokawa, implemented reforms of the election system and political finance at the beginning of 1994. Immediately afterward, the issue of tax reform emerged. The prime minister, who had strengthened his connection with coalition parties, the JRP and the Clean Government Party (CGP), abruptly proposed the people's welfare tax (*kokumin fukushizei*), which would increase the rate of the existing consumption tax. The proposal caused friction among the coalition parties. The SDPJ and Harbinger especially opposed

²² It is possible that the Komoto leaders even welcomed insubordination to facilitate political reforms, although they did not desire the LDP breakup. To avoid distortions caused by too many dummy variables, it was not possible to operationalize this kind of faction characteristic in the quantitative analysis.

²³ The probit analysis of the exits of each group does not produce meaningful results (perhaps because of the relatively small number of exits in the sample), and those results are not presented here.

²⁴ At this point, several members quit the party, but the probit analysis of exit does not produce a meaningful result (perhaps because of the relatively small number of defectors in the sample), so only voice is analyzed here.

²⁵ The members who were in their first or second term in the 1993 data set were in their second or third term in the 1994 data set.

the idea, not only because they were cautious about the tax increase but also because Hosokawa had failed to consult the leaders of the two parties about his proposal.

Although the plan was immediately withdrawn because of public opposition, the antagonism within the coalition government remained. When the SDPJ and Harbinger walked out, the remaining parties had to form a minority government, in May 1994, headed by Tsutomu Hata. At the end of June, the Hata cabinet resigned, and all the parties sought coalition partners with whom to form a government. The result was an alliance of the LDP and SDPJ, with Harbinger as broker. Aside from Harbinger's effort, contributing factors were the LDP's political entrepreneurship and deep distrust by the SDPJ's left wing of the other non-LDP coalition parties, especially the JRP and the CGP. The left-wing Social Democrats also opposed the party's right wing, which was eager to modify its leftist positions and strengthen the non-LDP coalition. After the SDPJ dropped out of the Hosokawa government, the LDP capitalized on this disharmony. It attempted to win over the SDPJ's left wing by offering the position of prime minister to its leader, Tomi'ichi Murayama. This left-wing "pragmatist" became head of the LDP-SDPJ-Harbinger coalition government.²⁶

Phase 1: September–November 1994

The arrangement of the Murayama cabinet was destined to intensify conflict within the SDPJ. Soon after cabinet formation in July 1994, it became apparent that the Socialists had divided into two camps. At the end of August 1994, the Democrats, a right-wing group of the SDPJ, recruited additional members from the center and right and formed the New Democratic League (NDL: Shinminren), which claimed more than 60 Diet members. It sought to resume the alliance with the DSP, the JNP, and other liberal groups outside the party. Among the other SDPJ Diet members, more than 50 active members of the left-to-center wing formed a loose group, termed here the Murayama Support Group (MSG).

At the SDPJ annual meeting held on September 3, 1994, the party formally decided on major shifts in policy orientation: the constitutionality of keeping a self-defense force and the official status of a national song and a national flag, both of which dated back to imperial Japan. The resulting conflict became more complicated because neither group fully welcomed the change. The center-to-right wing wanted a reversal of leftist policies but not the LDP alliance, preferring instead a coalition with the non-LDP parties and formation of a new liberal party. In contrast, the center-to-left wing reluctantly agreed to the shift in order to secure the top post for their leader and to help the party survive by securing governing power through alliance with the LDP. More important, the SDPJ at the local level opposed the national party's unexpected

coalition and the policy reversals. In this sense, there was a large gap in perception between the national and local levels. At the national level, the members supported either the Murayama cabinet or the policy changes, whereas those at the local level opposed both.²⁷

After the September meeting, the NDL faction began to argue for disbanding the SDPJ in January 1995 and creating a new party. This not only would end the Murayama cabinet but also would make the left wing a small remnant party. Meanwhile, the national umbrella organization of labor unions, Rengo, became involved. It had exercised significant influence in formation of the non-LDP coalition and subsequent Hosokawa cabinet in 1993, which had changed the image of labor as a weak force in Japanese politics. But now the unions were divided into those who favored a new party and those who did not.²⁸

On November 26, the NDL held a symposium to express its resolution to form a new party and invited several members of Harbinger, some liberals in the Diet, and union supporters. Thirty-seven SDPJ members in the House of Representatives publicly supported this symposium and were regarded as NDL core members. To examine what factors divided them from the other Socialists, a quantitative analysis of the SDPJ was conducted, which will be described later.

Phase 2: November 1994–January 1995

The NDL symposium was not a great success. Deep skepticism about the NDL's resoluteness encouraged the group members to compromise with others in the SDPJ and agree to shelve the proposal. Yet, many Socialists, including non-NDL members, admitted the need to revitalize the party in the face of declining popular support. Thus, Prime Minister Murayama and others in the party accepted the NDL's suggestion of a provisional meeting in January 1995, on the condition that it would not lead to an immediate dissolution and formation of a new party. After the November symposium, the prime minister and SDPJ secretary-general Kubo made this agreement, which marked a compromise between the two camps.²⁹ It was certainly facilitated by a desire to maintain the SDPJ's position in the coalition government; both the LDP and Harbinger were concerned about their ally's internal dispute and the inflexibility of its traditional policy position.

²⁷ At the meeting, another conflict emerged over two important party posts. Both camps called for votes to determine the deputy chair and the chair of the Party Diet Management Committee, both of which were usually determined by negotiation. The right wing won both by a small margin.

²⁸ For example, the NDL was supported by four major unions: the Japan Postal Workers' Union (Zentei), the Japanese Federation of Iron and Steel Workers' Unions (Tekkororen), the Federation of Telecommunications (Zendentsu), and the Japanese Federation of Electrical Machinists Unions (Denkirengo). The All Japan Prefectural and Municipal Workers' Union (Jichiro), who had a strong tie to the prime minister, sided with the Murayama Support Group.

²⁹ Because the SDPJ secretary-general, Wataru Kubo, had a close relationship with the NDL, he negotiated with Prime Minister Murayama, who was also a party chair.

²⁶ Austen-Smith and Banks (1988) provide a formal case in which two extreme parties may form a coalition government.

The compromise did not last long. When party executives decided on December 22 to postpone the provisional meeting from January to February, the radicals in the NDL regarded this as breaking a promise. On January 17, 1995, seventeen NDL members of the House of Representatives and seven from the House of Councilors, headed by Sadao Yamabana, gave notice to the SDPJ that they would form a new legislative group in the Diet and subsequently secede from the party. To examine the factors that distinguish this group from the other SDPJ members in January 1995, a quantitative analysis will compare data at this time with data on the NDL symposium in the previous November.

Phase 3: The Demise of the New-Party Movement

January 17, 1995, was also the day on which Japan was hit by the largest earthquake of the postwar era. The secession of the NDL radicals was postponed so that the coalition government could concentrate on disaster relief. At the beginning of March, the defectors resumed plans, and Yamabana decided the group would secede in April, but there was an unexpected shock when the labor unions began to withdraw their support.³⁰ In May 1995, Yamabana, four colleagues of the House of Representatives, and two from the House of Councilors tried to secede from the SDPJ, but party executives accepted only their succession from a legislative group of the party in the Diet. The SDPJ neither experienced a major split nor became a new party before the elections of the House of Councilors in July 1995. The analysis ends here, although internal discord continued, and the final breakup of the SDPJ in 1996 may be regarded as an extension of voice originally activated by the NDL. Nevertheless, the formation of the Democratic Party, which triggered the breakup, was initiated from outside the SDPJ, as will be explained in the concluding section.

Before presenting the quantitative analysis, I will briefly interpret the NDL members' attempt to recreate the SDPJ. The group members wanted a new liberal party (i.e., a public good) that would include SDPJ members as well as members of other parties. They viewed this as serving the long-term interests of the SDPJ, whose popularity was declining. The NDL members actively used voice to win other Socialists to the idea. Nevertheless, when the NDL members demanded the immediate formation of a new party, they were viewed as a threat to party unity, which would further weaken the Socialists' position.

³⁰ Zentei first revoked its support for Yamabana's new party. Because the rank-and-file in Japanese labor unions is not well organized, decision making is dominated by the leadership, especially regarding politics. But the delay in forming a new party allowed time for pressure from below to persuade leaders to withdraw backing.

THE DATA AND VARIABLES FOR THE SDPJ CASE

The two quantitative analyses of the SDPJ will use the same data set, the Socialist House of Representatives members from November 1994 to January 1995.

Dependent Variables

The SDPJ members' decisions to use voice are the dependent variables. The NDL's attempt to change the SDPJ and form a new party is defined as an exercise of voice that failed to develop into exit. The two dependent variables are *Voice94* and *Voice95*, each of which refers to voice/nonvoice. The probit model gives the value of 1 or 0 (dummy variable) to such binary data. The values of the dependent variables are as follows.

Voice94 = 1 when the name of the SDPJ member appears on the list of coorganizers of the NDL symposium in November 1994, otherwise 0.³¹

Voice95 = 1 when a member of the SDPJ had intended to secede from the party in January 1995, otherwise 0.

Independent Variables

Among the six independent variables, three are individual factors and three are organizational factors. Several variables differ from the LDP case because the same ones are not relevant. For example, very few SDPJ members were former bureaucrats. The most important difference was terms, since the SDPJ's conflict was not intergenerational.

Among individual factors, *Conflicting Electoral Interest* is a dummy variable indicating a possible election contest between an SDPJ member and a member of the LDP or Harbinger. Specifically, if the SDPJ member wanted to be a candidate in a single-member election district in which a coalition member(s) also wanted to be elected, the value of 1 is assigned, 0 otherwise.³² The expected coefficient sign is positive; a member in a potential conflict with the coalition parties would be more likely to resist Murayama's leadership and to demand a new party. *Electoral Strength* is the same measure as in the LDP analysis, which indicates how easily a member won in the most recent election. The expected sign of the coefficient is positive, since a stronger candidate is expected to behave more independently of the party. *Assets* measures the personal assets of each member as explained in the LDP analysis. The expected coefficient sign is positive, because members with strong financial resources are less dependent on the party.

As for organizational factors, *Local Politics* is a

³¹ I do not distinguish between those who attended the symposium and those who listed their name but were absent, since the aim is to identify the signatories.

³² Since incumbents all wanted to run in new single-member election districts that overlapped as much as possible with their electoral base in the older medium-sized districts, there were many conflicts among them over the party nominations. The data are from *Asahi Shimbun*, January 1995.

dummy variable that takes the value of 1 when a member is a former local politician; 0 otherwise. The concept differs from the LDP case, in which this variable represented a local base of electoral support that could foster independence from the party (the expected coefficient sign was positive). In the SDPJ case, the variable expresses the extent to which a Diet member is sensitive to local interests. Given the local-national difference in attitudes among SDPJ adherents regarding a new party, Diet members who were former local politicians are expected to be more sensitive to opposition in their district to the new-party movement. Since Voice94 indicates support for the NDL's efforts in this direction, the expected coefficient sign is negative. *Labor Support* is a dummy variable that takes the value of 1 when a member had the support of labor unions that favored the formation of a new party, 0 otherwise. The expected coefficient sign is positive. Finally, *Aichi-Hyogo* is a dummy variable that takes the value of 1 if a member came from an election district in Aichi or Hyogo prefectures, 0 otherwise. Because two prominent NDL leaders from these prefectures supported the new-party movement, their personal influence would most likely encourage Diet members from these areas to do the same. Thus, the expected sign of the coefficient is positive.

RESULTS AND INTERPRETATION OF THE SDPJ CASE

The results of the probit analysis of voice among SDPJ members in 1994 and 1995 are summarized in Table 2.

Factors That Led to Exercise of Voice

Table 2 presents the results of two different probit regressions. Equation 1 relates to the NDL symposium in 1994. The results show that three variables—local politics, labor support, and Aichi-Hyogo—were statistically significant determinants in the decision to list one's name among coorganizers of the symposium. It is interesting that individual factors had little influence, and there are two plausible reasons. First, since the final decision had been made for the reform of the general election system, that was not a major political issue during the period analyzed, in sharp contrast to the LDP case. Second, and more important, because the elections under the new system had not yet been scheduled, there was great uncertainty for SDPJ members about which decision would increase their electoral advantage.

Local politics has the expected negative coefficient and is statistically significant. This shows that the antipathy of local branches toward the new-party movement was reflected in the behavior of the SDPJ members who were former local politicians. Coefficients of the other organizational factors, labor support and Aichi-Hyogo, are positive and statistically significant. This indicates that strong ties with the labor unions that favored the new party and the influence of NDL leaders in specific prefectures were important for predicting members' behavior.

The results of the analysis for January 1995, when seventeen NDL members were about to quit, differ in one important respect from November 1994 results. Although labor support and Aichi-Hyogo have positive signs and are statistically significant, local politics has a negative sign but is no longer statistically significant. Thus, only two organizational factors influenced the behavior of members in 1995.

A Time Bomb That Never Exploded

Although the LDP case exemplifies the effectiveness of voice when closely tied with the threat of exit, the SDPJ case illustrates that the threat of exit can lose credibility. Did the great earthquake affect the outcome? The results of the quantitative analyses suggest not; the members' motivations to exercise voice in 1994 differed from those in 1995. When the NDL started its activities, there appeared to be a clear distinction in the vision of the party between those who exercised voice and others. Yet, as the description of the process has shown, their difference of opinion came to be centered on a tactical matter—when and how the SDPJ would metamorphose. This shift is explained by an increasing desire inside the SDPJ, especially among local branches, to renew the party. The national-local cleavage embedded in the conflict at the beginning had disappeared during the process. More local branches came to support party renewal after the NDL sym-

posium³³ The change in their attitude corresponds to the results of the quantitative analysis showing statistical significance for local politics in 1994 but not in 1995.

Ironically, the voice demanding a new party lost its legitimacy as the idea of party renewal came to be accepted. The distinction remained between those who demanded the immediate formation of a new party and those who saw it as a more remote possibility. The ties to specific labor unions and to the new prefectures from which the strong NDL leaders came were the factors that distinguished the radical NDL members from other faction members as well as from other Socialists. NDL members without strong ties to unions and/or prefectures did not try to quit the SDPJ in January 1995. Because of the quake, the radical NDL members could not leave the party on the day they had planned. Three months later, waning union support ensured the demise of the new-party movement.

This SDPJ case result also has an interesting implication for the distinction between individual and organizational factors. The latter contribute to the activation of voice, but they do not guarantee that it will occur. In the case of the SDPJ, voice neither reformed the organization nor evolved into exit. Those who had exercised voice failed to redefine their goal in such a way that the formation of a new party came about. This process contrasts clearly with the LDP case, in which individual factors were more important in the activation of voice and exit.

CONCLUSION

The analysis of the two Japanese cases shows that exit and voice by party members can be predicted by personal characteristics and organizational conditions. I conclude by comparing the two cases and examining the implications, which confirm the central argument of this article, that is, the successive activation of exit and voice by the same individuals. Both the LDP and the SDPJ experienced intense internal discord almost simultaneously, but the consequences were quite different. The LDP broke up at an early stage, whereas the unity of the SDPJ continued until 1996, despite two major electoral defeats (the House of Representatives election in 1993 and the House of Councilors election in 1995) and a decline of support in public opinion polls. What factors explain the different consequences, and what implications can be drawn?

First, we need to pay attention to the public good, the goal of those who exercised voice in both cases. In the LDP case, electoral and political finance reforms were considered public goods by those dissatisfied with

the party. Their aim was clear—change the election and political finance systems—and the LDP members were divided into supporters and opponents of such reforms. These two groups had distinct personal characteristics. In comparison, the definition of the public good was not very clear in the SDPJ case. At the beginning, the issue appeared to be whether a new party should be formed to revitalize the party. Later, when everyone recognized the need to revitalize, the issue shifted to what kind of action at what specific time was appropriate to achieve party renewal.

Second, although the factors that reflect individual electoral conditions (political career and economic and political resources) were dominant influences on the choice of LDP members, organizational factors appeared more influential in decisions of the SDPJ members. In the LDP case, faction affiliation (including faction size) had a limited effect. But in the SDPJ case, strong ties with specific intraparty organizations or outside supporters were critical determinants of behavior. Organizational factors may strongly constrain member behavior, but at the same time their influence may be modified by contextual changes. Interaction between organizational factors and contextual changes are important in understanding why the activation of voice failed to develop into exit in the SDPJ case in 1995.

The final breakup of the SDPJ in 1996 is consistent with the arguments presented here, though it took place after the period of analysis. The LDP-SDPJ-Harbinger coalition formed a new cabinet, headed by Ryutaro Hashimoto of the LDP, at the beginning of 1996. SDPJ executives sought to merge with Harbinger and potential defectors from the New Frontier Party (which was formed by non-LDP coalition parties) into a unified center-left party, while the NDL initiative waned. In September 1996, when it was certain that general elections under the new system would take place the following month, Yukio Hatoyama of Harbinger and Kunio Hatoyama of the New Frontier Party (brothers from a well-established political family) decided to form a new center-liberal party but refused to accept the entire SDPJ. At this point, the SDPJ split into a rump group that retained the name and a group that joined with the new Democratic Party. Sixteen former SDPJ members joined the new party, all except three of whom were former NDL members. All the House of Representative members who had been involved in the NDL movement eventually quit the SDPJ and competed in general elections under the flag of the Democratic Party. The labor unions supported that party and kept their distance from the SDPJ.³⁴

The SDPJ case reveals two different relationships between the behavior of party members and labor unions that give electoral support to the members. In 1994–95, legislators committed to the new-party movement because labor unions supported it; in 1996, labor unions supported the new Democratic Party because

³³ There is evidence that local branches increasingly perceived the need for a new party. For example, in inquiries conducted between November 26 and 30 by *Asahi Shimbun*, many local branches of the SDPJ expressed a cautious attitude about the formation of a new party. Among 47 surveyed, 17 opposed the idea, and 25 supported it. A few weeks later, at a meeting of local representatives of the SDPJ on December 18, 33 branches favored it, and only 3 explicitly opposed it (*Asahi Shimbun*, December 19, 1994).

³⁴ The local branches of the SDPJ were divided into a group supporting the SDPJ candidates and one supporting the DP candidates.

the legislators with whom they had strong ties had already moved to that party. This difference implies that the formation of the new party by politicians outside the SDPJ shifted the relative strength of influence from the labor unions to the SDPJ members, and ultimately contributed to the breakup of the SDPJ in 1996. In this sense, the formation of the Democratic Party may be regarded not only as an attractive alternative for potential SDPJ defectors but also as a factor that changed an important organizational element, the leverage of the labor unions over the legislative members. This change caused by the formation of the Democratic Party demonstrates that organizational dynamics cannot be reduced to the rational calculation of costs and benefits expected from personal characteristics. The constraints on individual members may be different if the context changes. More specifically, the same organizational connection (such as the tie with the labor unions) may have a different effect on individual behavior if the context alters (such as formation of the Democratic Party).

The breakup of the SDPJ also is interesting in terms of individual factors. Eventually, 27 former SDPJ members sought reelection as members of the Democratic Party in the October 1996 elections, that is, about a month after the formation of the party. Only five were reelected, an even worse showing than that of their former colleagues who remained in the SDPJ. This is indirect but convincing evidence that many SDPJ members' decisions to affiliate with the new party were not motivated by short-term electoral interests.³⁵ Just as in 1994–95, individual factors did not determine members' participation in the new-party movement in 1996.

Finally, the activation of voice and exit by the same individuals is confirmed in the case of the SDPJ. Because many defectors came from the NDL faction, the breakup of the SDPJ was regarded as an outgrowth of the new-party movement. The latent potential for a party split was there, triggered from outside the party. Although the use of voice was immediately followed by exit in the LDP case, there was some time lag in the SDPJ case.

Empirical evidence from Japan points to the successive activation of exit and voice by the same individuals in a political organization, which is contradictory to Hirschman's model. The members whose threat of exit is credible are also able to exercise voice effectively, but whether they resort first to exit (without voice) or first to voice within (and then possibly outside) the organization is influenced by contextual conditions. In conclusion, the modified framework of exit, voice, and loyalty provides a perspective for looking beyond the party as a unitary actor and for analyzing the effect of intraparty politics on the party system.

³⁵ For example, an important member of the NDL, Kanju Sato, quit the SDPJ, ran for reelection under the Democratic Party, and lost. He might have been reelected if he had remained in the SDPJ (his name had been at the top of the SDPJ list in a proportional representation district, and the SDPJ won a seat there). Others who moved to the Democratic Party and lost may have had dim prospects for reelection anyway.

APPENDIX: THE MODEL

According to the revised framework presented in this article, party members' rational calculation of costs and benefits and their loyalty determine whether they exit or exercise voice. The cost-benefit calculation is influenced by the acquired characteristics of individual politicians, such as political career and economic background, whereas loyalty is a personality trait. This means that one weighs cost and benefits of voice by considering one's electoral strength, financial standing, reputation, and so on, while personal inclination influences whether one is loyal to an organization. Consider Y_i^* as an index of propensity to voice. Y_i^* is determined by characteristics of the i th member, that is, by her rational calculation of costs and benefits by her loyalty. In this context, nonvoice is regarded as loyalist behavior. If the latent (unobservable) variable Y_i^* determines the behavior of the i th individual (i.e., to voice or not to voice), then the above relationship is summarized as follows:

$$\text{Voice} = Y_i^* > 0;$$

$$\text{Nonvoice} = Y_i^* \leq 0.$$

We approximate Y_i^* by a linear function of personal characteristics of the i th individual. Among such characteristics, the level of a certain individual's loyalty to the organization is assumed to be innately determined (or acquired independently from one's political background) and to work against the exercise of voice. If the k th characteristic of the i th individual is expressed as X_{ki} ($k = 1, \dots, K$), the above equation is rewritten as follows:

$$Y_i^* = \sum b_k X_{ki} + b_0 + e_i.$$

Thus Y_i^* is a function of personal characteristics of the i th individual, though Y_i^* cannot be observed. Consider the variable Y_i , which takes the value 1 or 0 according to the behavior of the i th individual, voice or nonvoice. Y is determined by the sign of Y^* as follows:

$$Y_i = 1 \quad \text{if } Y_i^* = \sum b_k X_{ki} + b_0 + e_i > 0;$$

$$Y_i = 0 \quad \text{if } Y_i^* = \sum b_k X_{ki} + b_0 + e_i \leq 0.$$

The model ultimately aims to find a probability that Y_i equals 1 (i.e., a probability that i exercises voice). From the above, when $\sum b_k X_{ki} + b_0 > -e_i$, $Y_i = 1$. Therefore, $P(Y_i = 1 | X_{ki}, k = 1, \dots, K) = F(\sum b_k X_{ki} + b_0)$, where F is a cumulative distribution function of e_i . $P(Y_i = 1)$ is a function of the linear term, $\sum b_k X_{ki}$.

Because a binary choice between exit or nonexit within the organization is analyzed by the same model as the choice between voice or nonvoice here, only the model for the voice analysis is explained. For the quantitative analysis of the members' exit (from the party) and voice (to express dissatisfaction with the party) based on the above formulation, the article employs a probit model that is suitable for the analysis of qualitative data that includes a binary choice. The probit model has the assumption that the error term, e_i , is normally distributed and can be estimated using the maximum likelihood method.

From Abe Fortas to Zoë Baird: Why Some Presidential Nominations Fail in the Senate

GLEN S. KRUTZ *Texas A&M University*

JON R. BOND *Texas A&M University*

Why, given a strong presumption of success, do some presidential nominations fail? Of 1,464 important nominations from 1965 to 1994, less than 5% failed. Ninety-four percent of failures were rejected or withdrawn before reaching the floor, suggesting that opponents are most effective during prefloor stages. We propose a theoretical framework based on the notion that policy entrepreneurs pursue their goals within the context of a presumption of success. Logit analysis tends to support the theory that entrepreneurs can alter the presumption of success and defeat a nomination if they (1) identify negative information about a nominee to provide a rationale for changing the presumption and (2) expand the conflict through committee hearings and the media. Presidential resources—high public approval and efforts to signal that the nomination is a high priority—increase the chances of confirmation. Contrary to previous research, divided government has no independent effect on the fate of nominations.

The U.S. Congress was designed to make legislating difficult. Fragmented power and multiple decision points afford those opposed to a bill ample opportunities to defeat it. In the Senate more than the House, members have significant parliamentary rights that allow them to delay action on legislation. Most bills introduced in Congress are ignored. Presidential proposals fare only slightly better—about one-fourth make it into law (Peterson 1990). In sum, for legislation introduced in Congress, there is a presumption of failure.

Nominations are different. Presidential nominees, even for the highest offices in the executive branch and the judiciary, typically are approved with little opposition (Stanley and Niemi 1994, 279). Although senatorial prerogatives to block action apply to nominations as well as to legislation, when the Senate receives a presidential nomination, there is a presumption of success. For several reasons, the Senate by tradition defers to the president in the staffing of the government and judiciary (Fisher 1991). First, the Constitution affords the president greater authority over appointments than over legislation. Furthermore, if the Senate turns down a nominee, there is no assurance that the

replacement will be less objectionable. Second, because these positions must be filled to have a well-functioning government, the Senate does not have the same leeway to ignore nominations as it does most legislative proposals. Moreover, while legislation can be amended to make it more palatable to opponents, nominees must either be accepted or rejected. Third, the president often consults with key senators before sending nominations to the Hill. Consequently, the Senate confirms all but a tiny number of presidential appointments.

Yet, some nominations run into trouble in the Senate and fail. Because of the presumption of success, explaining that failure poses an interesting question: Under what conditions does the Senate, predisposed to allow the president wide latitude in staffing the government, at times change this presumption and revert to a process more typical of its handling of legislation? We seek to answer this question with an analysis of presidential nominations from 1965 to 1994. We begin with a review of the literature, identifying gaps in our understanding of the confirmation process.

LITERATURE AND THEORETICAL FRAMEWORK

The literature provides insights about confirmation politics, but gaps remain. Much of the quantitative work has focused on nominations to the Supreme Court, analyzing senators' floor voting behavior (Cameron, Cover, and Segal 1990; Lanier 1995; Overby et al. 1992). Such analyses do not explain the collective outcome of greatest interest to the president: success or failure. Moreover, analyzing only floor votes on Supreme Court nominees provides an incomplete understanding of confirmation politics in general, since the justices are a small and unrepresentative sample of significant presidential nominations. More important, most unsuccessful nominations fail before reaching the floor, so cases defeated by floor votes are not representative of failures.

We thank the Department of Political Science at Texas A&M University and the Graduate School of Arts and Sciences at Fordham University for their support. We are grateful to George C. Edwards III and the Center for Presidential Studies at Texas A&M University for supplying data on public approval of the president's job performance from 1988 to 1994, and to Michael MacKuen for sharing his presidential events data set. We also gratefully acknowledge helpful advice from Frank Baumgartner, Greg Caldeira, Kristen Campbell, Roy Flemming, Stephen Hanna, Kim Hill, Bryan Jones, Mike MacLeod, Ken Meier, Jeff Talbert, James True, Guy Whitten, Dan Wood, and participants at the Columbia University Seminar on American Politics.

The few studies that analyze nominations more generally (e.g., Fiorina 1992) cast the empirical net too wide, analyzing all nominations (tens of thousands in most Congresses). Because only a small number are salient enough for the president and Senate to take an active interest, the many routine approvals involving minor offices may distort the results.

Previous research does provide guidance for the development of a broader theoretical understanding of confirmation politics. We propose a framework based on the notion that policy entrepreneurs pursue their goals within a context of a presumption of failure for legislation and a presumption of success for nominations.

Policy Entrepreneurs and Nominations

Policy entrepreneurs are risk takers who care deeply about issues and the actions of government (Kingdon 1984; Schneider, Teske, and Mintrom 1995). Although policy entrepreneurs may come from interest groups or from the intellectual community, at some point they must enlist the active participation (Hall 1996) of members of Congress.¹ The burden of proof differs for policy and nominations. For policy, the burden is on supporters; policy failure is most likely because it is hard to overcome the presumption of failure. For nominations, the burden is on opponents; defeat of a nominee is rare because it is hard to surmount the presumption of success.

Because of the presumption of success, supporters of nominees normally do not need to push hard to get them considered. Opponents, in contrast, face a daunting task. To change the presumption of success, opponents often use a public strategy analogous to that employed by those seeking to break up policy subsystems (Baumgartner and Jones 1993; Bosso 1987; Jones, Baumgartner, and Talbert 1993; Schattschneider 1960). Although the process does not always follow a prescribed sequence, it is useful for analytical purposes to consider two conceptually distinct phases. First, entrepreneurs portray a negative image of the nominee to provide a rationale for opposition. Second, entrepreneurs seek to expand the conflict to persuade senators to see controversy. Kingdon (1981) finds that House members go along as usual in their decision making unless they perceive controversy, in which case they seek more information and scrutinize legislation. Those opposing nominations seek to get senators into such a frame of mind. Senate rules permitting unlimited debate and the prerogative to place a "hold" on nominations allow entrepreneurs to delay action while they expand the conflict.² Because of the presumption

of success, entrepreneurs pick their battles carefully. Thus, we expect that a small proportion of nominations will be challenged and defeated.

Those opposed to a nominee must persuade additional senators to alter the normal presumption. The number of senators needed and the difficulty of persuading them vary at different points in the process. Defeating a nomination on the floor requires a majority to go on record against the nominee and the president. A defeat before that stage often takes less than a majority, and opponents do not always have to go public. Consequently, most failures never reach the floor. The visible floor defeats of Robert Bork and John Tower are unusual and unrepresentative of failed nominations.

We turn now to a discussion of rationales that entrepreneurs use as a basis for opposing a nominee and strategies to expand the conflict.

Rationale for Opposition

Opponents search for negative information in the nominee's background that can provide a rationale for opposition, including wrongdoing, a lack of qualifications, and ideological extremism.

The public expects government positions to be filled by ethical individuals who are qualified for the job. Credible evidence of wrongdoing provides a strong reason for opposing a nominee. Two examples of derailment due to such allegations are Abe Fortas, President Johnson's candidate for chief justice in 1968, and Zoë Baird, nominated for attorney general by President Clinton in 1993. Some government positions require special training and expertise. Although appropriate qualifications vary with the office, questions about a nominee's suitability can provide a basis for opposition. Examples include President Reagan's 1981 nomination of William Bell to head the Equal Employment Opportunity Commission and President Bush's 1989 nomination of William Lucas as assistant attorney general for civil rights.

More recently, ideological extremism has become another rationale for opposing nominations. From 1981 to 1994, senators challenged 20 cases on this ground, a fivefold increase over the four cases from 1965 to 1980. The increase in the use of wrongdoing or inadequate qualifications has been less dramatic: 15 cases from 1965 to 1980, compared to 29 from 1981 to 1994. The ideological extremism rationale was used to oppose President Reagan's nomination of Robert Bork to the Supreme Court in 1987 and President Clinton's nomination of Sheldon Hackney to head the National Endowment for the Humanities in 1993.³ Previous

¹ Recent research documents the increased role of interest groups in the confirmation process, especially after the failed Fortas nomination in 1968 (Caldeira, Hojnacki, and Wright 1996; Caldeira and Wright 1995; Flemming, MacLeod, and Talbert 1998).

² For this study, a "hold" was considered a temporary delay to allow the senator who placed the hold to receive additional information. Party leaders normally honor the hold and do not schedule a vote until it is removed. Although this process occurs behind the scenes and cannot be incorporated as a variable in the analysis, the

definition of failed nominations as those that are not confirmed includes cases defeated by inaction. The importance of this practice for our framework is that it allows entrepreneurs in the Senate to delay action in order to expand conflict.

³ Although some may suppose that the Bork case was the first of this type, the watershed year seems to be 1981. Bork was among the last of Reagan's appointments challenged on the ground of extreme conservatism. In 1981, for example, this objection was raised against four Reagan nominees: William French Smith for attorney general,

research finds that nominees' ideology affects the chances of confirmation (Cameron, Cover, and Segal 1990; MacKenzie 1981; Massaro 1990; Overby et al. 1992).

Some characteristics may insulate a nominee from more intense scrutiny and increase the likelihood of confirmation, such as previous approval for a different office or former membership in the Senate or House. Opposition may be less likely if a nominee has weathered a process that failed to reveal negative information, and those with congressional experience bring political (as distinct from administrative) skill to an office. Since this skill is respected by the Senate (Fenno 1959, 75–6), senators may be favorably disposed toward nominees with political and personal ties to Congress.

Expanding the Conflict in Congress

Once opponents identify a potential flaw, they exploit it by expanding the scope of conflict. In politics, how a situation (or a nominee) is perceived is often more important than objective reality. Charges of inadequate qualifications and ideological extremism are based largely on perception. Standards of wrongdoing also change over time as perceptions of what is ethical evolve, and an illegal act once considered merely a technical violation can come to be viewed as more serious. Entrepreneurs must do more than make charges about a nominee's background. They must make the case that the allegation is credible and important enough to defeat the nomination.

Two avenues for expanding conflict are (1) an internal strategy through committee hearings and (2) an external strategy that encourages scrutiny by the national media. In the rough and tumble of Washington politics, these strategies become intertwined: Revelations in a committee hearing generate additional media coverage, which leads to more hearings and tougher questioning. Therefore, separating the causal sequence is problematic, but it is useful for conceptual clarity to discuss these strategies separately. The internal strategy takes place during the confirmation hearings, which are typically low-key affairs involving the nominee and a handful of witnesses who present only positive testimony. Among the important nominations in our study, the median number of witnesses was one: solely the nominee at 52% of hearings; no more than four additional witnesses in 92% of the cases. Opponents can expand conflict by enlarging the witness list to include those who present negative testimony. This expansion is a signal to senators that the appointment deserves more attention than normal and increases the likelihood of justifying a rationale.

Ernest Lefever for assistant secretary of state, James Watt for secretary of the interior, and Anne Burford Gorsuch for EPA administrator. We cannot determine whether the increased use of this rationale resulted from more extreme candidates being named or from changes in senators' behavior. Although this is an important question, it is sufficient for this analysis to observe the addition of this rationale.

The external strategy expands conflict through increased media coverage, which also signals the Senate that a nomination should be closely scrutinized. Previous research finds that more intensive news coverage is associated with more controversial nominations (MacKenzie 1981).

Thus, opponents seek to portray a nominee in a negative light and try to expand the scope of conflict, both internally through committee hearings and externally through high media exposure. The president, however, is neither helpless nor passive in this process.

Presidential Strategies and Resources

Once a nomination becomes embattled, the president's options are limited. Going public to support a challenged nominee may draw more attention to the controversy, and presidents are constrained in how many personal appeals they can make to senators on behalf of embroiled nominees. A better strategy is to preempt the opposition. "The best point at which to manage conflict," says Schattschneider (1960, 15), "is before it starts." The president may avoid trouble by consulting with senators to identify candidates and by screening nominees in light of past controversies. For political and policy reasons, presidents still nominate controversial individuals. When a controversial name is sent to the Senate, the president may go to extra lengths to highlight positive aspects of a nominee's experience and qualifications in an effort to preempt potential opposition.

The president's popularity with the public is a resource that may influence members of Congress (Neustadt 1960). Washingtonians widely accept the view that Congress is more inclined to give presidents what they want when public support is high rather than low. Previous studies provide some empirical support for this view (Brace and Hinckley 1992; Edwards 1980; Ostrom and Simon 1985; Rivers and Rose 1985). Other research identifies methodological and theoretical reasons to question this relationship (Bond and Fleisher 1984, 1990; Collier and Sullivan 1995). Although presidential popularity may have only marginal effects on legislation, there is reason to hypothesize that it may be more significant for nominations, since it reinforces the presumption of success. Given this presumption, opposing a nominee poses risks to entrepreneurs: (1) embarrassment and damage to reputation if the opposition is unsuccessful, (2) lost time that might have been used more effectively on a legislative initiative, and (3) possible future retribution from the president. Because high popularity reinforces the presumption of success and the risks associated with opposing a nomination, entrepreneurs may wait for another case when the president is perceived to be more vulnerable.

Political Circumstances

Entrepreneurs operate under political circumstances, some of which may be more favorable to opposing nominations than others. Circumstances that may influence the confirmation process include party control

of the presidency and the Senate, timing in the president's term, and type of office involved in the nomination.

Divided Government. There are theoretical reasons to expect more failed nominations when the opposition party controls the Senate. Members of the opposition party are predisposed to disagree with the president's preferences on policy and personnel (Bond and Fleisher 1990). Under divided control, there are more of these members. More important, they hold the levers of power, chairing committees and controlling the scheduling of business. Research on Supreme Court nominations finds a relationship between party control and success (King and Riddlesperger 1991; MacKenzie 1981; Ruckman 1993; Scigliano 1971; Segal 1987). But since Senate rules bestow great power on individual senators regardless of party, this relationship may not appear in a more representative sample of nominations.

Timing. Washington time runs on the electoral calendar. Entrepreneurs may have greater difficulty challenging nominations early in the president's term. Light (1983, 44, 218) advises new presidents to "move it or lose it," because they are more successful in pursuing a legislative program during the honeymoon. It is also reasonable to expect the Senate to give newly elected presidents latitude in staffing the government. Conditions later in the president's term make it less difficult to challenge nominations. After the midterm elections, presidents typically have fewer members of their party in the Senate.⁴ As the presidential election approaches, opposition party senators have a greater incentive to deal the chief executive an embarrassing defeat, and a president running for reelection may become distracted with the campaign. A lame duck is in a weakened position even with senators from the same party, who know they will not have to run with this candidate at the top of the ticket.

Previous studies of judicial appointments suggest that timing influences confirmations. Ruckman (1993) and Scigliano (1971) found that Supreme Court nominations are more likely to fail late in the president's term. Richardson and Vines (1971) and Bond (1980) found that Congress is more likely to pass bills increasing the number of federal judges early in a presidential term.

Type of Office. Different offices evoke different expectations about the skills and experience needed to fill them, so this factor is likely to have a bearing on confirmations. And the Senate may be more likely to defer to the president on executive branch appointments than on appointments to the judiciary or independent regulatory agencies. Consequently, we control for type of office, but we do not have strong theoretical expectations regarding the direction of all the relationships.

⁴ The pattern of the president's party losing seats in midterm elections is not as consistent in the Senate as in the House. The pattern prevailed in the Senate in six of the eight midterm elections since 1966 (Ornstein, Mann, and Malbin 1996, 55).

RESEARCH DESIGN AND MEASURES

Units of Analysis

The unit of analysis is nominations considered by the U.S. Senate from 1965 to 1994, but not all these are appropriate to test our theory. Most presidential appointments each year are military and foreign service promotions that typically pass in large blocks with little scrutiny. Including such cases may distort the results. We need a subset of important nominations in which the president, senators, and other entrepreneurs are likely take an active interest, but the sample should be broad enough to be representative. We define as important all nominations to the (1) Supreme Court, (2) U.S. Circuit Courts of Appeals, and (3) level 1, 2, and 3 positions in the Federal Executive Schedule (U.S. Congress, House Committee on Post Office and Civil Service 1988 and 1992), except "inner cabinet" positions (Defense, Justice, State, and Treasury), which also include level 4 positions.⁵ This yields a sample of 1,464 important nominations from 1965 to 1994. Supreme Court and appellate court nominations comprise the most important judicial appointments. Using the Executive Schedule identifies the top positions in the executive branch and bureaucracy.

Dependent Variable

The dependent variable is the *Outcome* of a nomination (pass = 1; fail = 0). A failed nomination is one submitted to the Senate for consideration but not confirmed (U.S. Government Printing Office 1966–95a, 1966–95b, 1966–95c). Nominations may fail at several points in the process. The Senate may reject the nominee on the floor or in committee; the president may withdraw the nomination before overt rejection; the Senate may not act because a "hold" prevents it or because time runs out at the end of the session.⁶

Previous empirical studies of nominations focus on floor votes (Cameron, Cover, and Segal 1990; Lanier 1995; Overby et al. 1992). As we argued above, that provides an incomplete picture because most unsuccessful nominations fail before reaching the floor. Table 1 presents information on the point at which nominations fail. Of the 1,464 nominations in the data set, less than 5% (71) failed, which suggests that even the most important cases have a presumption of success. Yet, instances of failure are sufficiently common

⁵ The Executive Schedule has five salary levels. Cabinet secretaries and their equivalents are level 1; level 2 positions are held by undersecretaries and heads of major subcabinet agencies, such as the Department of the Army and the FBI; lower level cabinet secretaries and heads of government agencies and regulatory commissions receive level 3, 4, or 5 salaries depending on the size and prestige of the agency (Meier 1993, 39).

⁶ Two cases withdrawn before committee hearings were not coded as failures. One was President Carter's nomination for FBI director of Frank Johnson, who had a heart attack and asked to withdraw. The other was President Reagan's nomination of Frank Gaffney to be assistant secretary of defense, which was a promotion from a lower position he held in the Department of Defense. Gaffney asked to withdraw and resigned from the department because of policy disagreements with the administration.

to justify trying to identify the reasons. Of the failed nominations, more than 94% never reached the floor. This finding suggests that efforts to defeat a nominee are most effective during prefloor phases of the process. More than three-fourths of unsuccessful nominations (55) did not emerge from committee, so that appears to be the most critical stage; another 17 cases failed even earlier, before committee hearings.

Table 2 shows the percentage of important nominations that passed during various administrations. Except for presidents Ford and Reagan (second term), success rates are similar across administrations. Ford's record is likely the result of the aftermath of the Watergate scandal that elevated him to the presidency without election. The decline during Reagan's second term is similar to that in Nixon's second term. Al-

though Clinton's 97% success rate during 1993–94 is above the mean of the president's in this study, it represents the record of only two years, as opposed to four for the other presidents. This relatively high success rate does suggest, however, that the highly publicized defeats early in Clinton's first term are not representative of his record on nominations in the 103d Congress.

Success rates of recent presidents are similar to those of their predecessors, which suggests that it has not become harder to get nominees through the Senate. That is, the presumption of success on nominations prevails throughout the period of study.⁷ There is a slight divided government effect: 94% pass under split party control, compared to 97% with unified control.

Independent Variables

Nominee Factors. The nominee characteristics that entrepreneurs use as rationales for opposition are measured by four dichotomous variables (1 = yes, 0 = no) to indicate the presence or absence of a negative attribute: *Alleged Wrongdoing*, *Qualifications a Concern*, *Extreme Conservative*, and *Extreme Liberal*. Opponents alleged at least one negative attribute in about 4% (62) of the cases. Allegations of wrongdoing were most common (32 cases), followed by extreme conservatism (17 cases), qualifications (12 cases), and extreme liberalism (7 cases) (Congressional Quarterly, Inc. 1966–95).⁸

We also include measures of attributes that might insulate nominees from challenge: *Previously Confirmed* for another office and current or former members of the *House* or the *Senate* (1 = yes; 0 = no). About 36% (526) of nominees had been previously confirmed (Marquis Who's Who, Inc. 1969–97). Three percent (44) were former House members, and less than 1% (13) were former senators (Congressional Quarterly, Inc. 1993).

Expansion of Conflict. The measure of the *Scope and Tone of Testimony* in committee hearings is the ratio of negative to positive witnesses (number of negative witnesses/number of positive witnesses) (Congressional Information Service, Inc. 1966–95). Low key hearings with only the nominee testifying and larger hearings with only positive witnesses score zero. Such hearings are likely to lead to confirmation because no negative information is presented to challenge the presumption of success. Hearings with more negative than positive witnesses have scores greater than 1.00. Higher scores indicate greater controversy, which reduces the likeli-

⁷ Unfortunately, there is about a two-year lag in reporting complete hearing information on nominations. Since hearings are a key part of our model, we cannot include Clinton's experience with a Republican majority. There is some evidence that the confirmation process may have undergone some change with Republican control of the Senate. Long delays in acting on large blocs of judicial appointments in the 105th Congress may indicate that the traditional obligation to process presidential appointments to keep government operating is less compelling than in the past.

⁸ The total number of allegations is 68 because in a few cases multiple allegations were raised.

hood of confirmation. For the 1,447 cases in our data set on which hearings were held, this variable ranges from zero to 27, with a mean of .20 and a standard deviation of 1.26. The distribution, however, is highly skewed. More than 90% of hearings score zero (only positive witnesses), but there are six extreme outliers in which negative witnesses outnumbered positive witnesses by at least ten to one. Since we believe that the effect of adding negative witnesses is likely to increase rapidly at low values and then diminish, we transformed this variable with a square root function.⁹

The indicator of *Media Coverage* is the number of stories in the *New York Times* (1966–95) about the nomination prior to the date of passage or failure. The scores range from zero to 93, with a mean of 1.9 and a standard deviation of 5.1. There are a few extreme values, but this variable is less skewed than the testimony variable. About 40% (589) of the nominees in our sample received no mention in the *New York Times*, and roughly 57% received between one and ten mentions. Since this variable is not highly skewed, we did not use any nonlinear transformation.¹⁰

Presidential Variables. The president may attempt to preempt the opposition by publicly touting the merits of a nominee before sending the name to Capitol Hill. Our measure of *Initial Presidential Priority* is the number of column lines in the president's speech introducing the nominee (U.S. Government Printing Office 1966–95a). This variable ranges from zero to 203 column lines, with a mean of 19.4 and a standard deviation of 23.6. *Presidential Popularity*, a resource that might reinforce the presumption of success on nominations, is measured as the percentage approving of the way the president is handling his job in the closest Gallup poll before the nomination passes or fails (Edwards 1990). This variable ranges from 24% to 87%, with a mean of 52% and a standard deviation of 11%.

Political Circumstances. We control for several political circumstances that might affect the fate of nominations. *Divided Government* is coded 1 if the president and the Senate majority are from different parties and 0 for unified control.¹¹ About 45% (657) of the nominations in our sample were considered under divided government.

Four dummy variables were used to measure timing in a presidential term: *Early First Term*, *Late First Term*, *Early Second Term*, and *Late Second Term* (1 = early or late; 0 otherwise). Early is defined as the first year of the term; late is the fourth year. These variables test whether the probability of success in the

first and fourth years is significantly different from that in the middle years.

Finally, we included six dummy variables for type of office being filled to detect any differences across the categories: *Cabinet*, *Subcabinet*, *Executive Office of the President/White House*, *Supreme Court*, *Appellate Court*, or *Government Corporation/Regulatory Agency* (the excluded category). We do not have theoretical expectations about the direction of relationships for these variables.

Methods

Because the dependent variable is dichotomous, we used logit analysis to estimate the models. We were concerned about possible endogeneity of some right-hand side variables, especially the measures of conflict expansion. A test for simultaneous influence developed by Rivers and Vuong (1988) indicates that neither the testimony nor the media variable is endogenous (see Appendix). Therefore, we report results of standard logit models.¹²

Since alleged wrongdoing, lack of qualifications, and ideological extremism are charges raised by opponents rather than objective criteria, these might be post hoc rationalizations rather than explanations of why nominations fail. Although we cannot definitively establish causation, we identified the point in the process at which the charge was made to determine the sequence of events (*Congressional Quarterly Weekly Reports* 1965–94). If an allegation surfaces before any public action in the Senate, then the temporal sequence suggests that the rationale led to defeat, rather than the reverse. In 62 cases a negative allegation was raised, and in 89% of these it was made before any formal Senate consideration: Seven cases involved charges before the nomination, 48 cases after nomination but before Senate hearings. In the seven other cases, allegations were first raised during the hearings. In no cases did allegations emerge after hearings. Since so few charges were made after the commencement of formal Senate actions, it seems reasonable to infer that the direction of causation goes from rationale to defeat.

FINDINGS

Table 3 presents a logit analysis of the effects of the independent variables on the confirmation process. Recall from Table 1 that 17 cases were withdrawn before hearings or failed because the Senate took no action. Since there were no hearings, the testimony variable is not applicable, and there is no completely satisfactory way to deal with this missing data problem. Since we have so few failures, excluding these cases from the multivariate analysis eliminates nearly one-fourth of the failures, but efforts to impute a "tone" to hearings that never occurred seem problematical. Among the various possibilities, the process of multiple

⁹ We did not use a natural log transformation for two reasons: (1) The square root transformation is a more gentle diminishing returns function, and (2) most of our cases score zero, and the natural log of zero is undefined.

¹⁰ Using a square root transformation of this variable does not change the results.

¹¹ Some may object to using a dichotomous variable when the actual party split is available. Using the number of seats of the president's party in the Senate, however, produces similar results. This suggests that if divided government contributes to defeating nominations, the key reason is that the opposition controls the levers of power.

¹² We were also concerned that these two variables might be colinear. Their correlation is .39.

^aModel 1 excludes the seventeen failed cases with no hearing. Model 2 includes those cases and imputes a hearing witness value based on similar cases in the sample (Rubin 1987). In the case of Lani Guinier, who withdrew before hearings, for example, similar assistant attorney general nominees in the sample were identified based on values of the other independent variables. A case from this list of similar cases was then randomly selected and models estimated with that hearing value inserted for the Lani Guinier case. Logit done on SPSS for Windows, Release 7.5.2.

^bFor dummy variables, we report the change in probability from .5 if the variable goes from zero to one. For interval variables, we report the change in probability from .5 if these variables change by one and two standard deviations. Since the logit curve is steepest at .5 probability, these estimates indicate the maximum potential effect of these variables.

^cThe constant reflects the effects of government corporation/regulatory agency nominations during the second and third years of presidential terms.

imputation (Rubin 1987) seems most appropriate. Although this technique is particularly appropriate for surveys, it can be used to deal with missing data in nonsurvey designs (Rubin 1987, 3). Thus, we estimate the model two ways. Model 1 reports estimates without the 17 failures that had no hearings ($n = 1,447$), while model 2 reports estimates with hearing values imputed for these failures ($n = 1,464$). The results of both models support our expectations about negative information and the expansion of conflict.¹³

¹³ In addition to the method described in note a of Table 3, we also imputed values using predicted values from the first-stage estimates and inserting the mean value for the testimony variable. Although the coefficient for the latter is slightly smaller, it remains significant ($p < .001$), and the other findings are unchanged.

All the rationales that entrepreneurs use to portray a nominee in a negative light—alleged wrongdoing, lack of qualifications, and ideological extremism—significantly reduce the chances that the nomination will be confirmed.¹⁴ To see substantive effects, we present the change in probability of success under different values of the independent variables (Greene 1993, 638–41). Charges of not being qualified or ideological extremism reduce the probability of confirmation by at least

¹⁴ The coefficient for extreme liberal in model 1 has a p -value of .09, whereas in model 2 it passes the .05 threshold. Only seven nominees were challenged as being extreme liberals. One was Lani Guinier, whose nomination was withdrawn before hearings, so her case is not included in model 1.

one-third; alleged wrongdoing has the strongest effect, cutting the chances of success nearly in half.

Background characteristics that might insulate nominees from challenge have less influence. Those who have weathered a previous confirmation tend to be successful, but the marginal increase in the probability of success is only about 20%. Former members of Congress do not receive more favorable treatment in the Senate than nominees without congressional ties.

The models also show that both internal and external strategies to expand conflict significantly reduce the probability of confirmation. Hearings with 1.5 times more negative than positive witnesses (one standard deviation above the mean) reduce the chances by 15% (at two standard deviations above the mean, the odds drop another 10%). If media coverage increases to six stories, the probability of confirmation declines 10%.¹⁵

Presidential resources enhance the probability of confirmation. Efforts to preempt potential opposition by signaling that a nomination is a high priority increase the chance of success about 20%. Presidential popularity has a stronger influence. If public approval is one standard deviation above the mean (about eleven points), the positive effect on the probability of success is about 40%, a similar magnitude to the detrimental effects of negative nominee factors. The strong association with public approval suggests that entrepreneurs may be reluctant to assume the risks of trying to change the presumption of success on nominations when the president is extremely popular. This result stands in sharp contrast to previous findings indicating that public approval of the president has a marginal influence on legislative success in Congress (Bond and Fleisher 1990; Collier and Sullivan 1995; Edwards 1989).

Political circumstances have mixed effects. Contrary to studies of Supreme Court nominations (King and Riddlesperger 1991; MacKenzie 1981; Ruckman 1993; Scigliano 1971; Segal 1987), we find no significant independent effect of divided party control, which suggests that nominations of justices are not representative of nominations in general. Given Senate rules that bestow significant power on individuals, it is not surprising that once opponents provide a rationale and expand the conflict, they can challenge nominations about as effectively under unified as under divided control.¹⁶ Consistent with previous studies (Ruckman

1993; Scigliano 1971; Segal 1987), nominations are more likely to fail late in the president's term.

Finally, among the various types of offices, only cabinet nominations are treated differently: Nominees to head these departments are more likely to be confirmed than nominees to other offices. This result may reflect a tendency to allow the president leeway in forming his government.

CONCLUSION

In a legislative system designed to block initiatives, nominations pose a puzzle. In contrast to legislation, most nominations—even the most important cases selected for this study—pass without challenge. Our model attempts to explain why, given the presumption of success, some nominations fail. Our theoretical framework is based on the notion that policy entrepreneurs pursue their goals within the context of this presumption. If no controversy arises around a nomination, senators, committees, and the chamber go along with the president and confirm the nominee. The aim of opposition entrepreneurs, therefore, is to alter the presumption. They want senators to see controversy and to scrutinize nominees closely. We suggest that entrepreneurs accomplish this through a two-part strategy: (1) Identify negative information about a nominee to provide a rationale for changing the presumption, and (2) expand the conflict internally through committee hearings and externally in the mass media.

Our analysis of important nominations from 1965 to 1994 tends to support this theory. Less than 5% of these nominations failed. Ninety-four percent of failures were rejected or withdrawn before reaching the floor, which suggests that opponents are most effective during the prefloor stages of the process. Allegations of wrongdoing, concerns about qualifications, and ideological extremism all provide a rationale to defeat a nomination. Expansion of the conflict, as indicated by a disproportionate number of negative witnesses at the hearings and considerable coverage in the national press, also reduces the likelihood of confirmation. And nominations made late in the president's term are more likely to fail. High presidential approval and extra efforts to tout the candidate's qualifications in the president's speech announcing the nomination increase the chances of success. In addition, nominees who have been previously confirmed for another office and especially the cabinet are more likely to pass than others. Contrary to previous research, divided government has no independent effect on the fate of nominations.

These findings suggest at least two implications for our understanding of politics in Congress. First, our model's presumptions of failure for legislation and success for nominations is a useful way to think about policymaking in Congress. The tasks and strategies of policy entrepreneurs vary with these presumptions. On legislation, supporters struggle to get the proposal noticed and considered. On nominations, it is opponents who must struggle to get the attention of others.

¹⁵ Although the independent effects of expanding the conflict appear smaller than the effects of alleged negative attributes and previous confirmation, remember that these variables are measured in different units. Negative and positive nominee factors vary from minimum to maximum values (0 or 1), whereas conflict expansion variables vary from their mean by one and two standard deviations. In addition, strategies to expand conflict take place in conjunction with the use of a negative rationale by entrepreneurs, so expansion of conflict further reduces an already diminished probability.

¹⁶ We also tested for different relationships under divided and unified government. Wrongdoing, qualifications, expansion of conflict through hearings, and cabinet appointments have the same effects in both circumstances. Media coverage and previous confirmation are not significant in either. Ideological extremism is significant only under divided government, whereas presidential efforts to preempt opposition work only under unified government.

If they succeed in portraying a nominee negatively, then the president is constrained in how to help a nomination through.

Second, previous studies of floor voting focus on Supreme Court appointments and provide an incomplete understanding of confirmation politics in general. The justices represent only a fraction of the nominees to important offices that the president must get confirmed in the Senate. And defeats on the floor are a small and unrepresentative sample of the relatively rare failures. Our analysis of a broader, more representative sample of important nominations confirms some previous findings and suggests that others should not be generalized beyond the Supreme Court context.

APPENDIX

Rivers and Vuong (1988) developed a test for endogeneity in models with a dichotomous dependent variable. It is a two-stage conditional maximum likelihood estimator with several advantages, including computational ease, asymptotic efficiency, and small sample properties. The procedure provides a direct test of endogeneity of one or more right-hand-side variables.

The first step is to estimate a reduced form equation for each right-hand-side variable suspected of endogeneity. The first-stage equations include the exogenous right-hand-side variables from the full model plus others associated with the suspected endogenous variable. The second step is to include the residuals from the first-stage equations with the suspected endogenous variables in the full probit model. If residuals from the first-stage equations have large and statistically significant coefficients, then we reject the null hypothesis that the variables are exogenous.

We estimated first-stage reduced-form ordinary-least-squares regression equations for the expansion of conflict variables: *New York Times* coverage and scope and tone of testimony. OLS is appropriate because these are interval variables. In the two first-stage models, we included two variables in addition to all exogenous variables from the full model.

The additional variables in the *NYT* model are (1) *Total Hearing Witnesses* and (2) total coverage of *Presidential Events* (excluding nominations) (MacKuen 1983; updated by MacKuen) normed by the number of days the case was under consideration. As hearings feature larger numbers of potentially more newsworthy witnesses, media coverage should increase. Coverage of other presidential events indicates media appetite for presidential news.

The additional variables in the scope and tone of testimony model are (1) *Total Hearing Witnesses* and (2) *Presidential Success* rate (excluding nominations), which reflects the level of conflict between the president and Congress in the four months before and during the hearings. Calculating presidential success rates by trimester permits a more appropriate temporal matching than annual calculations; since some months lacked a vote on which the president expressed a position, an interval shorter than a trimester was precluded. The proportion of negative witnesses is likely to increase both when the total number of witnesses expands and when the president and Congress are feuding over policy (indicated by a low success rate).

Table A-1 presents the first-stage results. The media model explains 72% of the variance, and the hearings model explains 32% of the variance. The new variables and several exogenous variables from the full model are significant in both first-stage models.

In the second stage, we included the residuals from the first-stage equations in the full probit model. The coefficients of both reduced-form residuals in the full models are small and insignificant. In the full model, the *NYT* residual has a *b* of $-.29$ and *t*-statistic of $-.91$; the scope and tone of testimony residual has a *b* of 1.42 and *t*-statistic of $.25$. These results of this test indicate that neither media attention nor the tone of hearings is endogenous.

The Rivers and Vuong test was developed for probit models, and we used probit analysis for this diagnostic. In the text we report results of logit analysis because estimating substantive probabilities is more convenient. Results using probit are the same.

Macropartisanship: A Replication and Critique

MacKuen, Erikson, and Stimson (1989, 1992) argue that the aggregate distribution of party identification, or macropartisanship, shifts significantly over short periods in response to changes in presidential popularity and consumer sentiment. Their results are based on a subset of Gallup surveys available from 1953 to 1988 and only those CBS/New York Times surveys conducted during the Reagan administration. We replicate this analysis using a more extensive inventory of Gallup and CBS/New York Times data and find considerably less evidence of partisan fluctuation. The amount of partisan change caused by short-term movements in consumer sentiment and presidential popularity is found to be two to three times smaller than initially reported by MacKuen et al. (1989). Our results indicate that macropartisanship adjusts to short-term shocks in a limited and gradual fashion, consistent with traditional views of partisan realignment.

Despite the centrality of party identification to explanations of voting behavior, its nature and origins remain the subject of ongoing dispute. The traditional view of partisanship, as presented in *The American Voter* (Campbell et al. 1960), emphasizes the psychological bond that links citizens to political parties. Partisans come to see themselves as members of social groups (e.g., Democrats, Republicans) in much the same way that people incorporate religious, regional, or ethnic group memberships into their self-conception. Because it is disquieting to alter one's self-concept, particularly when it involves repudiating once-admired groups and symbols, partisan identifications that take root in young adulthood tend to persist even amid changing political circumstances. To be sure, party attachments can be disrupted in systems such as that in Canada, where new parties emerge that pit linguistic, ethnic, and regional identities against preexisting party identities (Schickler and Green 1997), or in Italy, where party labels change (Converse and Pierce 1985). But under ordinary circumstances, the distribution of partisanship is expected to adjust slowly to swings in political or economic fortunes and shift appreciably only when short-term forces favor one party for a sustained period. Party identification, as Campbell et al. (1960, 1966) argue, functions as ballast in an electoral system, stabilizing party competition amid shifting political currents.

An alternative view of partisanship, associated with scholars such as Downs (1957) and Fiorina (1981), regards party identification as a "running tally" of evaluations of party platforms and performance in office. From this vantage point, party identification

more closely resembles presidential approval than religious affiliation. Continually updated in light of current information, partisanship may undergo considerable change as events alter public confidence in each party. During certain periods, the distribution of partisanship may remain in place, but this quiescence merely reflects stability in party platforms and capabilities (Franklin and Jackson 1983).

This debate has played itself out in two research literatures. The first traces individual survey respondents over time and gauges whether partisan affiliations change as opinions about the parties change. The findings have been quite mixed. Evaluations of the parties' presidential candidates (Page and Jones 1979), issues stances (Franklin 1992; Franklin and Jackson 1983), and performance in office (Brody and Rothenberg 1988; Fiorina 1981) have been said to affect party identification, but each of these studies has drawn criticism on methodological grounds from research that finds party identification to be highly resistant to change (Green and Palmquist 1990, 1994; Schickler and Green 1993–94, 1997).

The second body of literature tracks the aggregate distribution of party identification over time. The traditional view of partisanship is challenged by time-series analyses showing that the distribution of party identification shifts markedly over short periods and moves in tandem with fluctuations in presidential popularity, consumer sentiment, or objective economic indicators of unemployment and inflation (MacKuen, Erikson, and Stimson 1989, 1992; Weisberg and Kimball 1995; Weisberg and Smith 1991). "Macropartisan" volatility, that is, abrupt shifts in the proportion of Democrats and Republicans, seems antithetical to the limited and gradual change envisioned by Campbell et al. (1960, 1966).¹

and influential demonstration that macropartisanship adjusts to fluctuations in the political environment, the work of MacKuen, Erikson, and Stimson (1989, 1992). These two works have been widely cited and justly praised for their path-breaking use of aggregate data, but their statistical analyses have not been examined closely.² Reproducing and refining these results is important for several reasons. First, the exercise illustrates the potential value of replication standards in social science (cf. Herrnson 1995; King 1995; Maisel 1995). Here is an instance in which a significant empirical question hangs in the balance, no complications arise due to the use of proprietary or confidential information, and data gathering and analytic procedures are, in principle, entirely reproducible.

Second, other time-series analyses of macropartisanship have produced conflicting results. Abramson and Ostrom (1991), using the biennial National Election Study series, detect little movement in party identification or responsiveness to short-term forces. Whiteley's (1988) Box-Jenkins analysis of the 1984 NES Continuous Monitoring Survey finds no evidence that party identification changes with fluctuating presidential and economic evaluations. Allsop and Weisberg (1988), in contrast, find a significant bivariate correlation between aggregate party identification and vote intention during this period; Weisberg and Smith (1991) find statistically significant links between partisanship and certain lags of unemployment, inflation, and presidential approval in monthly poll data from 1981 to 1986; and Weisberg and Kimball (1995) found that unemployment and approval predicted partisan movement during the Bush administration. Viewed against the backdrop of these other studies, the research by MacKuen and colleagues derives its persuasiveness from the fact that it traces short-term movements in partisanship using quarterly readings of party identification stretching over several decades.

A final reason to replicate the MacKuen et al. (1989) results concerns the sampling procedure used to generate their partisanship series. As MacKuen et al. explain (1989, p. 1140), this series was derived from a subset of Gallup polls: "The quarterly Gallup readings are themselves aggregated from bimonthly readings. Measures of macropartisanship were obtained from the Roper Center as a systematic sampling of party identification from the first Gallup survey of every odd-numbered month. We reaggregated to quarters because key economic indicators are measured quarterly."

After publication of their 1989 article, MacKuen et al. went on to gather data from all the Gallup surveys. Through personal communication with the authors, we learned that the original series used in MacKuen et al.

(1989) no longer exists.³ The data can be reconstructed crudely using the authors' graph of the quarterly values (p. 1138). Because only 138 of 140 data points seem to have been plotted, ruler and compass cannot always discern the quarter associated with each macropartisanship reading. We can, however, reconstruct the variance of the entire series (since this does not rely on the temporal sequencing of the data), estimated to be 20.92. This figure is almost exactly the value (20.93) implied by the summary statistics that MacKuen et al. report (1989, p. 1136).⁴ The complete Gallup series, by contrast, has a variance of 16.94 over this same period. It appears that sampling error accounts for 24% of the variance in the macropartisanship series used by MacKuen et al. (1989). Since lagged partisanship functions as a predictor in their analysis, sampling error raises the question of whether published results are biased, a question that can only be assessed by replicating these analyses with the more complete Gallup series.

In the sections that follow, we use the updated Gallup macropartisanship data to replicate as closely as possible the original statistical analysis undertaken by MacKuen et al. (1989). We then cross-validate our results by replicating the analysis of CBS/*New York Times* (CBS/*NYT*) data undertaken by MacKuen et al. (1992). In the process, we come upon another rationale for replication. Only by reproducing analyses reported by others can one appreciate the crucial modeling decisions upon which the results depend. Our critique leads us to move beyond replication, and in the final section we consider alternative time-series models that offer a more parsimonious account of how approval and consumer sentiment influence macropartisanship. We then estimate these models using updated partisanship, presidential approval, and consumer sentiment data. Furthermore, we take pains to show that similar results obtain regardless of whether one employs Box-Jenkins transfer function, partial adjustment, fractional integration, error correction, or vector autoregression models. Our results indicate that economic and political conditions have much less influence on partisanship than initially reported by MacKuen et al. (1989).

THE MEASUREMENT OF MACROPARTISAN CHANGE

Political scientists had become accustomed to thinking that the most noteworthy trend in the distribution of party identification was dealignment, or growing ranks of self-identified independents, when MacKuen, Erik-

² The work that comes closest to replicating the MacKuen et al. (1989) analysis is a methodology text by Cromwell et al. (1994a), which takes as its central example the causal interplay between consumer confidence and macropartisanship. But in reconstructing the MacKuen et al. analysis, the authors fail to take into account the fact that improving economic conditions have a *positive* effect on the macropartisanship series during Democratic administrations and a *negative* effect during Republican administrations.

³ Using Roper Center documents, we attempted to re-create the series using the monthly Gallup polls and the sampling procedure of MacKuen et al. (1989), but we were unable to reproduce the series they graphed on p. 1138. Because we cannot analyze the precise data used by MacKuen et al., our reanalysis is properly characterized as a replication rather than verification (Herrnson 1995, 452).

⁴ Taking the R^2 that MacKuen et al. (1989) report in their Table 3 to be an adjusted R^2 , we use the formula $\sigma^2/(1 - R^2)$ to obtain 20.93. The statistics that MacKuen et al. (1989) report in their Table N-1 suggest an even higher variance.

FIGURE 1. Macropartisanship: Gallup, CBS/NYT, and NES Surveys

son, and Stimson reshaped the terms of debate. Unlike previous students of American party affiliation, these authors relied not on the placid series of biennial NES surveys but instead on a quarterly compilation of polls conducted by the Gallup organization. Besides charting party identification outside the confines of the biennial election season, MacKuen and colleagues sidestepped the dealignment issue by dropping independents from the analysis and focusing on the relative proportions of Democrats and Republicans.

Figure 1 traces the proportion of party identifiers who called themselves Democrats in more than a thousand Gallup surveys conducted between 1953 and 1996. Corresponding figures are also presented from CBS/NYT polls (1976–96) and NES surveys (1952–96). Following MacKuen et al. (1989, 1992), we have aggregated individual surveys into quarterly data (see the Appendix for a description of how the updated series was constructed). The partisan balance, as gauged by the Gallup surveys, tips increasingly in the Democratic direction from the early 1950s until the mid-1960s. Some retrenchment occurs until the start of the Nixon administration, when Democrats begin to recapture their former dominance. With the election of Ronald Reagan, Democratic fortunes again wane. The Republican gains, halted momentarily by the recession of 1982–83, continue through the rest of the Reagan administration, so that the series ends at very nearly the same level at which it began.⁵

⁵ The volatility of the Gallup macropartisanship series in Figure 1 is partly cosmetic. Macropartisanship, as operationalized by MacKuen et al. (1989), is the proportion of all party identifiers who affiliate with the Democrats. Respondents calling themselves independents are discarded from the computation, which contributes to the

MacKuen et al. (1989, 1128) regard these fluctuations as strong prima facie evidence against the prevailing view that the partisan balance holds intact until suddenly and permanently altered by an electoral realignment.

These movements in partisanship are often of a magnitude large enough to suggest electoral realignment. Note that these shifts are not temporary but persist from quarter to quarter. Yet, they have nothing like the permanence envisioned in realignment notions. The partisan balance is not nearly so stable as *The American Voter* or critical realignment theory would lead us to expect.

As Abramson and Ostrom (1991) point out, however, swings in macropartisanship are much less evident in the NES series. Since the mid-1960s, the NES surveys have charted a gradual decline in Democratic identification. The NES trendline slices through the more volatile Gallup series; there is no sign, for example, of one of the most striking shifts in the Gallup series, the surge in Democratic affiliation between 1968 and 1978. When we look at the 22 quarters between 1954 and 1996 for which both Gallup and NES data are available, we find the NES reading of macropartisanship to have a variance of 13.2, as opposed to 19.9 for Gallup.

Why does there seem to be more movement in the Gallup series than the NES series? The list of possibilities is lengthy. In one category are contrasts in sam-

apparent volatility of the series. Suppose, for example, respondents in Poll A are 34% Democrats, 33% Republicans, and 33% independents. In Poll B, 33% call themselves Democrats, 34% Republicans, and 33% independents. This shift of one percentage point in the proportion of Democrats translates into a $50.75\% - 49.25\% = 1.5\%$ shift in macropartisanship.

pling design and procedure; few commercial polls have ever approximated the care with which the NES designs and implements its surveys. In another group are hypotheses about the effects of interview context and question wording. The Gallup surveys occur more frequently and therefore may pick up monthly changes in partisanship that would elude a biennial election survey. This feature of the Gallup series puts the partisan stability thesis to an especially demanding test, particularly as the Gallup polls often coincide with the emergence of a salient political issue or concern. One suspects that a respondent's partisan coloration may be swayed after discussing the Iran-Contra or Whitewater scandal during a half-hour interview. Moreover, the Gallup polls have used a measure of party identification that differs from the traditional NES question, which reads: "Generally speaking, do you usually think of yourself as a Republican, Democrat, Independent, or what?" The Gallup measure asks: "In politics, as of today, do you consider yourself a Republican, a Democrat, or an Independent?"

A great deal of controversy surrounds the issue of question wording. Abramson and Ostrom (1991) argue that the short-term focus of "politics as of today" accounts for the greater volatility in the Gallup series. In reply, MacKuen et al. (1992) criticize the NES series as too sparse for meaningful time-series analysis, and they offer instead an analysis based on quarterly aggregations of CBS/NYT polls, which date back to 1976 and use the NES wording. As there is no simple way to resolve this debate, any replication effort must inevitably come to terms with both Gallup and CBS/NYT series, attending to potential differences between them.

A PRELIMINARY LOOK AT THE DYNAMICS OF MACROPARTISANSHIP

From a statistical standpoint, the issue of macropartisan stability turns on the way in which the current partisan balance is shaped by its past. On the one hand, if partisanship is stable, then a sudden surge in the proportion of Republicans (due, for example, to favorable political events) should leave a long-lasting imprint on the macropartisan balance. Newly minted Republicans will by and large remain Republicans, and the ratio of Democrats to Republicans will return slowly to its long-term mean as this cohort is gradually overwhelmed by others more typical of the two-party balance. On the other hand, if partisan attachments are transitory, then *ceteris paribus* the macropartisanship series should return quickly to its long-term mean in the wake of a momentary perturbation.

A common technique used to describe the dynamic characteristics of a time series is to graph the correlations and partial correlations between macropartisanship at time t and at $t-k$. Box and Jenkins (1976) point out that series which follow a first-order autoregressive process will tend to show geometrically declining autocorrelations as k becomes large. First-order moving average processes, in contrast, will be suggested by

significant partial autocorrelations at lag 2 that decline thereafter. As Figure 2 indicates, Gallup and CBS/NYT data produce similar correlograms. The autocorrelations are initially strong (.92 and .87) and decline gradually; both series produce significant partial autocorrelations at lag 2.

The implication is that the two macropartisanship series may be characterized as ARMA(1,1) processes, which is what we would expect to observe if macropartisanship were autoregressive but measured with error.⁶ Formally, an ARMA(1,1) model may be written

$$M_t = \mu + \frac{1 - \phi L}{1 - \delta L} u_t, \quad (1)$$

where u_t is a disturbance term, and L is the lag operator, such that $Ly_t = y_{t-1}$. If we let $\alpha = \mu(1 - \delta)$, we may write this model in a form that is more readily interpretable:

$$M_t = \alpha + \delta M_{t-1} + u_t - \phi u_{t-1}. \quad (2)$$

When we estimate this ARMA model, we find $\hat{\delta}$ to be .949 (SE = .026) for Gallup 1953:1–1996:4 and .956 (SE = .027) for CBS/NYT 1976:1–1996:4. Moreover, the disturbances are drawn from narrow distributions, the standard deviations of which are 1.82 and 2.36, as shown in Table 1.

What do these results tell us about the character of macropartisan change? The fact that δ is close to one means that partisanship reverts to its mean very gradually over time. Knowing, for example, that macropartisanship stands one unit above its long-term mean today implies that one may expect it to be $.95^{16} = .44$ units above its mean four years from now. This feature of macropartisanship distinguishes it from other sorts of public opinion time series, which return to their means within a matter of months or even days. Because any change in M_t will influence M_{t+1} , a string of consecutive positive or negative disturbances can produce a gradual but substantial movement in macropartisanship. For example, if the u_t were to remain at $-.05$ indefinitely, then the result for $\delta = .95$ would be a shift of $-.05/(1 - \delta) = -.05/.05 = -1$ unit in the expected value of M_t .

If δ were exactly 1, then disturbances to the macropartisanship series would *never* decay; partisanship would be a random walk, or "integrated" series. Because integrated series present a range of statistical complications, scholars have expressed concern that macropartisanship might be a random walk (Box-Steffensmeier and Smith 1996; Cromwell, Labys, and Terrazza 1994b), but a number of empirical and theoretical considerations suggest otherwise. Not surprisingly, given their low power, direct tests using aggre-

⁶ As Beck (1991) points out, sampling variability in an autoregressive series will tend to introduce a moving average component. Because CBS/NYT interviews fewer people in a typical quarter than Gallup, its moving average component turns out to be somewhat stronger (see Table 1). Note that the consequences of sampling error tend to be overlooked in studies that have charted monthly movements in macropartisanship, often based on just a single poll reading at each point (Weisberg and Kimball 1995; Weisberg and Smith 1991).

FIGURE 2. Correlograms of Gallup and CBS/NYT Macropartisanship

gate data speak equivocally to the null hypothesis that $\delta = 1$. The augmented Dickey-Fuller test for the Gallup series from 1953 to 1996 with four lags is -2.46 , which does not reach the $p < .10$ threshold; the corresponding Phillips-Perron test is -2.80 , which does achieve $p < .10$. Simulations, however, show that when u is distributed normally with standard deviation 1.82

(as in Table 1), an integrated series that starts at 60% Democratic has less than a 5% chance of remaining within the bounds of 49–70% Democratic, based on quarterly observations since 1945. The limited range of the macropartisanship series comports with theoretical intuitions about the constraints of two-party competition. To say that the series has a unit root (i.e., $\delta = 1$) would imply that its variance is infinite, which in turn implies the implausible notion that the Democratic or Republican party could win over the entire partisan electorate (Alvarez and Katz 1996). Again, simulations show that if macropartisanship had been an integrated series with a value of 60% in 1945, then the odds would be one in three that at some point one party would have won more than 80% of the partisan identifiers.

Univariate analysis helps illuminate some of the basic dynamic properties of the macropartisanship series, in particular, the gradual pace at which it changes and returns to equilibrium. But many questions remain unanswered. What sorts of variables reside in the disturbance term? Can we identify systematic causes of quarter-to-quarter change in party identification? How much of the movement in macropartisanship over time can be attributed to these short-term forces?

THE EFFECT OF SHORT-TERM FORCES ON MACROPARTISANSHIP

MacKuen et al. (1989, 1992) argue that the aggregate distribution of party identification shifts considerably in response to fluctuations in consumer confidence and presidential approval. The more popular a sitting president, the more attractive is his party as an object of identification. This hypothesis can be tested by tracking inter- or intraadministration changes in presidential approval ratings (e.g., the transition from a disgraced Nixon in 1974 to a more popular Gerald Ford, or from the triumphant Reagan of 1984 to the scandal-beset Reagan of 1987). In addition, MacKuen et al. maintain that parties are rewarded or punished for their economic stewardship. The more buoyant the public's view of the economy, the more attractive the incumbent president's party.

MacKuen et al. (1989) examine macropartisanship, presidential approval, and consumer sentiment on a quarterly basis for the period 1953–88. Approval ratings are compiled from Gallup polls, aggregated quarterly. Economic perceptions are measured using the Michigan Index of Consumer Sentiment.⁷

⁷ In contrast to Weisberg and Smith (1991) and Weisberg and Kimball (1995), MacKuen et al. use consumer perceptions rather than objective economic indicators, such as inflation or unemployment rates. Although we do not report the results here, we find very little systematic relationship between objective economic indicators and Gallup macropartisanship. For a description of the survey questions used to build the Index of Consumer Sentiment and its

Figure 3, which charts consumer sentiment, presidential approval, and macropartisanship back to 1953, may be viewed as a brief synopsis of the economic and political vicissitudes of the postwar era. As extensive scholarship on the links between economic performance and presidential approval would lead us to expect, incumbent popularity suffered during the recessions of the late 1950s, mid-1970s, and early 1980s. The relationship between macropartisanship and the other two variables is a bit more subtle. The variability in the macropartisanship series is relatively small, and only some of the dramatic shifts in party fortunes led to macropartisan adjustment. The decline of the Democrats during the Johnson and Reagan administrations did coincide with shifts in presidential approval, but the precipitous drop in Nixon's popularity following his landslide election victory in 1972 produced only a modest increase in Democratic identification, and Carter's fall from public favor in 1977–78 led to small gains for the Republicans. This cursory examination cannot, of course, substitute for a more rigorous quantitative assessment, but it does structure our intuitions about what a statistical analysis is likely to conclude. It would be somewhat surprising to encounter statistical evidence implying that partisanship moves abruptly in response to swings in economic and political circumstances. Since that is what MacKuen et al. conclude, it

is important to retrace their steps to see how their methods may tend to produce this result.

REPLICATION OF THE MACKUEN ET AL. (1989) STUDY

MacKuen et al. (1989) rely on two time-series analyses to establish that partisanship changes in the wake of economic conditions and presidential popularity. First, they develop and estimate an elaborate Box-Jenkins time-series model (tables 2 and 3, pp. 1135–6) in which approval and economic perceptions produce immediate as well as delayed effects on macropartisanship. That analysis is then repeated using OLS regression (pp. 1140–1) in an effort to assure readers that these findings are not reducible to “mere technical wizardry” (p. 1141). Again, partisanship is found to change in response to swings in approval and consumer confidence.

The Box-Jenkins and OLS analyses, despite some notable differences, share certain key specification assumptions. Macropartisanship is modeled as a function of consumer sentiment, presidential approval, and an extensive set of variables representing historical events and administration effects. Each administration, for example, is represented by both a dummy variable and a “template that begins with a score of one at the president’s (initial) inauguration and then declines exponentially throughout his tenure in office” by a prespecified rate (p. 1133). In addition, dummy variables mark the beginning of each new administration. This brings the total number of administration control variables to 19, plus 5 variables used to mark the Iran hostage crisis, Vietnam, and other noteworthy events.

The authors say very little about why these 24 control variables belong in a model of macropartisanship, but this choice of model specification turns out to be crucial. From both a substantive and econometric standpoint, administration variables may be necessary when modeling presidential approval, because one is splicing together what are in effect distinct series for different presidents, but no such logic applies to macropartisanship. Indeed, one observes neither spikes in the series when presidents assume office nor patterns of Democratic surges in identification when a Democrat controls the White House. The cost of including an ad hoc set of dummy variables marking different periods, without theoretical justification, is that one risks overfitting the model and undercutting the apparent autoregressive character of macropartisanship (McCleary and Hay 1980). In cross-sectional analysis, irrelevant regressors are benign; in time-series analysis, irrelevant period variables introduce bias.

This point is driven home by means of a simple simulation experiment. Suppose one generates a fictitious AR(1) series for the period 1953:1–1988:1 using the formula

$$y_t = 3 + .95y_{t-1} + u_t,$$

where y_0 equals 60, and u_t is distributed i.i.d. $N(0,1)$. When one regresses the fictitious y_t on y_{t-1} and the 19

administration variables used by MacKuen et al. (all of which, of course, have a true coefficient of zero), the average estimated slope for y_{t-1} is .71 over 1000 replications. This estimate is a far cry from the true parameter of .95, and when the five event variables are added, this average slope drops to .68. Overfitting is apparent as well from the fact that the average error variance is .88, well below the true variance of 1. In effect, the inclusion of irrelevant predictors derails the estimation of this autoregressive model.

When this experiment is repeated using actual macropartisanship data (1953:1–1988:1), the same pattern turns up. Regressing M_t on M_{t-1} , one obtains an autoregressive coefficient of .91 (SE = .036), which rises to .93 (SE = .034) when an MA(1) term is included to account for sampling error in the data. When the latter model is reestimated with the 24 control variables (Z) in the equation

$$y_t = \gamma_0 + \gamma_1 y_{t-1} + Z\beta + u_t(1 - \phi L), \quad (3)$$

the autoregressive coefficient drops to .73 (SE = .084).

Notwithstanding these simulation results, one may object that good substantive grounds exist for expecting macropartisanship to move in response to international events, elections, and different presidential administrations. *Note, however, that the 24 control variables as a group do not have a statistically significant total effect on macropartisanship.* The sum of squared residuals from the estimation of equation 3 is 312.29, and the exclusion of the 24 regressors raises this sum to 406.15 ($\chi^2_{(24)} = 29.2$, $p > .10$). By contrast, each of the transition, honeymoon, event, and administration variables contributes significantly to the prediction of presidential approval. For example, the 18 honeymoon, event, and administration regressors reduce the sum of squared residuals from 2937.3 to 1328.2 ($\chi^2_{(18)} = 127.3$, $p < .05$). The contrast between party identification and presidential approval is precisely what *The American Voter* would lead us to expect. Events and changes in personae that profoundly shape presidential popularity have no total effect on macropartisanship.

Interpreting the MacKuen et al. (1989) results requires also that one attend to the manner in which they operationalize presidential approval. In a preliminary analysis, it is modeled as a function of consumer sentiment, historical events, and administration effects; these estimates are then used to purge approval of the variance attributable to consumer sentiment. Thus, when MacKuen et al. refer to “political approval” they have in mind presidential approval “minus that part of approval forecast from the economic component alone, with other parts of the model zeroed out” (p. 1140, note 10). The purged approval variable credits consumer confidence for the influence it exerts indirectly through presidential approval. The intent, in other words, is to estimate the *total effect* of consumer sentiment on macropartisanship.

We begin our replication by taking up the simplest of the MacKuen et al. analyses, the OLS regression presented in their Appendix. Let M_t represent macropartisanship, let A_{t-1} denote lagged “political” ap-

proval, and C_{t-1} lagged consumer sentiment. Call Z a matrix of administration and event variables and u_t a white noise disturbance. The OLS model estimated by MacKuen et al. may be written:

$$\begin{aligned} M_t &= \delta M_{t-1} + \gamma_1 A_{t-1} + \gamma_2 C_{t-1} + Z\beta + u_t; \\ M_t - \delta M_{t-1} &= \gamma_1 A_{t-1} + \gamma_2 C_{t-1} + Z\beta + u_t; \\ (1 - \delta L)M_t &= \gamma_1 A_{t-1} + \gamma_2 C_{t-1} + Z\beta + u_t; \\ M_t &= \frac{\gamma_1}{1 - \delta L} A_{t-1} + \frac{\gamma_2}{1 - \delta L} C_{t-1} + \frac{1}{1 - \delta L} (Z\beta) \\ &\quad + \frac{u_t}{1 - \delta L}. \end{aligned} \quad (4)$$

MacKuen et al. present statistically significant, although not substantively large, effects for both purged approval ($\gamma_1 = .13$) and consumer sentiment ($\gamma_2 = .10$). Surprisingly, given our earlier univariate analysis, the decay parameter δ (the coefficient for lagged partisanship) is estimated to be just .26. Taken together, these estimates suggest that partisan stability is something of an illusion: Net of the effects of the economy and approval, party identification is only weakly propelled by its past values.⁸

Our efforts to replicate this regression analysis proved successful for the model in which presidential approval is the dependent variable. As shown in Table 2, the lagged effects of consumer sentiment and approval are .37 (versus .29) and .38 (versus .31), respectively. Our R^2 is .93; theirs is .94. When the dependent variable becomes the comprehensive Gallup macropartisanship series, however, each of the specifications we tried produced results that were weaker than those reported by MacKuen et al. The effect of political approval (i.e., purged of consumer sentiment) is small and statistically insignificant. Replacing political approval with presidential approval increases the estimate, but it remains half the size of that obtained by MacKuen et al. The effect of consumer sentiment seems more robust, particularly when approval is omitted from the regression equation. The most striking contrast between the original results and our replication concerns the effects of lagged partisanship. Our estimate (.53) is twice what was reported originally, perhaps due to the lower reliability of the original macropartisanship series.

When the slew of control variables is pared down to include just a dummy for Democratic administrations and transitions between administrations,⁹ lagged presidential approval has no discernible effect on macropartisanship. The effects of lagged consumer sentiment

are statistically significant but small ($\beta = .03$, $SE = .01$). Meanwhile, the influence of lagged macropartisanship grows to .84. These estimates suggest that only large shifts in consumer sentiment sustained over long stretches of time would lead to appreciable movement in macropartisanship.

The Box-Jenkins model resembles the OLS model with a few technical embellishments. Whereas the OLS analysis stipulates just one dynamic parameter (δ), MacKuen et al.'s Box-Jenkins model uses three dynamic parameters to describe the rate at which changes in the political environment decay over time. Macropartisanship (M_t) is now expressed as a decaying function of *contemporaneous* approval (A_t) and consumer sentiment (C_t), a matrix of administration and event variables (Z), and an AR(1) disturbance (u_t):

$$M_t = \frac{\gamma_1}{1 - \delta_1 L} A_t + \frac{\gamma_2}{1 - \delta_2 L} C_t + Z\beta + \frac{u_t}{1 - \delta_3 L}, \quad (5)$$

where L again represents the backshift operator, such that $LA_t = A_{t-1}$.

A dynamic parameter value of zero implies that an independent variable's influence persists for just one quarter. Conversely, a value of 1 means that an independent variable's influence is felt each and every subsequent period, without decaying over time. In between these extremes, a parameter of .5 implies that an effect is full for the first period, halved for the next, halved again, and so on. When an independent variable undergoes a permanent one-unit shift, the cumulative long-term effect—given an immediate influence of γ_k and a dynamic parameter δ_k —would be $\gamma_k/(1 - \delta_k)$.

Traditional conceptions of partisanship lead one to expect each dynamic parameter to be near one (perturbations to the partisan balance die out slowly), but MacKuen et al. (1989) discover that the three estimated dynamic parameters vary markedly. MacKuen et al. obtain a large dynamic parameter estimate for consumer sentiment (.84), which suggests that changes in economic perceptions continue to influence macropartisanship long after they occur (p. 1137). Approval seems to have less staying power (.35), but there is again clear evidence of gradually dissipating influence over time. Finally, the AR(1) coefficient (δ_3) takes on the remarkable value of -.04. This estimate suggests that consumer sentiment, political approval, and the assorted administration variables account for the persistence in the macropartisanship series seen earlier in Table 1; other influences on partisanship evaporate quickly. Again, the apparent persistence of partisanship over time merely seems to reflect the persistent effects of its causal antecedents, consumer sentiment and presidential approval.

Our replication begins with the Box-Jenkins model of presidential approval. With the exception of certain administration effects, most coefficients are similar to those reported by MacKuen et al. Particularly close are the estimated coefficients for the immediate effect and dynamic parameter associated with consumer sentiment. A shift of one percentage point in consumer

⁸ MacKuen et al. regard the OLS results as confirming their thesis about partisan changeability, but in fact these estimates suggest the limited influence of economic and political perceptions. While their Box-Jenkins analysis (see below) suggests that a permanent one-point shift in consumer sentiment eventually produces a .63 adjustment in macropartisanship, their OLS results imply an adjustment of .14.

⁹ Administration transition dummies are included because consumer sentiment and approval are lagged one quarter.

Note: "Political" approval is presidential approval minus .29 times lagged consumer sentiment (see MacKuen et al. 1989, 1140-1). Regression equations include administration dummies, dynamic administration effects, and event series shown in tables 1-2 of MacKuen et al. In addition, the model of macropartisanship includes dummy variables scored 1 during a new president's first quarter. Without these transition dummies, the estimated effects of political approval and consumer sentiment are negligible: .02 (SE = .03) and -.01 (SE = .01), respectively. Replication (iv) presents estimates from a model that omits all dummies for events and administrations; this specification includes a dummy for Democratic control of the presidency and dummies marking the start of each administration.

sentiment results in an immediate .33 change in presidential approval, followed by effects that decline by a factor of .64 thereafter. Comparable estimates obtained by MacKuen et al. are .32 and .61, respectively.

After constructing the "political approval" variable (using the parameter estimates obtained by MacKuen et al.), we attempted to reproduce the results reported in Table 3 of MacKuen et al. (1989). We included all the regressors in their Table 2, not just the statistically significant predictors reported in their Table 3. Replicating the analysis with just the subset of regressors listed by MacKuen et al. in their Table 3 drives the estimated effects of consumer sentiment and approval to nil. What we present here are the *maximal* estimates of short-term effects that we uncovered during our efforts to replicate the MacKuen et al. model.

Table 3 compares our results to those obtained by MacKuen et al. In replication 1, we come fairly close. The dynamic coefficients are approximately the same, suggesting that the effects of a perturbation in the consumer sentiment series stretch over years. The decay in the effects of approval occurs more rapidly, as MacKuen et al. suggest. The principal difference between our results and theirs lies in the magnitude of the contemporaneous effects. Our coefficient for approval is half of what they estimated (.117 versus .22); for consumer sentiment, two-thirds (.066 versus .10). Another difference is that we find a stronger AR(1) coefficient, although this estimate is still much lower than that observed in our Table 1, because the MacKuen et al. model includes dummy variables for each administration. Finally, and not without important implications for the argument that partisanship wavers amid shifting party fortunes, we find no significant direct effects of historical events on macropartisanship.

How do the results change when the model is

respecified so as to eliminate the 24 administration, transition, template, and event variables? To answer this question, we reestimated the Box-Jenkins transfer function model using a mean-centered version of consumer sentiment or presidential approval, described in the Appendix. These analyses also introduce an MA(1) parameter to account for sampling error in the macropartisanship series. Although this nuance has little influence on the key parameters of interest, it remedies indications of autocorrelation among the residuals. The respecified model linking consumer sentiment and macropartisanship, for example, may be written:

$$M_t = \frac{\gamma}{1 - \delta_1 L} C_t + \frac{(1 - \phi L)u_t}{1 - \delta_2 L}. \quad (6)$$

The results of these analyses diverge markedly from the original estimates. First, the immediate influence of a change in the economic or political environment is found to be very small. The total effect of a one-unit shift in the Index of Consumer Sentiment is .029, while the direct effect of a one-point shift in approval is .059. Given these parameter estimates, only dramatic and sustained swings in political or economic fortunes would produce sizable short-run changes in macropartisanship. Second, our results paint a very different picture of long-term dynamics. MacKuen et al. find that for consumer sentiment δ_1 is large, while δ_2 is close to zero. In replication 6, the dynamic parameters associated with the AR(1) term and the effects of consumer sentiment are nearly identical (.91, .94). Far from explaining away the persistence of partisanship, the dynamic effects of consumer sentiment are what one would expect from a partial adjustment model in which $\delta_1 = \delta_2$:

Note: Omitted are parameters for dummy variables associated with each president, transitions between presidents, and templates that specify the declining effect of these transitions over time. Also omitted are coefficients associated with five event series used by MacKuen et al. (Vietnam troop levels, the attempted assassination of Reagan, Watergate, the Iran hostage crisis, and omnibus event series). Replication 5 substitutes first-order lags of consumer sentiment and political approval. Replications 6 and 7 omit event variables, administration dummies, templates, and dummies marking the start of new administrations. Consumer sentiment and political approval in these last two equations have been generated by taking the residuals from a regression in which each series (multiplied by -1 for quarters during which Republicans occupy the White House) is regressed on a dummy variable scored 1 for quarters during a Democratic administration. See Appendix for discussion of this transformation.

$$M_t = \frac{\gamma}{1 - \delta L} C_t + \frac{(1 - \phi L)u_t}{1 - \delta L} = \delta M_{t-1} + \gamma C_t + (1 - \phi L)u_t \quad (7)$$

In effect, the influence of consumer sentiment extends over a long period due to the autoregressive, or self-replicating, nature of partisanship. Replication 7 in Table 3 shows the dynamics of approval to be somewhat *weaker* than that of the error process (.68, .94), though a Wald test of the equality of these two parameters cannot reject the null at .05 ($F(1, 138) = 3.28, p > .05$).

In sum, the Box-Jenkins analysis reported by MacKuen et al. exaggerates the degree to which partisanship responds to short-term influences. In part, their findings reflect the idiosyncracies of their original macropartisanship series; when their analysis is replicated using a complete inventory of Gallup surveys, consumer sentiment and presidential approval are found to have less influence, and lagged partisanship

more. Perhaps more important than the construction of the macropartisanship series is the way MacKuen et al. specify their ARMA model. Their analysis of 139 observations requires the estimation of 29 parameters, 23 of which are associated with variables that single out particular observations or groups of successive observations. Overfitting the data in this manner distorts the dynamics of the partisanship series. Throw out the assortment of statistically insignificant and theoretically questionable control variables, and the results change dramatically: Partisanship is strongly determined by its past and responds to political or economic fortunes in a limited and gradual fashion.

mediate focus of its party identification measure, MacKuen et al. (1992) replicated their results using CBS/NYT polls, which use the NES question wording. These polls date to 1976, but MacKuen et al. (1992) analyze only the 32 quarters of the Reagan administration. Apparently due to the paucity of observations, the authors rely exclusively on an OLS regression analysis and restrict the model of macropartisanship to three lagged regressors: macropartisanship, consumer sentiment, and presidential approval (in its original unpurged form).

Table 4 compares our results and those obtained by MacKuen et al. (1992).¹⁰ Using the CBS/NYT polls, our analysis produces the same effect for approval and a slightly weaker effect for consumer sentiment. The Gallup estimates are nearly identical to those reported by MacKuen et al. (1992).

¹⁰ Exact replication of the results given in MacKuen et al. (1992) is hampered by the fact that they report an analysis using just 26 of the 32 cases, namely, those in which "both Gallup and CBS-Times measures of macropartisanship are measured for times t and $t - 1$ " (p. 479). The first-quarter observation case is lost when the data are lagged one period. Another two cases are lost because no CBS/*New York Times* polls were conducted during the fourth quarter of 1981. This leaves 29 cases. The authors neglect to mention which of the remaining quarters were omitted. We tried every possible combination of 26 cases but could not replicate exactly the published results. We came closest by dropping 1982:4 and 1988:4, but the Gallup results remained more or less as we report them.

These results corroborate the OLS analysis undertaken in MacKuen et al. (1989) in that the estimated effects of short-term forces are quite modest. Indeed, the estimates become more modest still when the analysis is replicated over a wider horizon, 1976:1-1996:4. The longer time span not only speaks to the generalizability of the earlier results but also addresses a nagging statistical issue, the small-sample bias of autoregressive models. As Table 4 makes clear, the addition of about three dozen new cases reduces the apparent effects of lagged presidential approval and consumer sentiment, even when one includes the scheme of administration variables used by MacKuen et al. (1989). Of the two short-term forces, only economic perceptions have a statistically reliable, though small, instantaneous effect (.057, .054) on macropartisanship. Absent the four administration dummy variables, even these small effects disappear.

We do not read these results to mean that partisanship is altogether unswayed by economic or political circumstances. The steady stream of small coefficients suggests that presidential popularity and consumer confidence bear some systematic relationship to the party balance. At the same time, it is important to keep in mind, particularly when discussing the Reagan era, how limited that relationship tends to be.

Time and again, statistical case studies have charted

the memorable surge in GOP identification at the end of the first Reagan term. In spring 1983, Reagan's approval rating was a mere 38%; consumer confidence was a dismal 75; and 65% of party identifiers were Democrats. By spring 1985, with Reagan's popularity at 60% and consumer confidence at 95, macropartisanship dropped to 52%—the largest short-run change in party identification ever recorded in American surveys. This sequence of events paints a vivid image, but viewed against the backdrop of the partisan movement since 1953, a shift of this magnitude is much larger than expected. The estimates in the last columns of tables 2–4, for example, imply that no more than half the observed movement in macropartisanship can be attributed to economic recovery and rebounding popularity. The remainder is due to a succession of negative residuals that perhaps reflects the transformation of southern party organization and identification during this period (Green and Schickler 1996; Hadley and Bowman 1995; Miller 1991). To attribute the abrupt shift in the partisan balance under Reagan to economic perceptions or presidential popularity (cf. Weisberg and Smith 1991) makes problematic the many instances when similar changes in political climate failed to produce partisan change (e.g., macropartisanship was 55% in spring 1990 and remained at 56% two years later, despite a decline in approval from 68% to 42% and a drop in consumer sentiment from 91 to 71). One may argue that macropartisanship was unusually responsive to short-term influences during the Reagan years, but statistical tests of structural change fall well short of significance ($p > .25$) across a variety of specifications. By focusing solely on the Reagan era, the MacKuen et al. (1992) analysis not only encounters problems of small sample size but also loses the broad historical scope that makes their 1989 study so attractive.

REVISED MODELS AND UPDATED DATA

To this point, we have worked within the modeling framework laid out by MacKuen, Erikson, and Stimson in an effort to gauge the robustness of their results. We have found that their conclusions draw strong support only from their Box-Jenkins analysis, which hinges on certain questionable modeling assumptions. Since there are almost as many time-series modeling approaches as there are data points in the macropartisanship series, we now consider how our results might change if analyzed in a different manner. Using data from 1953 through the fourth quarter of 1996, we briefly summarize results obtained from partial adjustment, error correction, fractional integration, and vector autoregression models. In each case, we mean-center the independent variables, contemporaneous approval and consumer sentiment, using the procedures described in the Appendix. This transformation obviates the need for a dummy variable marking Democratic administrations, although it should be emphasized that the results do not change if such a dummy variable is used. We also include an MA(1)

term to accommodate sampling error in the macropartisanship series.

The partial adjustment model is a special case of the transfer function model in equation 6, with δ_1 constrained to equal δ_2 . This model in effect characterizes partisanship as a self-perpetuating attitude that adjusts to accommodate new information about political and economic performance. Taking consumer sentiment as a surrogate for short-term forces, the model may be written as

$$M_t = \delta M_{t-1} + \gamma C_t + (1 - \phi L)u_t. \quad (8)$$

The error correction model is an extension of the partial adjustment specification and allows for the possibility that macropartisanship and predictors such as consumer sentiment are cointegrated or bear an equilibrium relationship to one another. One may argue, for example, that when economic confidence drops below a level that supports a certain level of partisanship, the disequilibrium is gradually corrected. If this long-term relationship is expressed as

$$M_t = \gamma C_t + \varepsilon_t,$$

then the expected change in partisanship at the current period (ΔM_t) is a function of both last period's disequilibrium ($M_t - \gamma C_t$) and recent changes in the explanatory variable (ΔC_t). This implies an error correction model of

$$\Delta M_t = \nu \Delta C_t - \alpha(M_{t-1} - \gamma C_{t-1}) + u_t.$$

Rearranging terms shows that this model augments the partial adjustment specification by introducing C_{t-1} as a predictor:

$$M_t = (1 - \alpha)M_{t-1} + \nu C_t + (\gamma - \nu)C_{t-1} + u_t. \quad (9)$$

The fractional integration model has been suggested as a way of coping with problems of aggregation. Box-Steffensmeier and Smith (1996) point out that if each individual's partisanship follows an autoregressive process with varying β_i parameters, so that

$$M_{it} = \beta_i M_{i,t-1} + u_{it}, \quad (10)$$

Then the resulting macropartisanship series may be fractionally integrated. A fractionally integrated series of order d may be written as

$$(1 - B)^d M_t = \varepsilon_t, \quad (11)$$

which for $.5 < d \leq 1$ may be expressed as an AR (∞) series:

$$\begin{aligned} \Delta M_t &= d \Delta M_{t-1} + \frac{1}{2!} d(1-d) \Delta M_{t-2} \\ &+ \frac{1}{3!} d(1-d)(2-d) \Delta M_{t-3} + \dots \varepsilon_t \end{aligned} \quad (12)$$

(Hamilton 1994, p. 449).

Fractionally integrated processes have "long memory" in that each disturbance decays very slowly. To get some sense of how slowly, consider the estimate of $d = .83$ obtained by Box-Steffensmeier and Smith (1996) in

their analysis of Gallup macropartisanship from 1953 to 1992. This estimate implies that a one-point disturbance in the first quarter of 1953 continues to boost the macropartisanship series by .36 in 2000. By comparison, a coefficient of .95 in a simple AR(1) model implies that a shock leaves virtually no trace after two decades. In this sense, Box-Steffensmeier and Smith's results go farther than ours in emphasizing the lasting consequences of partisan change.

The attraction of ARMA and ARFIMA models is that they characterize the dynamics of a time series in terms of just a few parameters. The trade-off, however, is that these models impose strong assumptions about the lag structure and rate at which causal influences die out over time. Vector autoregression models, by contrast, impose fewer constraints. Many more parameters are estimated, as each endogenous variable in a system is treated as a function of its own lags and the lags of the other variables. Just how many lags to use is an open question; somewhat arbitrarily, we have chosen to use lags of up to four quarters.

Although the four models make quite different assumptions about the process by which partisanship evolves, they offer similar assessments of the rate and extent of partisan change. Table 5 compares the average rate of quarterly change in Gallup macropartisanship across the four models. In the interests of providing the most generous assessments of change due to short-term forces, the first column is based upon the estimated *total effects* of economic change, as gauged by analyses in which consumer sentiment is the sole predictor; the basis for the second column is the estimated effects when approval is the sole predictor. The MacKuen et al. (1989) results suggest that fluctuations in consumer sentiment caused macropartisanship to change at a rate of .68 per quarter from 1953 to 1996. The corresponding figures from the four alternative models range from .16 to .25. Similarly, the estimates of MacKuen et al. imply that presidential approval has produced, on average, macropartisan change of 1.09 points per quarter, while the four

revised models put this figure between .18 and .46. By this criterion, the estimates originally reported by MacKuen et al. seem to overstate the endogeneity of partisanship by a factor of two or three.

Another way to gauge the magnitude of short-term forces is to consider the sorts of political or economic reversals that would be necessary to produce a ten-point shift in macropartisanship. The MacKuen et al. (1989) estimates ($\beta = .10$, $\delta = .84$) suggest that in order to produce a realignment of this magnitude, the Index of Consumer Sentiment must plummet from its mean (86) to its lowest recorded level (55) and remain there for five consecutive quarters (during one party's watch). By contrast, our partial adjustment estimates ($\beta = .03$, $\delta = .95$) imply that the downturn in consumer sentiment must last four years, precisely the sort of sustained economic catastrophe to which traditional realignment theories point when explaining upheavals in the party system.

As noted earlier, the list of time-series models with which to analyze macropartisanship is potentially limitless, and we could well have included others. Our experience, however, is that all of the analyses that work within the basic framework laid out by MacKuen et al. (1989)¹¹ point toward a similar conclusion: Depending on the criterion used, partisanship tends to be at least two or three times more stable than originally suggested by MacKuen et al. Unless one analyzes a short time series (or cuts a long series into short segments by introducing a host of intercepts), the recurrent finding is that the partisan balance undulates gradually as economic optimism and presidential popularity wax and wane. In this respect, partisanship is quite different from other facets of public opinion, such

¹¹ In their reply, Erikson, MacKuen, and Stimson introduce a fundamentally different macropartisanship model. In it the equilibrium level of macropartisanship is determined by innovations (rather than levels) of consumer sentiment and presidential approval. These innovations are assumed to accumulate over time without any decay whatsoever. Time will tell whether the assumptions and predictions of this new model prove to be empirically sustainable.

as the perceived competence of the parties, which shift markedly in the wake of changing economic and political circumstances (Gerber and Green 1998).

CONCLUSION

Findings purporting to show that partisanship travels with short-term forces have had a demonstrable effect on the way students of electoral politics view party identification. Tracing successive editions of leading texts, such as the *Change and Continuity* series (Abramson, Aldrich, and Rohde 1982, 161; 1995, 247) or *Controversies in American Voting Behavior* (Neimi and Weisberg 1976, 310; 1993, 268), one finds increasing skepticism toward the traditional view of party identification as an unmoved mover. Like MacKuen, Erikson, and Stimson (1989, 1139), many students of public opinion now see in decades of survey data clear evidence that "partisanship's twisting course has been shaped by the winds of political and economic fortune."

Although we take a different view of macropartisan change, this metaphor nonetheless seems apt. Wind, unlike water, alters a landscape slowly, almost imperceptibly. A political party is doubtless more successful at winning adherents when its leaders are popular and its record spotless. Skeptical though we may be of the notion that short-term changes in the political environment alter the distribution of party identifications appreciably, it would be foolish to take the position that party attachments are altogether unwavering. Identification with a party wanes somewhat when, year after year, it presides over hard times or lacks effective leadership. The question is whether shifts in partisanship are sufficiently large and abrupt to call into question traditional views of realignment and the stabilizing role that party identification plays in a party system.

MacKuen, Erikson, and Stimson argue that the relationship between short-term fluctuations and partisanship is so strong that one must speak of realignment as an ongoing process, one in which the party balance at any given time reflects recent trends in political popularity and economic optimism. Our results, which show partisan adjustment occurring at less than half the rate initially suggested by MacKuen et al. (1989), call this characterization into question. The sluggish pace at which partisanship adapts to changing circumstances means that only dramatic and *sustained* shifts in the political fortunes of a party precipitate sizable changes in the macropartisan balance. Given the ebb and flow of partisan warfare and economic performance in the United States, it is understandable that substantial, let alone cataclysmic, partisan realignments should occur so infrequently.

Construction of the Macropartisanship Series

The quarterly Gallup series for 1953:1–1988:1 is based on a complete inventory of in-person surveys. These data were provided by MacKuen, Erikson, and Stimson. (Using data from each in-person poll conducted during this period, we were able to reproduce this series with a high degree of accuracy.) In 1985, Gallup had begun to phase out personal surveys, and in 1988 gaps begin to appear in the quarterly series of personal interviews. At this point, MacKuen et al. use a weighted average of personal and phone surveys, with a correction for the pro-Republican bias of Gallup telephone surveys. We use their series through 1988:1 when seeking to replicate their results.

For extensions of their analyses, we substitute telephone surveys (again, aggregated quarterly) for 1988:2–1996:1. To correct for the pro-Republican bias of Gallup telephone polls, we add 3.537 to macropartisanship scores for 1988:2–1996:4, which is the predicted difference between personal and phone assessments of macropartisanship for 1988:2, based on a regression of phone polls on personal surveys (using quarters in which both types of Gallup surveys were conducted). It should be stressed, however, that the pattern of results we report is not sensitive to the particular manner in which the macropartisanship series is updated and adjusted. We have also analyzed the Gallup personal interview data on a poll-by-poll basis, using a Kalman filter to fill in the daily gaps between polls and to account for sampling error in any given poll. The results are very nearly identical to those presented in Table 1, suggesting that temporal aggregation of the partisanship data is not a serious problem. (See <http://pantheon.yale.edu/~gogreen/kalman.html>).

NES data were drawn from the Cumulative Data File for 1952–94 and the Early Release for 1996. Data for each survey were weighted. For surveys with a panel design, only preelection surveys were used to avoid biases due to panel attrition. CBS/NTT data were obtained from MacKuen et al. for 1976–92 and updated using RPOLL and CBS/NTT reports thereafter.

Construction of the "Political Approval" Measure

Following MacKuen et al. (1989), we estimated the regression models presented in Table 2 in a two-step manner. First, approval is regressed on the same administration and events variables, with approval lagged one quarter and consumer sentiment lagged one quarter. The lagged effect of consumer sentiment (.29, see their Table N-1) is then subtracted from approval to create a purged approval series. Second, the macropartisanship model includes the lag-1 purged approval series, lag-1 consumer sentiment, lag-1 macropartisanship, and the rest of the event and administration variables (MacKuen et al. 1989, 1140, n 13).

Notes on Alternative Box-Jenkins Specifications

In order to gauge the robustness of our results, we experimented with alternative model specifications, many of which are reported in Table 3. First, we excluded approval from the model but obtained nearly identical estimated effects for consumer sentiment, confirming that the original MacKuen et al. model estimates consumer sentiment's total effect on macropartisanship. Next, we substituted presidential approval for "political" approval and found that consumer

sentiment exerts no direct effect on macropartisanship, net of presidential evaluations. Conversely, we discarded consumer sentiment and focused on presidential approval (which no longer had to be purged, since consumer sentiment was absent from the model). We found statistically significant coefficients for the immediate effect of approval and its rate of decay, but both were notably smaller than what MacKuen et al. report. Finally, we approximated the OLS specification by lagging both consumer sentiment and political approval one period. No significant immediate or dynamic parameter estimates were obtained for either variable ($p > .05$).

Procedures for Mean-Centering Approval and Consumer Sentiment

Higher values of consumer sentiment and presidential approval should produce rising macropartisanship scores during Democratic administrations and decreasing scores during Republican administrations. The Index of Consumer Sentiment may be said to comprise two parallel series, each with opposite effects, one for Democratic administrations and one for Republican. In an earlier version of this essay we verified empirically that predictors such as consumer sentiment have equal and opposite effects during periods of Republican and Democratic party control. For efficiency, we generate a single mean-centered series by taking residuals from a regression in which consumer sentiment (multiplied by -1 for Republican quarters) is regressed on a dummy variable scored 1 for Democratic quarters. A similar procedure is used for presidential approval. This mean-centering approach produces results that are very similar to those obtained simply by including a dummy for Democratic administrations in equations in which macropartisanship is the dependent variable.

Partial Adjustment Model

Table A-1 presents the results of a series of partial adjustment models in which macropartisanship is regressed on consumer sentiment, approval, or both. The results are similar to the last columns in tables 3 and 4. Unlike the Box-Jenkins models in Table 3, the partisan adjustment

model assumes that the effects of disturbances and short-term forces decay at the same rate. Unlike the models in Table 4, those presented in Table A-1 include an MA(1) term and contemporaneous regressors.

Fractional Integration

Although the long-term implications of fractional integration and ARMA(1,1) models differ, the two models are hard to distinguish with 176 observations. Indeed, the macropartisanship scores predicted by the ARMA(1,1) and ARFIMA(0,d,0) models correlate at .999. Not surprisingly, then, an ARFIMA model that includes consumer sentiment and presidential approval as predictors produces results similar to the partial adjustment analysis reported above. When consumer sentiment is the independent variable, the effect is .025 (SE = .009) with $\hat{d} = .772$, implying an average quarterly movement of .16 in the Gallup macropartisanship series. When approval replaces consumer sentiment, its effect is .025 (SE = .008), and $\hat{d} = .785$. These estimates translate into a rate of change of just .18 per quarter.

Whether fractional integration is an appropriate model for these data is unclear. A fractional integration parameter 7.5 implies that the macropartisanship series is mean-reverting but not covariance stationary. Time will tell whether the autocorrelation function for these data changes as new observations are added. It should be noted, however, that for 1953–96 the autocorrelations for the Gallup series become negative at the 29th lag. When fractionally integrated series with 176 observations are simulated with $\hat{d} = .83$, only 25% display negative autocorrelations before lag 30, and the median lag is 40. For AR(1) processes with an autoregressive coefficient of .95, the comparable figures are 60% and 25.

Vector Autoregression

The estimates used to generate the statistics reported in Table 5 were drawn from a VAR in which macropartisanship was regressed on its first four lags and the first four lags of either approval or consumer sentiment. Impulse functions from models in which both approval and consumer sentiment

are included as predictors (using the ordering consumer sentiment, approval, macropartisanship) produce similar results.

Estimation of Error Correction Model

Engle and Granger (1987) present a two-stage method of estimation, but this is most efficient when the correlation between the variables is close to one, which is manifestly not the case for partisanship and either approval or consumer confidence. We follow Beck (1991) and others in using a simpler one-equation method. We have also included the MA(1) term as in the partial adjustment model.

The results are shown in Table A-2 and coincide with what we have obtained using other techniques. The Gallup macropartisanship series is more responsive to short-term forces than the corresponding CBS/NYT series. The immediate effects of approval on macropartisanship, which come through strongly in the Gallup analysis (.095, SE = .020), prove much weaker (.040, SE = .035) when using CBS/NYT data, perhaps due to differences in question wording or the fact that presidential approval is measured using Gallup polls. Evidence of economic adjustment also is weaker in the case of CBS/NYT, as the immediate adjustment parameter is incorrectly signed. These results collectively suggest that macropartisanship changes with fluctuating political and economic conditions, but to a lesser extent than suggested by MacKuen et al. (1989, 1992).

What Moves Macropartisanship? A Response to Green, Palmquist, and Schickler

Contrary to the claim by Green, Palmquist, and Schickler (1998), macropartisanship is largely shaped by presidential approval and consumer sentiment. It is not the case, however, that macropartisanship mirrors the ever-changing levels of current presidential popularity and prosperity. Rather, macropartisanship reflects the cumulation of political and economic news that shapes approval and consumer sentiment. Using ECM technology, we show that, far from being the weak force that Green et al. suggest, the cumulation of innovations in presidential approval and consumer sentiment largely account for the long-term trends in macropartisanship. For forecasting macropartisanship in the near future, it is better to predict from the fundamentals represented by the history of approval and consumer sentiment up to a given moment than from current values of macropartisanship itself.

When "Macropartisanship" was written almost a decade ago (MacKuen, Erikson, and Stimson 1989), we saw our contribution as the following basic points. First, we showed that macrolevel party identification undergoes considerable movement over time. Second, we showed that much of this movement tracks changes in presidential approval and the economy as monitored by the Michigan Index of Consumer Sentiment. In retrospect, "Macropartisanship" is remarkable for what it did *not* say. Apart from chiding the then conventional view that national partisan sentiment seldom moves except when shaken by rare "realignments," the article offered few specifics about the nature of the macropartisanship time series. And it offered no specific viewpoint about microlevel party identification, other than dutifully citing competing "schools" ("psychological attachment" versus "running tally"). The motivating theoretical argument of that article, evidently original for its time, was that the relative stability of microlevel party identification did not logically require that macrolevel partisanship be a constant. These empirical results merely put partisanship back in the realm of politics.

Green, Palmquist, and Schickler (1998) charge that our earlier work seriously overestimated the effects of consumer sentiment and presidential approval on macropartisanship. More may be at stake than the size of a

few coefficients. As they tell it, their revisionary interpretation helps to vindicate both the microlevel theory of party identification as a stable psychological attachment and the macrolevel theory of a partisan division largely immune from major political shocks. In their preferred model, macropartisanship is a stationary series oscillating in long cycles around its long-term mean, propelled largely by shocks of unknown origin. Curiously, they offer no discussion of the possible implications of this model, which suggests that party fortune is little affected by party performance.

Green, Palmquist, and Schickler are able researchers, but in this instance they manage to overlook effects that are hiding in plain sight. We welcome this opportunity to set the record straight. In our response, we emphasize two major points.

First, *macropartisanship is driven largely by the same political and economic forces that drive presidential approval and consumer sentiment*. When political and economic events cause approval and sentiment to change, macropartisanship also changes. The changes are small but permanent and cumulating, so that macropartisanship at any moment is largely the sum of the preceding economic and political shocks. Changes in macropartisanship from other sources that do not register in the approval and sentiment series (such as election campaigns and their aftermath) are mostly transient and of little long-term consequence.

Second, *the perceived inconsistency between macrolevel movement and microlevel stability is nothing more than a statistical illusion*. Our macrolevel evidence and interpretation are in harmony with the evidence and interpretation (e.g., Campbell et al. 1960; Green and Palmquist 1994) that microlevel party identification behaves as a stable psychological attachment.

Putting the parts together, we offer the following model for reconciliation of macrolevel and microlevel findings. (1) The time series of individual-level party identification represents an initial partisan disposition that is slowly modified by events, including the national political and economic forces that shape party fortune. (2) The macropartisanship time series is dominated by

the cumulation of these national political and economic forces.

THE STATISTICAL ARGUMENT OF GREEN AND COLLEAGUES

Figure 1 presents the time series of *Macropartisanship* (here, percentage of partisans for the presidential party), Gallup's *Presidential Approval*, and the *Michigan Index of Consumer Sentiment* for nine administrations. The graphed lines represent the raw data, unadulterated except for the standardization of scales to enhance the visual display.¹ As we view these data, party identification tracks approval, which tracks consumer sentiment. Not all approval trends stem from consumer sentiment. But virtually all detectable shifts in macropartisanship reflect the movement of approval and (perhaps indirectly) consumer sentiment.

Does this informal assessment stand up to statistical scrutiny? Green et al. say "no." While accepting our assessment of the effect of consumer sentiment on approval (MacKuen et al. 1989), they claim that we exaggerate these variables' influence on macropartisanship. They believe we "overfit" the data, particularly

by our use of dummy variables for presidential administrations as controls. They prefer to report results without these controls, due to the presidential dummies' alleged lack of theoretical relevance. Their imposition of this statistical rule appreciably diminishes the coefficients for consumer sentiment and presidential approval and by itself accounts for much of the present disagreement.² Virtually all the ambiguity that they generate regarding our earlier claims is due to their omission of controls for presidential administration.

Table 1 presents two versions of a partial adjustment model predicting macropartisanship (percentage of Democrats among Democratic and Republican partisans) from current (Gallup) approval, one with and one without the presidential dummies.³ (Consumer

¹ In Figure 1, the Michigan Index of Consumer Sentiment (MICS) and presidential approval are scaled in standard deviation units, while macropartisanship is scaled in 1.5 standard deviation units. This calibration allows approximately identical variances to the change scores in the three variables. Each series is depicted as centered around the within-administration mean, with the approval series centered two units higher than MICS and macropartisanship centered two units higher than approval.

² Not a matter of contention is use by Green et al. of *all* available Gallup surveys rather than the sample we used in our 1989 work. Their better measure of macropartisanship allows them to revise downward the coefficients for consumer sentiment and presidential (or "political") approval, while revising upward the coefficients for lagged macropartisanship. As they explain, the revised coefficients follow from the improved measurement of the control variable of lagged partisanship. We accept the revised numbers from their replications over our original coefficients when applied to our original models.

³ Table 1 includes an MA(1) term to replicate the statistical practice of our replicators. The statistical analysis is virtually unchanged when the MA(1) term is omitted. The justification for the MA(1) by Green et al. is that it serves as an adjustment for sampling error, following Beck (1989). Yet, this adjustment is valid only when the underlying model is an AR(1) process, which we see as invalid for the macropartisanship data (discussed later). If the model were AR(1), then the

sentiment is omitted here because its effect is largely indirect.) As the table shows, the approval coefficient is virtually cut in half when the presidential dummies are eliminated.⁴ How should one interpret this result?

The larger approval coefficient with the dummies represents the averaging over nine separate *within*-administration time series (Eisenhower through Clinton I), controlling away between-administration differences. For each administration, support for the presidential party is highest when approval is highest: about one point of macropartisanship gained for every ten points of approval. Green et al. would have us mingle different presidents of the same party, leaving between-administration differences uncontrolled and thus leaving open the door to unwanted noise and potential biases. Does this matter?

The presidential dummies are collectively significant at the .00006 level, a magnitude that may surprise readers of Green et al. (1998).⁵ These dummies represent different equation intercepts for different presidents, reflecting the variation in party history that each president inherits. Statistically, these controls can only reduce bias rather than add bias, and at the trivial cost of a few degrees of freedom. The claim of theoretical irrelevance by Green et al. notwithstanding, on strictly statistical grounds the higher estimate of an approval effect with the administration controls is decisively better.

Still, Green et al. have a point. Why should the presidential administration matter? Rather than deny the existence of this effect, as Green et al. prefer, let us try to understand it. The dummy coefficients in Table 1 do not represent presidential characteristics but the partisan nature of the times. The base categories are

implied proportion of the variance in the dependent variable due to measurement error would be (using Green et al. symbols) $-(1 - \phi L)/\gamma_0$, or minus the ratio of the MA(1) coefficient to the autoregressive coefficient. This ratio is persistently .2 or higher in the Green et al. analysis, suggesting an implausible degree of sampling error in political surveys. Based on average quarterly *N*s exceeding 4,000 (Gallup) and 2,500 (CBS/NTT) and sampling theory, we estimate the reliability of macropartisanship to be .98 in the Gallup series and .96 in the CBS/NTT series. This comfortable level of accuracy does not call for debatable attempts at correction. To avoid making the analysis any more complicated than necessary, we do not include an MA(1) term in our original analysis which follows. Fortunately, all substantive findings are virtually unaffected by the presence or absence of an MA(1) term in the equation.

⁴ The Table 1 equation without dummy variables is virtually identical to the first equation in Table A-1 of Green et al. In this and following data analyses, we use the Green et al. data set, except that we do not mingle approval ratings for different presidents for the same quarter. We use Kennedy's approval numbers for 1963:4; and Nixon's approval numbers for 1974:3.

⁵ Green et al. appear to argue that administration dummies are not statistically significant. They report that our "slew" of 24 control variables, including the administration dummies, is not collectively significant for the period of our 1989 study. But that is without MICS or approval in the equation! Indeed, administration dummies achieve no more than borderline significance when the dummies and lagged macropartisanship are alone on the right-hand side of the equation. The reason the dummies gain dramatically in significance when approval is entered into the equation will become clear as the discussion progresses. Presidential dummies are proxies for the equilibrium level of macropartisanship derived from cumulative political and economic approval over time.

zero for Eisenhower (for Republican administrations) and Kennedy (for Democratic administrations). The coefficients are near zero for Johnson and Nixon but then turn sharply Democratic for Ford and Carter, as a post-Watergate legacy, and sharply Republican for Reagan, Bush, and Clinton, after partisan fortune turned again in the 1980s and 1990s. The dummy variable coefficients remind us that partisanship is a function not only of political and economic conditions of the moment but also of the political and economic history leading up to that moment.

The contrast between the Carter and Clinton I administrations provides a useful illustration. Within each administration, higher approval (along with consumer sentiment) is associated with higher Democratic partisanship, just as one might expect. The story changes when we look *between* administrations. On average, Clinton enjoyed better approval numbers (and

better economic numbers) than Carter, yet Americans were more Democratic in the late 1970s than in the mid-1990s. This should surprise no one who knows the political history preceding Carter (the Watergate debacle) and Clinton (the Reagan-Bush successes). Any analysis that fails to incorporate that recent history would mistakenly conclude that good economic management and political approval produce partisan failure.

It is often said that categorical dummy variables of the sort represented by presidential administrations represent theoretical ignorance. If they matter statistically, then they control for something important, even if we do not know precisely what it is. Our next task is to identify that something. Calling it history is only the beginning. We refine our model to demonstrate the economic and political forces affecting macropartisanship, while rendering unnecessary a resort to presidential dummy variables, and we learn something important about the nature of partisan change.

A REFORMULATION

Consider again the three time series depicted in Figure 1. Statistically, consumer sentiment and presidential approval can be modeled as AR(1) *stationary* series, where current values are a function of values lagged one quarter:⁶

$$Approval_t = 3.792 + 0.917 Approval_{t-1} + a_t \quad (1)$$

and

$$MICS_t = 8.998 + 0.897 MICS_{t-1} + e_t \quad (2)$$

The terms e_t and a_t represent the innovations in the two series. Given the autoregressive coefficients of about .90, the innovations dissipate at a fairly rapid rate, about 10% per quarter, which limits the ability to forecast several quarters ahead. In effect, the electorate "forgets." It weighs recent inputs most heavily, discounting the past about .10 more each passing quarter. All this is reasonable. It makes sense for consumer sentiment to mirror the current economic circumstances more than those of the past. It makes sense for the president's approval rating to mirror current successes and failures more than those of the past.⁷

Macropartisanship, we argue, is different. Let us consider the implications of a partisanship that is not

only the enduring trait emphasized by the traditionalists (e.g., Campbell et al. 1960; Miller and Shanks, 1996) but also changeable in response to events as emphasized by revisionists (e.g., Fiorina 1981; Franklin and Jackson 1983; Weisberg and Smith 1991). According to the original portrayal of partisanship as a stable attachment, people's fundamental feelings about the parties rarely change. If, in the extreme, virtually all partisanship is learned by early adulthood, then aggregate partisanship could change only glacially, as a function of the shifting partisanship of successive birth cohorts that enter and exit the system. Call this model I. Macropartisanship would be essentially a constant. Consider the other extreme: routine shifts in partisanship according to current evaluations of the president and the economy, along with perhaps other variables. Aggregate partisanship would reflect aggregate values of these predictor variables, with a memory no longer than the predictor variables themselves. Call this model II. Macropartisanship would move as a stationary series, reflecting the recent political and economic environment. We could aggregate the two models, making the near-constant birth-cohort component of model I the long-term equilibrium, while political and economic events generate a stationary series around it. Call this hybrid model III. While it anchors the equilibrium component of the stationary series by attributing it to aggregated early partisan socialization, its empirical prediction is indistinguishable from that of model II.

Our challenge is that none of these models fit empirically. Model I cannot be true by the simple test that macropartisanship moves too much. Models II and III do not fit the data well (at least without adding time-dependent dummy variables), which we know from Green et al. (1998). This verdict presents the following puzzle. How may partisanship (1) be largely shaped by early political learning and remain essentially stable during adulthood, (2) show real change in the aggregate, and (3) be effectively modeled as a function of its political and economic environment?⁸

Our solution is a revised blending of the two models of partisanship as permanence and change. To the extent the partisanship of mature adults is constrained by early socialization, in effect there must be no "forgetting" of partisan information learned during early adulthood, adolescence, and before. Of course, we also expect partisan learning to continue during adulthood. We suggest that the retention rate for partisan learning should not depend on the location in the partisan life cycle. *If early socialization leaves a permanent imprint, then any later changes in partisan disposition must also be permanent.* It makes no sense to argue that people discount their recent past but cannot shake off their distant past.⁹ Thus, we expect the equilibrium value of partisanship (macro and micro) to

⁶ For the estimated innovations in approval, only the lagged innovations for the current president are used. While this rule allows us to estimate innovations for the first quarter of the Johnson and Ford administrations, it means we must omit each presidential transition in the inaugural quarter following a presidential election.

⁷ The approval and MICS series can be validated as stationary instead of unit-root by the conservative Dickey-Fuller test. The hypothesis that MICS is unit-root can be rejected at the .05 level ($|t| = 3.03$). Perhaps surprisingly, the verdict for approval is more ambivalent. The hypothesis that approval is unit-root can be rejected at the .10 level but just misses the .05 level ($|t| = 2.79$) using the quarterly series. When approval is measured monthly, however, the unit-root hypothesis is rejected at the more stringent .05 level. For earlier discussions, see Ostrom and Smith 1992 and Beck 1992. The approval and MICS series each show the autocorrelation pattern consistent with an AR(1) model.

⁸ One resolution is that macropartisanship moves a lot, but for reasons that have little to do with the observable political and economic environment.

⁹ By the same logic, if recent effects are transient, then those from the distant past are even more so. For most people, the effects of childhood socialization would be long forgotten.

represent the cumulation of its various causes, with no "forgetting."

This reasoning implies that while partisanship changes only slowly, its changes are permanent rather than transitory. When political and economic events affect presidential approval and/or consumer sentiment, the corresponding effect on macropartisanship will be small. But while these influences on approval or consumer sentiment wear off quickly, the small effects on macropartisanship stay, so that macropartisanship represents the accumulation of political and economic news.

Crucial to our understanding is that the stable, integrated series represents partisanship at equilibrium rather than its observed (macro or micro) realization. At the individual level, this formulation is consistent with Green and Palmquist's (1990, 1994) statistical portrayal of individual-level stable party attachments that rarely change. Most adults work out a social and psychological niche in which they encounter information, or interpret information, in ways that rarely threaten their understanding of the party system. While people can and do see reasons for changing their party loyalty, other factors usually "bring them home." These include psychological mechanisms, such as selective perception, internal counterarguing, and a need for psychological order; they also include such social elements as the issue considerations that frame political argument, the weight and direction of the frequently consulted mass media, and, of course, the political views of relevant others. For most people most of the time, these conditions and mechanisms will remain in balance. Thus, partisanship itself is not merely a verbal self-description but is the product of a self-regulating social and psychological system. Crucially, partisanship is a marker for the equilibrium conditions generated by a constellation of social and psychological forces. The equilibrating nature of partisanship (macro and micro) is important for politics because the resulting stability anchors the future to provide predictability.¹⁰

Equilibrium partisanship implies a distinctive dynamic: When party identification is at equilibrium, it will not change without outside surprises. Simply speaking, a Democrat with Democratic friends and liberal policy views who lives during good times presided over by a Democratic government will remain a Democrat unless something remarkable happens. Of course, unusual events may change the mix—the individual may move into new friendship circles, the national issue debate may induce conservatism, or the performance of the parties may fluctuate. To the extent to which these factors constitute the equilibrating mechanism, equilibrium partisanship will change in response to these shocks. Thus, we have $\Delta PID_{it}^* = u_{it}$, where PID_{it}^* is an individual's equilibrium parti-

sanship, and u_{it} is the shock or innovation at any time. This implies that equilibrium partisanship is a cumulation of all previous innovations in the individual's lifetime (plus an initial partisanship)¹¹:

$$PID_t^* = (u_{it} + u_{i,t-1} + u_{i,t-2} + \dots) + PID_0^*.$$

In addition, we expect some people to stray temporarily from their equilibrium partisanship—perhaps attracted by particular personalities or moved by specific events. For instance, the Democratic partisan of our example may be seduced by a charismatic candidate to support the Republicans but will sooner than later "return home" to equilibrium partisanship. This produces:

$$\Delta PID_{it} = -\gamma(PID_{i,t-1} - PID_{i,t-1}^*) + v_{it},$$

where $(PID_{i,t} - PID_{i,t}^*)$ is the temporary deviation from equilibrium partisanship, and v_{it} represents short-term forces that deflect voters from their partisan equilibrium. These temporary deviations are based entirely in the present and are eventually "forgotten." Thus, equilibrium partisanship integrates history, whereas the temporary deviations disappear. These two parts imply that, to the extent to which equilibrium partisanship itself is unaffected by the personal environment and national forces, all movement will represent temporary deviation, and individual partisanship itself should be a stationary series.

At the macrolevel, the individual-level u_{it} and v_{it} shocks cancel out, except for their mean values, which we label α_t and ϵ_t , respectively. The macrolevel extension is straightforward. We have an observed macropartisanship, M_t , and its equilibrium value, M_t^* , where:

$$\Delta M_t^* = \alpha_t,$$

$$M_t^* = (\alpha_t + \alpha_{t-1} + \alpha_{t-2} + \dots),$$

and

$$\Delta M_t = -\gamma(M_{t-1} - M_{t-1}^*) + \epsilon_t.$$

The α_t inputs for macropartisanship represent the cumulated political and economic shocks to macropartisanship.¹² But we need not represent these shocks as mere white noise. We model the cumulated α_t as a function of the cumulated shocks to presidential approval and consumer sentiment. Our argument is that to know the cumulated political and economic shocks to approval and consumer sentiment is largely to know the equilibrium value of partisanship. Next, we put this argument to the test.

¹¹ Note that $\Delta PID_{it}^* = u_{it}$ can be written $PID_{it}^* = PID_{i,t-1}^* + u_{it}$. We may take this last expression, substitute $PID_{i,t-1}^* = PID_{i,t-2}^* + u_{i,t-2}$ for $PID_{i,t-1}^*$, and repeat substituting recursively to generate a model of PID_{it}^* as an accumulation of innovations.

¹² A potential complication is that the γ term should be subscripted for individuals, as if different people have different autoregressive terms for the short-term component (see Box-Steffensmeier and Smith 1996, 1998). The possibility that the short-term component of partisanship may be fractionally integrated is beyond the scope of our attention here.

¹⁰ This equilibrium partisanship is consistent with partisanship as self-identification as well as partisanship as a running tally, where the citizen accumulates evidence regarding the parties' relative advantages. These two equilibrating mechanisms may be less distinct in reality than in abstract theory.

FROM THEORY TO ANALYSIS

In practice, macropartisanship decidedly does not behave as a stationary series. As Box-Steffensmeier and Smith (1996, 1998) observe, macropartisanship is long-memoried.¹³ Box-Steffensmeier and Smith diagnose the series as “fractionally integrated,” meaning as a composite representing a density of different AR(1) series. We find it satisfactory to model it more simply, as a cumulative series (integrated of order 1) plus a short-term stationary component. The cumulative series represents the aggregated partisan dispositions of citizens—in effect the collective equilibrium that itself changes in response to economic and political shocks. The short-term series represents the short-term variation around equilibrium.

We are now ready to reexamine the responsiveness of macropartisanship to economic and political forces. We want to model M_t^* , the equilibrium condition of macropartisanship (M_t). For M_t^* to be statistically integrated (no “forgetting”), current innovations must be uncorrelated with lagged values. This condition is readily accomplished by modeling macropartisanship not as a function of consumer sentiment and approval per se, but as a function of the *innovations* in these variables, e_t and a_t from equations 1 and 2. In this formulation, changes in consumer sentiment and presidential approval do not directly cause macropartisanship; rather, the economic and political events responsible for these changes also cause macropartisanship to change. The innovations in consumer sentiment and approval represent surprises, that is, changes in the economic or political climate unanticipated by the previous levels of consumer sentiment and approval.

Before we proceed, there are a few additional preliminaries. To gauge how the dynamics evolve, it is helpful to separate the flows of political and economic influences on M_t^* . Consumer sentiment reflects the workings of economic forces that operate largely but not entirely via approval. Complicating matters is the greater delay in the effects of economic news compared to political news. Consequently, we purge the innovations in approval (a_t) of the portion due to economic news (e_t). We do this by regressing a_t on e_t and e_{t-1} , taking residuals. These new residuals represent the political innovations (p_t) in approval, purged of the economic innovations. We also must adjust both sets of innovations to take into account the party controlling the presidency. We do so by multiplying each by a party variable scored +1 when the president is a Democrat and -1 when the president is a Republican, while scaling macropartisanship as the percentage of Democrats. In this way, good news adds to Democratic identification, given a Democratic president, but sub-

tracts from it in the case of a Republican president.¹⁴ Finally, we measure the cumulated versions of the p_t and e_t series. We start each cumulative series at 0 in 1953:1 and add scores.¹⁵

MACROPARTISANSHIP, POLITICS, AND THE ECONOMY

Armed with theory and data, we test the plausibility of our dynamic equilibrium formulation. In the Green et al. model, macropartisanship responds minimally and gradually to political and economic innovations, eventually trending toward a constant long-term equilibrium. In our proposed model, macropartisanship cumulates the effects of political and economic forces, thus undergoing permanent changes over time. We construct an error correction model (ECM) of change in macropartisanship as a function of the innovations in political and economic news plus the reequilibration of previous “errors” toward the equilibrium level of macropartisanship. We explicitly specify the equilibrium level to be a cumulative function of political and economic conditions. In abstract form, the model is:

$$\Delta M_t = b_E E_t + b_P P_t - \gamma(M_{t-1} - M_{t-1}^*) + u_t, \quad (3)$$

and the equilibrium is:

$$M_{t-1}^* = c_0 + c_E \text{Cum} E_{t-1} + c_P \text{Cum} P_{t-1}, \quad (3a)$$

where E_t and P_t are current economic and political innovations (capitalized to signify their status as independent variables), and $\text{Cum} E_{t-1}$ and $\text{Cum} P_{t-1}$ are the lagged *cumulative* economic and political innovations. (For an expanded discussion of the error correction model and its application to the problem at hand, see the Appendix.)

This model incorporates both of the dynamic formulations we wish to test. If the equilibrium M_t^* were a constant or driven by forces other than political and economic news, then we should estimate zero coefficients for c_E and c_P . Such a condition would reduce equation 3 to a model in which macropartisanship is a function of disturbances in the political economy that dissipate over time. Thus, the key test lies in the coefficients c_E and c_P . If they are zero, then we can adequately model the political part of macropartisanship as a gradual transitory process. If they are not zero, then the effects of the political economy persist in the form of equilibrium macropartisanship. (See also the discussion in the Appendix.) Using the Gallup macropartisanship series, the estimates are:¹⁶

$$\Delta M_t^G = 0.055E_t + 0.111P_t - 0.198(M_{t-1}^G - M_{t-1}^{G*}),$$

St. Err. = (0.027) (0.029) (0.044) (4)

¹³ One sign is that the over-time correlations are far stronger than they should be, given the autocorrelations at short lags. For instance, considering that the Gallup autocorrelation is .92 over one quarter and assuming an AR(1) model, the autocorrelation should be .92¹² after 12 quarters, or a mere .37. The observed autocorrelation after 12 quarters is .58, indicating a long-memoried process. By contrast, after 12 quarters the autocorrelations for MICS and approval (same president) drop to .18 and .08.

¹⁴ An alternative to cumulating simple residuals would be to cumulate “recursive” residuals. See the Appendix for a discussion.

¹⁵ For inaugural quarters we have no measure of political innovations because we have no lagged approval scores for the new president. For these quarters we substitute the value of zero for generating cumulative political innovations. Given the lags involved in the creation of the independent variables, the estimation equation is based on a set of observations that do not start until 1953:3.

¹⁶ These estimates are from the “one-step” procedure.

FIGURE 2. Gallup Macropartisanship, 1952–96

and

$$M_t^{G*} = 64.17 + 0.169CumE_t + 0.126CumP_t,$$

$$\text{St. Err.} = (1.41) \quad (0.036) \quad (0.029)$$

$$\text{Adj. } R^2 = 0.168; \text{SEE} = 1.712; N = 175.$$

We see that c_E and c_P are decisively nonzero (a joint test produces $p = 0.00000$). The equilibrium M_t^* is a dynamic function of the political and economic environment. Furthermore, if we add administration dummy variables, they neither are statistically significant nor affect the other coefficients in an appreciable way. In short, by explicitly modeling the enduring component of macropartisanship in terms of its underlying cumulative economic and political causes, we account for the historical “effects” otherwise represented by administration dummies and resolve the empirical dispute raised by Green et al. More important, we affirm that the crucial part of macropartisanship—its equilibrium condition—is driven by political and economic information.

More is revealed in equation 4 than the likely existence of a moving equilibrium. We observe from the $(M_{t-1} - M_{t-1}^*)$ coefficient that in the absence of M_t^* change, macropartisanship moves toward its equilibrium value to fill about 20% of the gap per quarter. We also observe a distinctive dynamic response of macropartisanship to politics compared to economics. Political shocks (P_t) produce an immediate reaction in macropartisanship of 0.111 points per unit shift. Thus, when the equilibrium shift is in the form of a changing political input, we obtain nearly the full movement toward the new equilibrium (0.111 of 0.126 points). For economics, in contrast, a one-point innovation in E_t yields only an 0.055 immediate response, which is only one-third of the

way toward the new equilibrium (0.169 points higher than before). In subsequent periods, both deviations will reequilibrate at a rate of 0.198, but the major movement in the political part will have already occurred. Thus, we see that the political part of equilibrium partisanship reacts almost immediately to exogenous shocks, while the economic part reacts only partially, that is, gradually. This makes sense in that people understand quickly the partisan meaning of political news, but they take longer to appreciate the partisan implications of economic change.¹⁷

Figure 2 graphs observed (Gallup) M_t along with M_t^* equilibrium values. With M_t and M_t^* correlated at 0.77, more than half the variance in M_t is accounted for by M_t^* , the moving long-term equilibrium. It is important to note that the largest part of macropartisanship's range, from its post-Watergate peak to its Gulf War trough, is captured by the fundamentals.¹⁸ Meanwhile, the $(M_t - M_t^*)$ “residuals” reveal a pattern of systematic short-term variation. Most of these short-term surges center around landslide national elections, such as the short-term Democratic

¹⁷ Consistent with macropartisanship's gradual response to economic change, macropartisanship moves only when economic realizations are felt in the pocketbook. This is unlike presidential approval, which responds as economic change is anticipated in the form of expectations (MacKuen et al. 1992). For details, see the Appendix.

¹⁸ We also can observe the M_t^* economic and political components separately over time. The economic component (with a slightly larger variance) has generally favored the Democrats. The political component has more consistently favored the Republicans. The two largest reversals of this Republican trend occurred during Watergate and late in the Bush administration.

surge in 1964 and a short-term Republican surge in 1984.¹⁹

We can repeat the ECM exercise using the CBS/NYT measure available for 1976–96:

$$\Delta M_t^C = 0.019E_t + 0.096P_t - 0.536(M_{t-1}^C - M_{t-1}^{C*}),$$

St. Err. = (0.053) (0.048) (0.098) (5)

and

$$M_t^{C*} = 64.52 + 0.174CumE_t + 0.156CumP_t,$$

St. Err. = (1.83) (0.031) (0.026)

Adj. $R^2 = 0.254$; $SEE = 2.281$; $N = 83$.

For comparison, the Gallup version of the equation for the same time period is:

$$\Delta M_t^G = 0.029E_t + 0.127P_t - 0.294(M_{t-1}^G - M_{t-1}^{G*}),$$

St. Err. = (0.039) (0.035) (0.070) (6)

and

$$M_t^{G*} = 64.29 + 0.221CumE_t + 0.143CumP_t,$$

St. Err. = (2.50) (0.044) (0.035)

Adj. $R^2 = 0.265$; $SEE = 1.168$; $N = 83$.

Figure 3 compares the tracking of the Gallup and CBS/NYT series as a function of their M_t^* predictions. Even though the latter series looks noisier (due to its inherently greater measurement error), on average it is

¹⁹ This transient component is exactly that envisioned by Converse (1976). Much (but not all) of the evident partisan fluctuation before elections that seems to presage the election outcome is merely temporary.

just as adequately predicted by M_t^* . The apparent differences in the two series are largely a matter of statistical illusion.²⁰ The two measures of M_t^* correlate at .99 with each other and at .87 with the two observed M_t series, while the two M_t measures correlate at .91 with each other.

There can be little doubt that the forces driving long-term change in macropartisanship are largely the same forces driving consumer sentiment and approval. The proof is in the predictive accuracy. Table 2 compares the ability to predict future values of macropartisanship from current realizations (M_t) and the current equilibrium (M_t^*) of macropartisanship, for 1976–96. The coefficients represent the OLS coefficients for M_t and M_t^* predicting future macropartisanship at various leads. To predict future Gallup realizations as immediate as three quarters ahead, the current equilibrium value provides more information than current realizations. For predicting five or more quarters ahead, current realizations are not even statistically significant when the current equilibrium value is controlled. For predicting six quarters ahead, current macropartisanship has the wrong sign. For the CBS/NYT series, which Green et al. claim is so unresponsive to economic and political inputs, the predictive dominance of M_t^* is even stronger. For predicting one quarter ahead, M_t^C and M_t^{C*} perform about equally. For longer leads (even a mere two quarters), M_t^{C*} predicts better than M_t^C . It is more important to know the fundamentals represented by cumulative innovations in consumer sentiment and approval than to know the current value of macropartisanship. The equilibrium value represents the fundamentals; any current deviation from this value will be temporary. Moreover, the

²⁰ Since the CBS/NYT series reequilibrates faster than the Gallup series, a case can be made that the Gallup series (with its “in politics today” wording) is more affected by short-term forces unrelated to M_t^* . The crucial point is that the two series respond identically to the long-term component of macropartisanship represented by M_t^* .

fundamentals provide stability; correlating at .97 with its lagged values.²¹

The key to understanding the macropartisanship series is its long memory. The response of macropartisanship to new economic and political inputs may be imperceptibly small at the time of occurrence, but it will be long-lasting. For instance, the gain in Democratic macropartisanship during Watergate was far less noticeable than the decline in Nixon's popularity. Yet, as Nixon left the scene, the Democratic gain from Watergate persisted to provide an otherwise inexplicable level of Democratic identification during the Ford and Carter presidencies. Similarly, the more visible long-term Republican gain of the 1980s provided a new base of Republican strength that limited the Democratic recovery starting in the late Bush administration. (See the Appendix for further discussion of M^* as an integrated series.)

In time-series terminology, the long-term or fundamental component of macropartisanship is cointegrated with the cumulative economic and political innovations that influence consumer sentiment and presidential approval. At the same time, a short-term component of macropartisanship (most visible in the Gallup version) represents the transitory response to momentary events. This is very different from the Green et al. model of macropartisanship as a stationary series propelled largely by its own lagged values, with only small transitory effects for consumer sentiment and presidential approval.²²

THE MICRO-MACRO CONNECTION

To say that the fundamental part of macropartisanship derives from the permanent cumulation of economic and political shocks implies that partisan changes for *individuals who comprise the series* are permanent.²³ Here, we address the plausibility of our model, given what we know about individual-level partisanship. Are

the equilibrium values of individuals' party identifications integrated? Is there enough microlevel change in party identification to account for the macrolevel movement?

Actually, plentiful side-evidence supports an integrated individual-level partisanship. For instance, it is established lore that individuals become more partisan with time (Converse 1976). The growth of the variance of individual partisanship with age implies that individual partisanship is an integrated rather than stationary series. We can also cite the distinctively Republican partisanship of the pre-Depression generation, famous for its long memory, even as this older generation approaches extinction.²⁴

Much of what we know about the stability of party identification at the individual level is due to the sophisticated statistical analysis by Green and Palmquist (1990, 1994) themselves. Using Wiley-Wiley methodology (Wiley and Wiley 1970), they estimate that most of the observed change in the survey responses to the party identification question is actually error, while "true" party identification is remarkably stable. Corrected for "error," Green and Palmquist's microlevel equation is:

$$PID_{it}^* = \beta PID_{i,t-1}^* + u_{it}, \quad (7)$$

where PID_{it}^* is the "true" value of party identification, and u_{it} is its normally distributed disturbance. The variables are mean-centered to omit the intercept. Using the two NES four-year panel studies, Green and Palmquist's (1994) mean estimate of β is 0.972 for eight quarters, which prorates to 0.997 for one quarter.²⁵

For all practical purposes, Green and Palmquist's (1994) "true" partisanship is unit-root. In our terminology, their "true" partisanship is *equilibrium* partisanship at the microlevel, while their measurement error is a composite of actual survey error plus short-term movement around the respondent's equilibrium partisanship. Just as the long-term component of M_t is integrated, so is the long-term component of individual party identification.

Now we restore the intercept to equation 7:

$$PID_{it}^* = \beta PID_{i,t-1}^* + \alpha_i + u_{it}, \quad (8)$$

where, as we now see, $\beta = 1$. The intercept α_i represents a uniform shock shared by all citizens at time t due to a common reaction to shared events, while u_{it} is the individual variation around α_i due to variation in individual experience and evaluation. At the macrolevel, the u_{it} terms cancel out, so that only national forces matter. The result is that $\alpha_i = \Delta PID_i^*$, $= k\Delta M_i^*$, so that microlevel change and macrolevel

²¹ When the Gallup series is extended to include observations as early as 1957 (the start of Eisenhower's second term), we get nearly as strong a verdict in favor of the forecasting power of M_t^{G*} . This result falters, however, when the first Eisenhower term is included. As Figure 2 shows, the M_t^{G*} versus M_t^{G*} gap is unusually pronounced for 1953–56. The explanation is uncertain and could lie in weaker data (with more missing values) during this period or perhaps omitted variables.

²² Green et al. object to the possibility that macropartisanship could be an integrated variable. For our response, see the Appendix.

²³ Given individual mortality, effects are permanent only for the life of the person experiencing them. How can effects be "permanent" if voters are mortal? The time series can be regarded as an amalgam of parallel time series for different birth cohorts that enter and exit. The "slopes" of these series are parallel random walks with cohort-specific intercepts. Our M_t^* captures the slopes but not the mean intercepts that reflect the electorate's shifting cohort composition. Compared to the response of macropartisanship to political and economic events, cohort replacement makes only a small contribution. We estimate that the loss of the pre-Depression generation may have cost the Republicans a few percentage points from 1952 to 1980, with early departures from the post-Depression generation causing a mild reversal of the arrow in more recent years. Including estimates of the contribution of cohort replacement adds to our prediction of M_t^* without altering our ECM model in any appreciable way.

²⁴ Voters from the pre-Depression generation respond to contemporary stimuli in modern polls, but they remain less Democratic than the post-Depression era generation.

²⁵ To prorate estimates of β for the quarterly time frame, we take β reported over c quarters to the $(1/c)$ power. In addition to the two NES panels with waves two years apart, Green and Palmquist (1994) also present estimates for four additional adult panels involving shorter time intervals. If we estimate β from pooling six separate estimates from six panels, we obtain a sample mean of 1.00, with a range (from panel to panel) of 0.99 to 1.01.

change are now equivalent, except for a constant k to correct for different scales.

This directs us to the crucial puzzle. How can we reconcile the "large" macrolevel movement in macropartisanship (ΔM_t^*) with the relatively "small" amount of microlevel change represented by the variance in u_{it} ? This discrepancy exemplifies the typical illusion of a large change at the macrolevel appearing small at the microlevel. We demonstrate by rescaling ΔM_t^* in party identification units and comparing its variance with the variance in quarterly individual-level movement in equilibrium partisanship, u_{it} . For a plausible result, there should be less variance in the common movement represented by $\alpha_t = k\Delta M_t^*$ than in the individual deviation around this movement represented by u_{it} , since most movement of microlevel partisanship probably depends on idiosyncratic reasons rather than national forces.

Green and Palmquist (1994) provide four estimates of the variance in u_{it} from the four-year NES panels, which we prorate for quarterly time intervals to obtain the estimate of 0.032.²⁶ To compare this variance with that for ΔM_t^* we need the conversion rate k to transform ΔM_t^* into microlevel seven-point-scale units. We can approximate k using the 23 NES surveys, 1952–96, comparing the standard deviation of aggregate party identification on the 1–7 scale with the standard deviation of macropartisanship $[(\%D/\%(D + R))]$ from the same NES surveys. (The two measures correlate at 0.95, reassuring that they measure the same thing.) The ratio of the standard deviations is 24.1:1.²⁷ Using this conversion table to translate ΔM_t^* variance into party identification units, we obtain relative variances of u_{it} and α_t as 0.032 to 0.0017, or a ratio of 19:1.²⁸ Thus, by our estimates, there is far less partisan change due to national conditions than to idiosyncratic factors. The amount of macrolevel movement in partisanship is quite compatible with Green and Palmquist's understanding of microlevel partisanship's stability.

What of Green and Palmquist's (1994) measurement error in observed individual partisanship? Measured at two-year intervals, all short-term variation in individual partisanship around equilibrium values would be statistically indistinguishable from classical measurement error, with its instantaneous decay rate. Aggregated, this short-term change is the observed variation in M_t

– M_t^* . We compare the observed variances of short-term macropartisanship ($M_t - M_t^*$) with Green and Palmquist's (1994) error ($PID_{it} - \bar{PID}_{it}^*$). Using our conversion rule, and comparing the variance of $M_t - M_t^*$ (8.86) with the mean Green-Palmquist (1994) estimate of the error variance (0.599), we obtain a 1:40 ratio of variances. Thus, if only about .025 of Green and Palmquist's "error variance" were induced by national short-term forces, we can readily account for the observed short-term deviations of M_t around M_t^* .

CONCLUSION

Macropartisanship responds to the political and economic forces represented by presidential approval and consumer sentiment. To see this, one must know where to look. An obvious starting point is to investigate the short-term connection between presidential approval and consumer sentiment, on the one hand, and macropartisanship, on the other. But as Green, Palmquist, and Schickler (1998) demonstrate, such a search is only partially fruitful. As we have shown here, macropartisanship incorporates not only the political and economic news of the present but also the cumulation of news from the past. By adopting an "equilibrium" model of *micropartisanship*, we see that the major turns of partisan fortune found in the macropartisanship series can be explained by changes in the economic and political environment. This result, we believe, should be reassuring rather than controversial: Politics does matter. And that confirmation does not require upending current understanding about the stability of microlevel party identification.

APPENDIX

The Error Correction Model and Macropartisanship

The error correction model (ECM) is a standard formulation in which current change has two components: one due to current inputs, and one due to a reequilibration or a return to a sustainable value. In our application, the first part is straightforward: People react to political and economic information. The idea of the second part is that if M_{t-1} were out of equilibrium—for example, if people overreact to good news—then people would move back toward the partisanship that is consistent with their psychological and social environment, hence "error correction."

The classic formulation of this model is by Davidson et al. (1978), and its use is now commonplace (e.g., Bannerjee et al. 1993; Hendry 1995). Beck (1991) provides an instructive discussion of ECMs in political science. The following equations, repeating equations 3 and 3a from the text, illustrate how the dynamics work.

$$\Delta M_t = b_E E_t + b_P P_t - \gamma(M_{t-1} - M_{t-1}^*) + u_t \quad (\text{A-1})$$

and the equilibrium is:

$$M_{t-1}^* = c_0 + c_E \text{Cum}E_{t-1} + c_P \text{Cum}P_{t-1} \quad (\text{A-1a})$$

If $b_P = c_P$, for example, the immediate adjustment in M_t due to P_t would exactly equal the new long-run equilibrium M_t^* due to P_t , so that the path of M_t and M_t^* would correspond.

²⁶ Given $\beta = 1$, the reported disturbance variance of u_{it} can be converted to quarterly intervals by dividing the reported variance of u_{it} by the number of quarters between waves.

²⁷ That is, a change of 24 percentage points in macropartisanship is required for the party identification mean to move one full unit on the seven-point scale.

²⁸ This calculation assumes the Gallup version, M_t^G . Another interpretation is as follows. Suppose we could follow typical citizens over 44 years, measuring their true (equilibrium) partisanship over this span and at the same time represent the long-term component of macropartisanship in 7-point-scale units over the same span. The individual citizen's equilibrium partisanship would display 20 (19 + 1) times the variance of M_t^* . In 1–7 scale units, movement in macropartisanship has moved only in the range between "pure-Independent" and "Independent, leaning Democrat" (or less than one point) since 1953.

If the immediate effects were substantially higher than the long-run implications, $b_P > c_P$, public overreaction to political news, the public would then readjust to the more modest change in equilibrium partisanship. Finally, if the immediate influence is only a fraction of the long-run implication, $b_P < c_P$, then we have evidence for a partial adjustment to the new dynamic equilibrium. The short-run dynamics are a function both of the ratio b_P/c_P (which is the proportion of the equilibrium effect felt immediately) and of the "return to equilibrium" parameter γ , which shows the proportion of the remaining disequilibrium ($M_t - M_t^*$) is adjusted away each quarter.

If c_E and c_P are zero in equations 3a and A-1a, then the equilibrium M_t^* becomes the constant c_0 , and equations 3 and A-1 reduce to $\Delta M_t = b_E E_t + b_P P_t - d(M_{t-1} - c_0) + u_t$. Were this the case, the change in M_t would be a function of a shock in the political economy and a return to a constant equilibrium, making the political or economic component a transient. If c_E and c_P are nonzero, then the effects of political or economic shocks carry forward in the form of an updating M_t^* .

The estimates for equations 3 and 3a (A-1 and A-1a) are obtained by algebraically substituting the latter into the former and using a nonlinear least squares algorithm. Alternatively, one could use a two-step procedure (Engle and Granger 1987): estimate equation 3a and then substitute the estimated M_{t-1}^* into equation 3, all in OLS. Although there is a lively literature on whether the two-step or one-step procedure is preferable, the matter is moot here. The two-step estimate correlates with our one-step estimate at .998. (We have also estimated the ECMs with MA and AR terms modeling the disturbances; the reequilibration rate estimates diminish slightly, but the rest of the model remains the same.)

Macropartisanship as an Integrated Series

By construction, our cumulative series ($CumE_t = \sum E_s$; $CumP_t = \sum P_s$; $s = 0, 1 \dots t$) represent the strict addition of estimated political and economic shocks. Because the shocks are statistically independent over time, the cumulated series are statistically integrated. $CumE_t$ and $CumP_t$ (and therefore $M_t^{G,*}$ and $M_t^{C,*}$) all easily pass the statistical challenge of the Dickey-Fuller unit root tests; with nonsignificant $|t|$ values of 1.65, 1.57, 1.80, and 2.31, respectively, the null hypothesis of a random walk cannot be rejected for any of these variables. Dickey-Fuller tests on the residuals ($M_t^{G,*} - M_t^{G,*}$) and ($M_t^{C,*} - M_t^{C,*}$) show $|t|$ values of 4.44 and 4.36, respectively, which are significant beyond the .01 level. Thus, standard diagnostic tests reassure that M^* is unit-root with stationary residuals.

The Alternative of Stationarity. Of course, to construct integrated series from political and economic shocks is not by itself sufficient evidence of the correct specification for the explanation of macropartisanship. An alternative construction would be stationary series where effects decay geometrically ($CumE_t = \sum E_s \lambda^{t-s+1}$; $CumP_t = \sum P_s \lambda^{t-s+1}$) according to a λ parameter between 0 and 1. In effect, we chose $\lambda = 1.00$. Other possibilities, even in the $\lambda = .99$ range, produce lesser correlations between predicted and actual M_t . For this test, we search for the value of λ that maximizes the R^2 predicting M_t from the λ -specific $CumE$ and $CumP$ measures. We start the cumulations in 1953 and use them to predict M_t for 1976–96. Actually, the λ that maximizes the R^2 is 1.002 for Gallup and 1.006 for CBS/NYT.

Thus, we model macropartisanship's equilibrium as a

random walk and observe that empirically this model appears to defeat all alternatives. Still, our analysis does not depend on the knife-edge assumption that the autoregressive parameter is precisely 1.0000. If in truth M^* is merely "near integrated" (see Banerjee et al. 1993; DeBoef and Granato 1997) then the implications would be no different for practical politics.

The Plausibility of Integration. Green et al. reject as fundamentally implausible the possibility that a bounded series such as macropartisanship could be integrated or unit-root. Their objection is that a random walk implies an explosive variance and a run to the boundary conditions (0% or 100%). In theory, this objection carries weight; in practice the concern is misplaced.

First, macropartisanship is an unbounded variable that is indexed as a bounded percentage only due to measurement limitations. The concept itself (the electorate's mean relative attraction for the Republican or Democratic Party) is unbounded. For comparison, consider the plausible argument that the stock market is unit-root. If we were forced to measure its performance as the percentage of stocks above some arbitrary value-per-unit threshold, then the truth of the statistical properties of the underlying variable would remain unchanged. In any case, we could make measured macropartisanship unbounded by the simple expedient of recalibrating it by the logit transformation. Such a maneuver is unnecessary for the observed data that range from about 50% to 70% Democratic. M_t and its logit transformation $[\log(M_t/(1 - M_t))]$ correlate at 0.9998 for the actual M_t observations.

Second, M_t^* avoids the calamity of a run to the 0% and 100% boundaries because of its slow speed of movement. In theory, the net change in a unit-root variable will have zero mean with a variance equal to $m \text{Var}(u_t)$, where m is the number of periods and u_t is the change over interval t . The variance in ΔM_t^* is a shade under 1.0, so the expected variance over m quarters is about equal to the number of quarters. For instance, following a century of change, the expected variance is about 400, and the expected standard deviation is about 20. With a standard deviation of 20, half the cases are within 16 points of the mean. Thus, the median absolute value of ΔM_t^* over several runs of 100 years is a mere 16 percentage points.

Because the bounded variable works well enough and because we want to keep the measure easily interpretable ("percentage Democratic" rather than "log of the odds that a partisan is a Democrat"), we chose to follow convention and use percentages, even though we expect an integrated behavioral process.

Recursive Residuals

One interpretation of the innovations in approval and economic sentiment is that these represent the degree of positive/negative surprise conditional upon the lagged levels of the variables. To estimate these innovations, we merely regress the current value on the previous value and take the residuals, with the intent that these represent actual surprises. A plausible alternative is to generate the "recursive" residuals. In that case, the "surprise" is estimated for every time point using only the historical data available up to that time, as if the public could perform these regressions using history when they form their judgments.

The obvious attraction of recursive residuals is that people know history but not the future; for instance, people living in 1956 could not have known the course of events for the next 40 years and thus could not have used those data to estimate persistence functions. It is awkward to assume, however, that everyone's historical monitoring began precisely at the time

when our statistical monitoring began, in 1953. In defense of our use of regular residuals we assume that citizens early in our time span used pre-1953 information to estimate the persistence functions and that these estimates are similar to those using later information as well.

If the persistence function changes over time, then there may be an advantage to using the recursive residuals. If the persistence function is relatively stable, however, then this advantage disappears. Furthermore, the recursive residuals approach produces poor estimates at the beginning of the series because the data are too slim for the task.

We compared estimates of our model using both methods. For the recursive residuals model we follow the exact same procedures as we did for the "simple residuals" estimates of the innovations in economic sentiment and political approval, this time substituting the recursive residuals for the simple residuals. In the end, the two procedures produce statistically indistinguishable estimates.

Decomposing Economic Shocks

Our main analysis shows equilibrium macropartisanship as a function of cumulated economic and political shocks, where the economic shocks are drawn from the Michigan Index of Consumer Sentiment (MICS). Although the central question about economics has been framed as whether consumer sentiment matters, we can probe further to ask which ingredients of the index actually stir mass partisanship. If the question is which ingredient affects presidential approval, the answer is business expectations (MacKuen et al. 1992). The effect on macropartisanship is different. Consistent with its long-term character, macropartisanship's economic response is to collective pocketbook realizations.

To see this, from MICS we extract the separate components of pocketbook realizations (whether family fortunes improved over the past year) and long-term business expectations (the five-year forecast of business conditions). Then, we repeat our ECM exercise with *two* economic components plus the political component (approval unexplained by economics). With two economic components (R_t = shocks to personal retrospections; F_t = shocks to business expectations; and P_t redefined as presidential approval not accounted for by the pair of economic series), we obtain:

$$\Delta M_t^G = 0.031R_t + 0.018F_t + 0.115P_t - 0.271(M_{t-1} - M_{t-1}^*)$$

$$\text{St. Err.} = (0.024) \quad (0.019) \quad (0.028) \quad (0.053)$$

(A-2)

and

$$M_t^{G*} = 61.89 + 0.119\text{Cum}R_t - 0.017\text{Cum}F_t + 0.113\text{Cum}P_t$$

$$\text{St. Err.} = (1.50) \quad (0.024) \quad (0.025) \quad (0.020)$$

(A-2a)

$$\text{Adj. } R^2 = 0.222; \text{SEE} = 1.693; N = 174.$$

The result is decisive. M^* is driven by aggregate pocketbook considerations and the political component of approval but not by business expectations. Partisan self-identification, quite unlike approval of a president, is a matter of personal experience rather than informed speculation. Thus, while economic expectations can affect a president's popularity, any long-term effect on macropartisanship depends on whether the expectations are followed by their predicted realizations.

For the presidential party's economic policies to alter the electorate's collective partisan memory, anticipation is not enough. The effects must be felt by the voters.

The Puzzling Case of Christianity and Republicanism: A Comment on Black

CARY J. NEDERMAN *University of Arizona*

Antony Black argues that Christian republicanism was one of the discourses at work in framing the history of Western republican thought. But he neglects to confront the theoretically unique character of the Christian approach to republican institutions. First, Christian republicanism derived from more general beliefs about the divinely ordained organic structure of the universe. Second, it evinced no necessary hostility toward monarchic rule; indeed, quite to the contrary, its cosmological premise of organic hierarchy supported the office of the king (whether papal or secular). Once these elements of Christian republicanism are supplied, the medieval contribution to the history of republican ideas takes on a complexion very different from that described by Black.

Antony Black (1997) has drawn attention to a major lacuna in the present literature on the history of republican thought: its failure to take account of the Christian contribution to the development of Western republicanism. By viewing republicanism as a purely secular phenomenon, Pocock (1975), Skinner (1978), and others (for example, Rahe 1992) assume the equation of the Christian tradition of politics with monarchical absolutism, systematically ignoring the fact that republican practices as well as theories were central to the development of Christianity. Black thus adds a crucial dimension to the study of the development of republicanism.

Black has not, however, achieved this considerable accomplishment without introducing some new and significant confusions into the discussion. Specifically, I wish to suggest two difficulties in Black's presentation of the Christian tradition of republicanism. First, he continues to rely upon a primarily secular reading of medieval political thought, one which filters out precisely those elements of Christian cosmology and theology that distinguish the republicanism of the Latin Middle Ages from either its classical or modern instantiations. There is more at stake than meets the eye in Black's apparently wry remark that he "will not attempt to define *Christianity*" (1997, 647), since reference to the distinctly *Christian* character of "Christian republicanism" is precisely what his account lacks. Second, by positing an ideal typology of republicanism, he imposes a single vision of a republican tradition that was (and is) diverse and multiplicitous. This leads, in particular, to an anachronistic opposition between republic and monarchy to which many "republicans" of medieval Europe would not subscribe. As Janet Coleman has observed, Latin Christian thought was characterized by a discernible "lack of a neat and oppositional distinction between *regnum* and *respublica*" (1997, 217; see 215–7).

In support of these claims, I sketch the outlines of a form of Christian republicanism typical of the Latin Middle Ages: one imbued with the belief-system of

Christianity and by no means hostile to the principle of monarchy. To defend this view of Christian republicanism fully would, of course, require a magisterial examination of the full range of medieval political writings. In the present context, I can only illustrate my understanding of Christian republicanism anecdotally, by brief examination of the ideas of two major contributors to late medieval political theory: Jean Gerson and Nicholas of Cusa. My choice of these two authors is by no means arbitrary, however. Both figured centrally in the conciliar movement within ecclesiology that Black (1997, 651) considers to be "the strongest evidence for convergence between republicanism and Christianity." A survey of these thinkers sustains the validity of Black's general thesis that the history of republicanism cannot be told without reference to Christianity, while also demonstrating that this claim requires the narration of a more complicated and less Whiggish process than he permits.

CHRISTIAN REPUBLICANISM

The key to medieval republicanism, I maintain, is a theologically informed conception of social and political institutions as organic unities: head and members are interdependent and reciprocally interrelated segments of a living body, characterized by hierarchy but also by inclusiveness and mutual respect. The *constitutio* of the medieval political organism was, metaphorically, a matter of physiological health. Of course, organic conceptions of political community enjoyed a history prior to Christian times and were also attractive to political thinkers working within non-Christian religions, such as Islam. The medieval European reliance upon organic discourse and imagery is distinctively characterized by its embeddedness in a broader Christian cosmology, a conception of the universe as an ordered and living whole composed of microcosm and macrocosm—not so much a "chain of being" as an animated but differentiated totality. According to a line of Christian thought that runs back to the church Fathers, God created the universe as a unity, composed of many different parts, each of which is itself an organic unit that both partakes of the greater whole and has a distinct purpose within the larger scheme.

The author thanks Dr. Simone Zurbuchen and Professor Donalee Dox for helpful comments on this essay.

In a 595 letter, Pope Gregory the Great stated:

The provision of divine dispensation established that the ranks and diverse orders are distinct, so that when the lesser ones show reverence to the greater ones and the greater ones use love towards lesser ones, one combination of love is made out of diversity and the administration of each office is properly carried out. For the whole could not exist in any way if the great order of this difference did not serve it. But since creatures cannot be governed or live in one and the same equality, . . . it is clear that they are not equal but differ one from the other, as you know, in power and in order. If this distinction is known to exist among those who are without sin, what man will resist submitting willingly to this same dispensation (cited in Constable 1995, 271)?

Within each organic unit, as within the universe as a whole, there is higher and lower, superior and inferior. Yet, this hierarchical ordering does not exclude the lesser members of the body from a proper and worthwhile role within the whole.

The principal idea here is reciprocity, that is, mutual support and respect among the various parts of the whole necessary for the common good. This implies, in turn, the need for the active inclusion of all members for the sake of the welfare of the whole. Each segment makes its own unique contribution; the organism cannot survive without the coordination and cooperation of every function. The twelfth-century author John of Salisbury captured this implication of Christian cosmology in a letter to his friend, Peter of Celle:

Everything consists in mutual aid, and heavy things are reciprocally (*vicissim*) intermingled with light things, and indeed in this way things always proceed, because the same spirit of unanimity within things nurtures the concordance of things dissident and the dissidence of things concordant, and disposes the parts of the cosmos (*mundani*) as though the members of a body, so that they may be in accord reciprocally for the ministering of each to the other. Thus it is in the human body that the members faithfully serve each other reciprocally and individuals' duties are assigned for the public advantage. Some have more or less of these than others on account of the mass of the body, but all are united by the goal of its health; they have various functions, but if you consider the advantage of health, they contribute to the same totality (*universa*). Yet they are not all coequal, but the inferiors submit to the superiors. For the foot which is planted in the mud by no means aspires to the dignity of the head; but also the head, which is raised up towards the heavens, does not scorn the foot which moves around in the mud (John of Salisbury [1159] 1955, 181–2).

When transferred by analogy to the political realm, these themes coalesce into a coherent republican position: The ruler is restricted in what he can do by the reciprocity built into the body politic; the participation of the other members of the organism in the business of the common welfare both sets limits on the actions of the head—he cannot properly interfere with their unique tasks—and establishes a sort of “check” on the head in cases where it oversteps its appropriate scope of activity (see Nederman 1992, 980–1, 982–3).

Note that organic political thought was not a single, fixed idea.¹ Rather, it is perhaps more accurate to characterize the image of the body politic as a site of intellectual and political struggle among many contending interpretations and interests. Some of its features were taken as given by all parties to the discourse. For instance, it was taken for granted that some ruling part (generally, but not always, the head) was necessary for the body's health; a headless body was doomed to misery and destruction. Likewise, it was incontestable that law was the medium through which the members of the organism cooperated and to which all parts must submit; law formed the muscles and sinews, or perhaps the backbone, of the animate polity. And no one seriously challenged the existence of some good or welfare common to all parts of the body and greater than each of them taken individually.

Yet, even while creating a framework for discussion, the organic model raised a large number of questions that stimulated wide-ranging debates among medieval political theorists. Could the head be corrected or removed if it engaged in conduct detrimental to the health of the body? By whom? In what way(s)? What duties and powers did members retain under ordinary circumstances? How did they coordinate their specialized roles and tasks with one another? These questions were by no means closed or settled in the medieval mind. The body politic provided a matrix within which central issues about the nature of rulership, governance, and community could be addressed in a manner consonant with deeply held cosmological and theological beliefs.

Medieval ecclesiology, no less than secular theory, commonly embraced this organic model of communal life and its organization. The church styled itself the *corpus Christi mysticum*, “the mystical body of Christ”; but although that phrase had conventionally denoted the sacramental powers with which the church was endowed, a change in usage is noticeable around the middle of the twelfth century. As Francis Oakley (following the work of Henry de Lubac) points out, the sacral functions associated with the church came to be denoted by the words *corpus Christi verum*, while “the expression *corpus Christi mysticum* . . . [began] to acquire political and juristic connotations so that by the fourteenth century ‘mystical body’ has become almost a synonym for ‘moral and political body’” (Oakley 1969, 380). One notes significant overlap between the discourses employed by authors discussing ecclesiological and secular affairs: The language associated with the body politic raised essentially the same questions in the context of the governance and organization of the church as it posed in the case of the earthly community (see Kantorowicz 1957, 193–232).

GERSON'S ECCLESIOLOGY

The Parisian theologian Jean Gerson, whose importance Black (1988, 575, 580; 1992, 171–2) has noted,

¹ The best general treatment of medieval organic political thought is Struve 1978.

affords a clear case of the distinctive form of republicanism I have identified. Gerson is best known as an advocate of conciliarism, that is, the doctrine of the supremacy of the General Council in the governance of the church. Gerson's conciliar credentials are well established. He was personally active in promoting a conciliar solution to the Great Schism in the early fifteenth century, and his writings were widely disseminated throughout the period of the councils of Pisa and Constance (see Morrall 1960; Pascoe 1973). Yet, Gerson's conciliarism conforms less to the typology of antimonarchic institutional and civic republicanism offered by Black than to the organic Christian republicanism I describe. As a consequence, Gerson simultaneously subscribes to a conciliar ecclesiology and to a strong defense of papal monarchy.

To understand how Gerson was able to endorse what may seem to us antithetical principles, it is first necessary to grasp his very conception of the nature of government. All legitimate exercise of power, he contends, must be limited according to law. He states flatly that "spiritual [jurisdiction] should be exercised according to canonical laws toward the ultimate end of realizing beatitude," just as "temporal [jurisdiction] should be exercised according to the civil laws" (Gerson [1417] 1965a, 216). This pertains directly to the governance of the church. Spiritual jurisdiction in Gerson's view is placed principally in the hands of the pope, who serves as a judge whose determinations must occur on the basis of law. Specifically, papal jurisdiction is constituted by "the juridical power of excommunication or interdict by denial of ecclesiastical sacraments and the communion of faith to those who rebel against and disobey the church" (p. 218). The pope, in other words, is charged with primary authority for the maintenance of faith and morals among the body of Christian believers to be accomplished by the enforcement of church law.

Gerson's requirement that the papacy must govern in accordance with law does not, however, entail a denial of papal plenitude of power, that is, the independence of the authority of the pope's office from any superior except God. Gerson remarks simply that "the papal plenitude of power was granted by Christ in those things which are supernatural . . . [and] stands supreme" (Gerson [1415b] 1963, 479). This principle is accepted throughout Gerson's writings. In turn, the theoretical basis for the pope's indispensable *plenitudo potestatis* may be located in Gerson's analysis of the nature of ecclesiastical power in general. Gerson ([1417] 1965a, 226) argues that all offices within the church have, formally speaking, been ordained by God. In this sense, the powers pertaining to the pope cannot be curtailed or controlled by any human authority without violating the divine will. Rather,

ecclesiastical power in its plenitude is formally and subjectively in the Roman pontiff alone. . . . The plenitude of ecclesiastical power is the power of order and jurisdiction which was supernaturally given by Christ to Peter, as His direct and first King, for himself and for his successors to the end of time, for the edification of the church militant

toward the achievement of eternal felicity (Gerson [1417] 1965a, 277–8).

It is thereby erroneous to attribute to Gerson the position that "the pope's apparent plenitude of power is in effect conceded to him as a matter of administrative convenience" (Skinner 1978, II, 116). On the contrary, Gerson believes that the papal *plenitudo potestatis* is of divine origin and is absolutely essential for the conduct of the church's main business, namely, the salvation of souls. In no way ought the pope to be construed as ancillary or derivative to the full spiritual life of the church.

Thus far, Gerson may sound to us like an extreme papalist, but he also recognized that the doctrine of *plenitudo potestatis* has perpetuated an exaggerated vision of the pope's office. Consequently, he allows that ecclesiastical power may also be understood to convey two other meanings: a "material" or "respective" sense, related to its assignment "to particular persons by legitimate right"; and a sense connected to the "exercise or execution" of power (Gerson [1417] 1965a, 220). Materially speaking, the pope (or any ecclesiastical officer) must be chosen and consecrated, activities which appropriately inhere in the whole church. Thus, the church as the mystical body of Christian believers retains ultimate authority over the specific occupants of the papal office (p. 223). Analogously, the power of regulating the use to which particular persons put the rights attached to ecclesiastical government is to be found in the corporate church (p. 232). Papal jurisdiction exists not for its own sake, but instead in order to "edify" the church, to serve the common good of salvation (Gerson [1415a] 1962, 300). And should a given pope not aim at this end, the authority pertaining to the papal office is abused rather than rightly used.

In sum, Gerson ([1417] 1965a, 232) believes that "the regulation of the use" of papal power is confined to those circumstances in which "it is liable to be turned into abuse." The church does not control the office; it instead supervises the conduct of the individual incumbent of the papacy. The regulatory role with which the church is endowed arises because of the uncertainties surrounding human moral will: "Since the supreme pontiff . . . is open to sin and may wish to turn his power to the destruction of the church," it is necessary for "abuse of this sort to be repressed, limited and moderated" by the whole church (p. 233).

Yet, the pope whose behavior is appropriate to the office is beyond any scrutiny; he is protected by his *plenitudo potestatis*. The pope can do whatever is demanded for the edification and welfare of the church without any limit or supervision. When the incumbent acts according to the precepts of faith and charity, the papacy must be totally free to exercise and impose its jurisdiction: "We are able to do what we are able to do rightfully" (Gerson [1417] 1965a, 221). Abuses of power are defined only in terms of actions arising from an evil will that places its private interests above the needs of the public. The "limitation" of papal authority can only be applied to the use of the powers by individual occupants, and never to the direct control of

the office itself, which is a matter for divine determination. Gerson's attitude is summarized by his declaration: "*Papa fluit, papatus stabilis est*" ("The pope changes, but the papacy is stable") (Gerson [1409a] 1965b, 132).

Such considerations also inform the relationship between the pope and the General Council. Gerson ([1415b] 1963, 309) argues that just as a pope is only elevated to office when he has been formally elected and consecrated, so he can only be ousted from the papal throne by a public proceeding and final judgment within the context of a General Council. But Gerson also makes it clear that the reason popes are deposed by councils stems from human frailty and imperfection. Insofar as an individual pope may fall into sin, he is susceptible to the judgment of church and council, "to which he is subject in the same manner as one who is capable of erring to what can never err" (Gerson [1409b] 1965c, 140). In other words, because the papal will is exercised by fallible humans, it is "*accidentalis atque mutabilis*" ("contingent and mutable") (p. 137), whereas the will of the General Council is without moral defect and therefore may always be expected to reach the correct decision in matters of papal turpitude. The determinations of the council are effectively the actions of a morally superior and incorruptible body.

The "perfection" of the General Council reflects its status as the sole and incontrovertible voice of the corporate mystical body of the church. When the council speaks, its proclamations do not reflect the private concerns of its membership but the true needs and purposes of the total ecclesiastical corporation. The General Council does not have a will of its own; rather, it expresses the genuine and singular will of the church community. At this juncture we encounter the corporatism that was an ingrained feature of medieval canonistic and conciliar writing. (For a definition and analysis of this corporatism, see Tierney 1955, 106–53; 1982, 19–28.) As a mystical body, the church has only one will and only one set of interests; its common utility is to be found in the defense and dissemination of the orthodox faith and correct morals, a universal and self-consistent doctrine. The church, in sum, is the bearer of "indeviableness" (Gerson [1417] 1965a, 233) with regard to its own goals and ends. Within the ecclesiastical setting, the communal church is the final arbiter of all matters touching upon the beliefs and conduct of the faithful.

In a sense, then, the pope does rule with the consent of the church manifested through its unique representative, the General Council (Gerson [1415b] 1963, 479). Yet, the council hardly functions "politically" at all in the sense a secular republican might understand, since it is under the direct guidance of the Holy Spirit. The church itself has only one genuine interest to be served: the perpetuation of a unified orthodoxy, about which there could be no legitimate difference of opinion. Therefore, the General Council concerns itself solely with matters arising from the identification and enforcement of catholic doctrine, that is, with the truer and higher purpose necessarily shared by all Christians

(Gerson [1415b] 1963, 478–9). In this, the faithful at large were effectively treated as mere subjects rather than full citizens; their actual participation as individual members of the church was not essential or important. The mystical body of the church is not to be confused with an aggregate of its particular members.

NICHOLAS OF CUSA AND THE CHURCH

This vision of Christian republicanism was not unique to Gerson, but rather seems to have been shared generally among conciliarists of the fifteenth century. In the *De Concordantia Catholica* of Nicholas of Cusa,² too, we find doctrines that echo republicanism admixed with Christian theology and acceptance of monarchic rule. Nicholas constructs the edifice of the church upon expressly organic foundations. Citing Jerome and other Fathers to the effect that the church is a concordant body of disparate members, headed by Christ (Nicholas of Cusa 1991, 5–6), Nicholas ties this to a general cosmological observation: "It is most evident that everything existing and living has been created in concord. . . . But every concordance is made up of differences. And the less opposition among the differences, the greater the concordance and the longer the life" (p. 6, translation altered). In turn, the organization of the natural and supernatural worlds offers the proper model for the church:

When the concordance of differences in the whole universe is examined, the wise recognize that there is a wonderful combination in nature, the entire world shares in a mutual spherical interaction, and everything is ordered to a single end. It suffices for the present to know for our investigation that just as all created beings . . . are preserved in union and concordance with their natural originating source, so our church, which is our topic of discussion, is made up of rational spirits and human beings who are united with Christ, although not in the same way, but in gradations (Nicholas of Cusa 1991, 9–10, translation altered).

The church partakes, as a mystical body, of the same ordering principles as the rest of the universe, according to Nicholas. Therefore, to understand these principles is to grasp the appropriate arrangement and interrelation of the parts of the church.

Specifically, Nicholas concludes from his organic model that no single member of the church may represent fully the powers inhering in the body as a totality. Hence, neither the pope nor any other individual or group within the church may claim supremacy over the whole. At best, Christ alone, as the true Head of the church, may command with finality; and Christ's presence occurs "virtually" when a body representative of the whole church—namely, the General Council—meets and is imbued with the inspiration of the Holy Spirit (Nicholas of Cusa 191, 118–9, 193–4). Yet, this does not lead Nicholas to deny the primacy of the See of St. Peter or the plenitude of papal power in matters

² While in the following I usually rely upon Sigmund's translation of this work (Nicholas of Cusa 1991), I have occasionally retranslated passages on the basis of the Kallen edition of the Latin text (Nicholas of Cusa 1959–68).

of ecclesiastical leadership. Indeed, he attacks Marsiglio of Padua by name for upholding just such a position (pp. 197, 204). Nicholas acknowledges the presence of superior and inferior, ruling and ruled, in all organic structures. Like other conciliarists, he regards the papacy to be of divine origin and thus to be a necessary and permanent feature of the mystical body. Indeed, Nicholas insists on organic grounds that the pope must possess a measure of "coercive" power for the sake of maintaining the church:

Unless an ecclesiastical ruler has some coercive power—although not that lordship by which [secular] rulers hold sway—unity cannot be preserved. For it is necessary that the rotten member and foot should be cut off and the eye that scandalizes torn out if the health of the body of the church is to be preserved (Nicholas of Cusa 1991, 201, translation altered).

Ordinarily, responsibility for securing such health pertains to the pope; acting to achieve the unity of the faith is one of the central duties assigned to the Roman bishop by divine ordination.

Consequently, no council of the church has the authority to eliminate the papal office or to control the pope when he is engaged in the proper execution of his functions. Indeed, no council would wish to do so, given the papacy's divine ordination and established role in the process of salvation. The real problem arises, instead, when a ruler disorders the body by performing duties other than those attached to his office. As Nicholas (1991, 164, translation altered) expresses the matter, "all the members of the one church and the mystical body of Christ have their specific duties, the exercise of which cannot be impeded without the disturbance of order." The General Council, as the agent of universal ecclesiastical reform, is charged with overseeing these functions and with scrutinizing parts that either abdicate or exceed their proper tasks: "If it were the case that every power governed in accordance with the regulations established by the universal councils, the best possible reform would necessarily follow" (p. 164, translation altered).

This is especially true for the papacy, which exercises superior powers within the order of the church. Nicholas fears that the infection of the leading member of the political organism will readily spread to the rest of the body:

If we know what is proper for each member according to the rules of the ancients, then we may see how the body of the church becomes deformed. For it would not be deformed had not an excess of abuse occurred. And since when the head is ill, the other members suffer, it follows that the salvation of the subjects depends upon the health of the rulers. . . . No greater deformity can, therefore, arise than when one believes that, because of one's great power, anything may be permitted and that person violates the rights of subjects (Nicholas of Cusa 1991, 164, translation altered).

By framing the issue with reference to the organic community, and by conceptualizing the General Council as the only truly "representative" body within the

church, Nicholas proceeds to demonstrate that it falls to the church uniquely to reform the limbs and organs, and especially the papal part, whenever the good order of the whole is threatened. The council is the sole valid embodiment of the welfare of the church, and it alone may determine what and where reform must occur. Nicholas posits the council as infallibly capable of discovering and mandating the true and objective interests of the church as a united entity. Nicholas's republicanism thus depends upon prior acceptance of distinctively Christian principles of theology, and it does not conflict with adherence to the preferability (indeed, necessity) of monarchy. Indeed, this helps explain why Nicholas could uphold conciliarism and yet within a few years defect to the position of extreme papalism.³

CHRISTIAN REPUBLICANISM: PAST AND FUTURE

Black is surely warranted in his conclusion that elements of medieval Christian republicanism did not simply disappear with the Reformation, the scientific revolution, and the other harbingers of modernity. In particular, he seems correct to locate resemblances between "the ecclesiological concepts of inerrancy and unanimity," on the one hand, and "the concept of the general will," on the other (Black 1997, 654). But insofar as the premises of Rousseau's community were manifestly "non-Christian," as Black admits, such connections are perhaps at best superficial. The organic communalism of Christian republicanism required acceptance of theological assumptions that Rousseau certainly rejected, not least conceptions of natural hierarchy and the necessity of monarchic rule. Nor should it be forgotten that Rousseau reviled the system of parliamentary representation that he associated with the "degraded" and "dishonorable" practices of medieval life (Rousseau 1987, 198–9)—an explicit rejection of the line of republicanism that Black traces out. Rousseau's passion for equality, not to mention his secularist orientation, places him at a distance from republicanism as it was conceived and practiced by the conciliarists and other thinkers grounded in medieval Christian doctrine.

Black (1997, 654) merits praise, then, for his reminder that Christianity was one of the discourses at work in framing the history of Western republican thought. Christianity is not inherently more sympathetic to a strictly monarchist than to a republican position. But Black's account seems marred by a desire to construct direct lineages between medieval Christian approaches to republican institutions and modern doctrines of republicanism. This leads to the neglect of some features that are most distinctive and constitutive of Christian republicanism: that it derived from more

³ On the wider implications of Nicholas's apparent change of heart, see Fasolt 1991, 318–9. Fasolt stresses that the very distinction between "papalism" and "conciliarism," like the supposed opposition between clusters of other "isms" (e.g., "constitutionalism" and "absolutism," "republicanism" and "monarchism"), results from an anachronistic application of these categories to the Middle Ages.

general beliefs about the divinely ordained organic structure of the universe; and that this cosmological premise of organic hierarchy was by no means antithetical to the office of the king (whether papal or secular). Once these elements are supplied, the medieval contribution to the history of republican ideas takes on a complexion very different from that described by Black.

Specifically, it becomes possible to propose an alternative "ideal type" of republicanism more consonant with the main (although by no means exclusive) intellectual currents of the Christian Middle Ages, founded on a set of principles relatively detached from modern debate (à la Rousseau). Such republicanism, exemplified by the writings of Jean Gerson and Nicholas of Cusa, incorporates (1) moral-theological rather than formal-institutional limitations on the *person* of the ruler who exercises political power and (2) accountability of both government and citizens to a corporate or spiritual authority rather than to an actual community composed of free and equal individuals. Both of these medieval doctrines were gradually eroded and replaced in modern Europe by principles owing more to secularized patterns of thought. And, as a consequence, quintessentially medieval Christian republicanism gave way to its modern counterpart: a republican vision that indeed accords more directly with the typology constructed by Black.

Christianity and Republicanism: A Response to Nederman

ANTONY BLACK *University of Dundee*

In reply to Nederman I argue that in the Middle Ages monarchy and republicanism were not mutually exclusive, and that hierarchy and organicism were not specifically Christian ideas, and should not, therefore, be seen as the Christian element in republican thought. One should not assume that Christianity or any other historical ideology has an essential core of unchanging characteristics.

In my article on Christianity and republicanism (Black 1997), I argued that there were a significant number of de facto historical conjunctions between Christianity and republicanism throughout history, not only in the Middle Ages. I concluded that Christianity was not, as has been widely implied or assumed, inherently monarchical. Cary Nederman's argument is confined to the Middle Ages. He argues that there was "Christian republicanism" then, but that I failed correctly to identify its character, namely, its basis in the organic simile and its continued adherence to the principle of monarchy.

The evidence Nederman cites is drawn from conciliarist thought and in particular Gerson and Cusa. One cannot generalize on the basis of one late school of thought and two very unusual thinkers. To make his case, he would have to look at a much wider range of thinkers and milieux, including the civic and communal milieux. Such further evidence might have falsified or supported him, but without it his thesis is unsustainable.

Nederman's article does, however, raise important questions. He argues that medieval Christian thought was preponderantly monarchical. I would respond that in the period from about 300 to 1500 republican ideas in Europe did indeed develop within and as part of a monarchical and hierarchical culture. For example, Florence was devoutly propapal; Bartolus accepted the general overlordship of the emperor (Canning 1987, 71–90).

But we have to identify correctly what people meant by *monarchia*. To medieval thinkers it did not mean absolute monarchy but rule by one person: It was necessary to have one person in charge of the government. That conception did not rule out a great deal of what we today call democracy; it could mean the equivalent of presidential or prime-ministerial government (France, Britain). Thus, Thomas Aquinas wrote that the best constitution is one in which one person is put in charge on account of his virtue, others rule under him, and nevertheless "the government belongs to all, because these can be chosen (*eliguntur*, elected) from all" (D'Entrèves 1954, 148–9).

The monarch could be elected to serve for life, for a fixed period, or along with dynastic successors. Though the hereditary principle was widely practiced, it was seldom defended (Black 1992, 147–8). Kings had originally, it was said, been chosen by the people (John of

Paris 1971, chapter 10, 19). The two most extensive monarchs, pope and emperor, were elected for life. It was generally agreed that monarchy was the best form of government because it mirrored God's regime in the universe and because experience showed that it promotes order. But nearly all theorists held that the best form of monarchy was not absolute but mixed, that is, with an aristocratic element (counsel and consent from feudal peers) and an element of *politeia* or, in today's language, democracy (the Commons, towns, third estate) (Blythe 1992). Everyone insisted that a monarch must abide by the laws and rule in accordance with them, except when extraordinary circumstances justified extralegal "equity" (*epieikeia*). Some argued s/he should be punished for not doing so. Monarchs were quite liable to be threatened by resistance and to be deposed, a practice defended by many political theorists (Burns 1998, 407–8, 493–511). Monarchical government was nothing like as stable as the popular image, from which Nederman does not dissent, suggests.

This means that some regimes described by medieval and Renaissance people as monarchical might be described as republican today; examples are the Serenissima Venice, with its lifelong doge, and the Florentine Republic, under which Machiavelli served and which he subsequently upheld as a good example, with Soderini as lifelong gonfalonier. The historical difference between constitutional monarchy and a republic is often semantic. (Later, even the American republic opted for one president rather than two consuls.) This point actually supports Nederman's argument, because the main witnesses he calls as Christian contributors to republicanism are the two most eminent theorists of constitutional monarchy, Gerson and Cusa.

Another important issue is raised by Nederman. While not disagreeing that there was a Christian contribution to republican thought, he believes this principally to have consisted in the concepts of hierarchy, harmony, and the organic simile. On hierarchy he is mistaken in two ways. First, he imagines it to have been a specifically Christian concept. It was taken over by Christianity, most famously in the sixth century by the neoplatonic theologian Pseudo-Denis, and subsequently applied promiscuously to political and ecclesiastical regimes. But its roots, especially as a political idea, lay deep in antiquity, for example with Iranian thinkers and in Plato's three classes. In contrast to Duby's (1980) findings on the early Middle Ages, these "three orders" are hardly even mentioned from the mid-thirteenth century onward. This contrasts with the world of Islam, where a theory of four social orders

(taken over from Iran) was prevalent from the ninth till the eighteenth century. Second, Nederman does not succeed in proving a connection between Gerson's and Cusa's addiction to hierarchy and the republican elements in their thought. It seems to me there is no such connection and that hierarchy did not contribute to constitutionalism or republicanism.

The ideal of social harmony certainly did contribute, but it also was hardly a specifically Christian idea. Christians adopted it early and have continued to preach it in various forms ever since, but it was Plato who first described the relationship between the state's parts as like a musical harmony (*Republic* IV.44.313). Generally speaking, harmony was a way of saying mutual respect and affection.

I suspect that Nederman has been misled by the fact that both hierarchy and harmony were discussed in the context of the organic simile. He argues that I failed to take account of the prominence of this. Does this constitute, as he argues, the medieval link between republicanism and Christianity? One obviously cannot disagree as to its importance in medieval thought generally (Black 1992, 15–18) and in theories of constitutional monarchy in particular. One reason for its popularity was that (like monarchy) it could mean different things to different people. It was used sometimes to justify the authority of the "head," sometimes to justify the necessity of collaboration among *all* "members." In the latter sense, it became one of the main justifications for representative assemblies and their powers of legislating, controlling taxation, and supervising aspects of government, precisely because these assemblies mirrored in a visible microcosm the entire society and could act "as one body" (Burns 1988, 482, 498–512; Kantorowicz 1957). And, since the *whole* of society could so assemble, it was argued by conciliarists and, later, parliamentarians, that the representative assembly has more authority than the monarch acting alone, just as the whole is greater than any of its parts (Black 1979; Oakley 1962).

But the organic simile was not, once again, a specifically Christian idea. It went back, for example, to the resolution of the conflict between the Roman plebs and patriciate in the fifth century BCE. Its principal formulator in political philosophy was, again, Plato; the comparison between the soul (*psyche*) and the state (*polis*) plays a crucial role in the argument of the *Republic*. It was, to be sure, then enshrined in the New Testament by St. Paul (Rom. 12:4–8; I Cor. 12:12–14, 18–21; Eph. 4:12, 16) and subsequently played an especially prominent role in Christian social thought. (For some reason it does not appear at all in Islamic thought.) As for its contribution to republican thinking, it was prominent in theories of representative government, but it was also used to justify more absolute forms of monarchy.

There is, finally, no reason for seeing connections between earlier republicanism with its theological affiliations and Rousseau as merely "superficial" (Nederman 1998, 917) on account of Rousseau's rejection of certain (not all) Christian doctrines and medieval hierarchical ideas. One can be profoundly influenced

on some points by people with whom one profoundly disagrees on others.

Behind these specific points, one must recall that Christianity did not start out with an explicit *political* agenda. It tended to take on its political coloring from its environment: Roman imperialism, modern social democracy. Such permeability was evident early, when the church Fathers adopted Stoic and neoplatonic ideas, including the notion of natural justice, and the view that ranks, government, private property, and slavery are artificial and second-best. My conclusion is that Christianity was as open to a republican interpretation, as in Savonarola (Skinner 1978, 147–8) or Milton (Gooch [1898] 1927, 265–70) and an alliance with republicanism as it was to a connection with absolute monarchy. The pious Lutheran and self-educated weaver Clemens Jaeger (c. 1500–61) urged the craftsmen and community (*gemaind*) of Augsburg to maintain their "stable, long-lasting, unaltered constitution, namely the free state and guild government" (Black 1984, 117).

Another example of permeability was evident in the fact that Cicero provided, after the Bible, the most popular moral text (*De Officiis*) of the Middle Ages and Renaissance (Bolgar 1958, 197–8, 206–8). It so happens that he was the most devout republican ideologue of all time. The view that one should prefer the common to the private good (a standard element in republican teaching because it overrode special claims for a privileged individual or family) was one example of a *conjunction* between Cicero and Christian morality. It was constantly stressed by Cicero, and it is easily deduced from the Old and New Testament.

The ideological malleability of Christianity is, of course, again evident in the way that it underwrote absolute monarchy in the East under Byzantium and, later, Russia. But even there, modern experience suggests that it was not as inescapably committed to absolute monarchy as, for example, Judaism and Islam have proved to be committed to legal arrangements adopted in their early history.

Christianity, then, was *inherently* neither monarchical nor republican. We must beware of essentialism in the history of religions or philosophies. We should not assume that being a Christian meant the same thing in the second, fifth, thirteenth, and sixteenth century CE. The use of the word *Catholic* has led to the unfounded assumption that the post-Tridentine Roman church had more in common with pre-1517 Latin Christendom than had the Protestant churches. We make the same mistake, for example, if we assume that all Muslims are of the same political orientation.

Nederman makes no reference to the evidence I presented for conjunctions between Christianity and republicanism *before* and *after* the Middle Ages. He does not comment on my argument that at least some specifically biblical teachings were used to defend republican practices, for example, the idea of leadership as service (*ministerium*, whence the ruler—the pope, for example—as *primus minister*) (Black 1970, 38) and the duty to treat others with love (*caritas*). This was sometimes used in favor of putting one's country

(*patria*) before oneself. He has, therefore, not disproved my thesis that a series of de facto historical connections exist between Christianity and republicanism and that we can no more say that Christianity was inherently monarchical than that it was inherently republican.

Correction to "Separation-of-Powers Games in the Positive Theory of Congress and Courts"

JEFFREY A. SEGAL *State University of New York at Stony Brook*

In my article, "Separation-of-Power Games in the Positive Theory of Congress and Courts" (Segal 1997) I compared the theoretical and empirical validity of the separation-of-powers model and the judicial attitudinal model as applied to U.S. Supreme Court decision making. I found that the preferences of the justices often fell inside the set of irreversible decisions, and that even when the preferences fell outside the set, the justices, with the exception of Earl Warren, showed little evidence of constraint. I concluded, consistent with the attitudinal model, that the justices overwhelmingly engaged in rationally sincere behavior.

Tim Groseclose and Sara Schiavoni (1998), whom I thank for their efforts, have alerted me to two errors in my calculation of the set of irreversible decisions. First, I used the formula 2CC-G (where CC = the conference committee and G = the gatekeeper) for calculating indifference points in the constraint set rather than 2G-CC. Second, I implicitly allowed Congress to pass legislation that would be vetoed and could not be overridden. Correcting this error changes the optimal behavior of the conference committee, which will not propose legislation that can be vetoed but cannot be overridden, and the gatekeepers, who must consider the conference committee's actions.

In this note I replicate the study using the corrected data and find first that the sets of irreversible decisions are a bit broader than I had originally found. This means that fewer justices could be constrained by Congress than I had originally concluded. Second,

among the justices who could be constrained, there are fewer cases of significant congressional constraints. In my corrected tables 2 through 9 (numbered as in the original), the number of justices with significant coefficients ($p < .05$, one-tailed) in the proper direction drops from 17 (out of 126) to 12 (out of 102). Nevertheless, I again find support for constraint by Warren, who alone accounts for half of the positive and significant relationships. Finally, the attitudinal model continues to outperform the separation-of-powers model in direct comparisons (see corrected Table 8). I continue to find strong and consistent support for the attitudinal variable, whose coefficient remains significant ($p < .0001$) and consistent (the coefficient ranges from .32 to .33) in all six models. Alternatively, the constraint coefficient is significant in the one and only place where it was significant in the earlier work, the multiple-veto model using the constitutional preference scores. Finally, in as shown in corrected Table 9, I had found no significant coefficients for the median interaction and I still find none.

Given the tremendous similarity in the results, I conclude exactly as I did before: "As for the U.S. Supreme Court, the theoretical evidence combined with the empirical results cast serious doubt on the whether the justices vote other than sincerely with regard to congressional preferences, except on the rarest of occasions. . . . [E]vidence of strategic behavior at other stages of the Court's decisions . . . suggests that the justices can act in a sophisticated fashion *when they need to* do so. But the institutional protections granted the Court mean that with respect to Congress and the presidency, they almost never need to do so" (Segal 1997, 42-3).

The Limits of Rawlsian Justice. By Roberto Alejandro. Baltimore, MD: Johns Hopkins University Press, 1997. 208p. \$39.95.

Juliet A. Williams, *University of California, Santa Barbara*

"Liberalism," declares Roberto Alejandro, "is a cry of fatigued souls inhabiting a worn-out century" (p. 4). In his irreverent introduction to *The Limits of Rawlsian Justice*, Alejandro accuses recent liberal theorists of trying to make complacency comfortable. In his view, liberals aim to justify and even exalt the status quo, with the ultimate hope of discouraging challenges to existing social and economic arrangements. While liberal theorists may seek to quiet citizens, they certainly have galvanized scholars. This is especially true in the case of John Rawls, whose landmark treatise *A Theory of Justice* (1971) continues to evoke reams of response. Even those weary of the endless stream of secondary literature on Rawls will be refreshed by Alejandro's elucidating, engaging, and genuinely original contribution. In *The Limits of Rawlsian Justice*, the author argues for nothing less than a "farewell to Rawlsian justice" (p. 179). To achieve this ambitious goal, Alejandro seeks to show that Rawls's project is "incoherent" and thus fails even when judged on its own terms.

Alejandro develops his case in a series of close encounters with key Rawlsian texts, focusing significant attention on *A Theory of Justice* (1971). In this work, Rawls presented an elaborate justification for the so-called difference principle as a guiding norm in a just regime. Alejandro summarizes the idea this way: "By arranging inequalities to the benefit of the most disadvantaged, society recognizes their moral agency and treats them as ends" (p. 68). Largely on account of the radical potential of this aspect of justice as fairness, Rawls has been widely credited with supplying a principled basis for the redistribution of wealth in the modern welfare state. Alejandro thinks this view is far too generous. He suggests that Rawls's support for the difference principle rests on "prudential calculations" not moral considerations. As far as Alejandro is concerned, the difference principle amounts to little more than "an insurance for the better-off and a kind of political bribe for the most disadvantaged aimed at guaranteeing social cooperation" (p. 65). One may expect Rawlsians to approve of social and economic inequalities which, while significant, do not provoke violent resistance. After arguing that Rawls's commitment to egalitarianism is morally shallow, Alejandro questions the utility of the difference principle as a pay-off for peace. Because Rawls leaves the specific implications of the difference principle open to political debate, it is likely to produce rather than quash just the kind of disagreement and instability Rawls hopes to avoid.

As his argument evolves, Alejandro takes aim at other aspects of the Rawlsian paradigm as well. In a chapter provocatively titled "Rawls's Communitarianism," Alejandro challenges the assumption that as a liberal, Rawls has no serious conception of community. Through an insightful reconstruction of Rawls's original argument, Alejandro shows that Rawls relies on an ideal of community as "a utopia of harmony, cooperation, and a uniform human nature that best expresses itself by following the dictates of justice" (p. 113). In a surprising reversal of Sandel's well-known critique, Alejandro suggests that the problem with the Rawlsian conception of community is not that it assumes selves that are too "thin" to forge meaningful bonds, but

rather that Rawls embraces a too simple conception of human nature, one which assumes that liberal subjects place justice above all other values. Alejandro's intervention breaks the liberal-communitarian stalemate by shifting the terms of the debate, and one can only hope that interested scholars will give his argument the careful consideration it deserves.

In highlighting forgotten aspects of Rawls's theory, Alejandro does not mean to enhance the credibility of the ideal or to generate more interest in it. Quite the contrary. Alejandro repeatedly insists that it is high time to move beyond Rawls. While he officially seeks to discredit Rawls's theory of justice, however, Alejandro's method inadvertently reaffirms its relevance. Alejandro may question the logical integrity of the Rawlsian ideal, but he readily admits a close connection between Rawlsian reasoning and liberal political culture in the United States. In his own analysis, Alejandro moves seamlessly between close readings and cultural criticism. For example, he declares Prozac an "emblem of the liberal culture" and then proceeds to assail Rawls for encouraging the same kind of self-satisfied indifference he imputes to liberal pharmacology (p. 12). At his best, Alejandro forces us to consider whether in a liberal society apathy is the price we must pay for stability. But the resonance of Alejandro's criticisms suggests that the enduring scholarly fascination with Rawls may have less to do with the philosophical rigor of justice as fairness and more to do with Rawls's ability to articulate the unspoken assumptions lurking beneath the surface of politics in a liberal society. If this is the case, then "bidding farewell" to Rawls requires more than revealing the internal flaws of the Rawlsian ideal: It demands a shift in critical attention from theory to society. Disavowing Rawls is a first step but a small one if we do nothing to change the reality that Rawls merely reflects.

Regrettably, Alejandro shies away from this more ambitious enterprise. Instead, he fiercely defends his conscious decision to focus on the narrow question of coherence, insisting that his internal analysis provides sufficient grounds for a rejection of Rawlsianism. Nonetheless, in the end Alejandro exceeds his own mandate. He reveals in Rawls an effort to justify, legitimize, and even "moralize" a status quo which evidently falls short of Alejandro's own ideal. Reflecting on Rawls, Alejandro confesses that "deep inside our moral consciousness an inarticulated something might revolt at the well-intentioned argument that calls for restraint in the face of crass oppression" (pp. 171-2). Alejandro's admission of outrage hardly comes as a surprise, for it is clear from the outset that he is opposed to Rawls's mission, not just disappointed by Rawls's failure to execute it more smoothly. Internal inconsistencies, while serious, do not doom the Rawlsian project. Indeed, Alejandro's effort to identify fatal flaws might be used merely as constructive criticism by a Rawlsian sympathizer. Until Alejandro reveals more fully the grounds of his opposition, we will have to wait for a definitive rejoinder to Rawls.

It would be a shame, however, to let what is missing overshadow the significant contribution that Alejandro does make. This book is one of the very best in the crowded field of scholarship on Rawls. While many have observed that Rawls's project is deeply conservative in its effort to justify rather than transform liberal society, Alejandro offers the most sustained treatment of this important subject to date. *The Limits of Rawlsian Justice* will be appreciated both by those seeking an accessible exposition of Rawls's central ideas and by those interested in the broader political and philosophical significance of Rawlsian liberalism. Of course, the success of this effort suggests a certain irony. Even as Alejandro implores us to move beyond Rawls, his reinterpret-

tation inspires one to return to the old texts once again. So much already has been said about Rawlsianism, but Alejandro's innovative intervention demonstrates that there is still yet more to say.

Utilitarianism, Institutions, and Justice. By James Wood Baily. New York: Oxford University Press, 1997. 203p. \$49.95.

Itai Sened, *Tel Aviv University and Washington University in St. Louis*

Baily starts his argument with the claim that utilitarianism raises two related problems that lead to one paradox. The first is that utilitarianism "requires too much" by imposing impossible costs on some people to alleviate costs to others. The second is that whatever help we may extend, we are unlikely to do much good before we run out of resources. The paradox entailed is that "utilitarianism tells us to make each and every choice such that it leads to the best consequences overall. But an insight made clearer by the development of game theory is that no choice has consequences in isolation, only in conjunction with . . . choices of many other agents" (p. viii). The solution Baily offers may be called institutional utilitarianism: "Both problems and the paradox can be resolved simultaneously. The resolution of the paradox of individual responsibilities is achieved by elaborating an account of institutions as equilibria in complex games" (p. viii).

Chapter 1 discusses some interesting issues surrounding the debate on utilitarianism. An interesting remark is that this philosophical school lends itself better than others to empirical accountability. It should be noted that deontological theories do not show this openness by principle, while pragmatic liberalism and other consequentialist theories, most important welfare economics, are just as open to empirical accountability. Baily's defense of utilitarianism against egalitarian and prioritarian ("Rawlsian") theories of justice is convincing and effective.

Chapter 2 is an effort to draw support from the works of Harsanyi, Rawls, and Hardin (and Hare). The main gain here is a clear exposition of some issues that concern the relationship between *contractualism* and *utilitarianism*.

Chapter 3 is an attempt to study how utilitarians and players the author characterizes as "minimalists" may behave in a prisoners' dilemma type of environment. This is probably the weakest chapter in the book. The author attributes nonorthodox utilities to the players who completely change the nature of the game. With due respect to the substantive argument, I think that readers familiar with the high standards set forth by three decades of systematic research on the prisoners' dilemma in the social sciences will find the treatment of this subject lacking in rigor.

Chapter 4 is a nice discussion of the role of institutions in society. In the end of the chapter the author proposes a selection of a subset v of equilibrium outcomes and the use of a concept k to rank cases by the extent to which there is uncertainty concerning the possibility of interpersonal comparison of utilities. The v selection is not very well motivated. Baily combines arguments from axiomatic social choice theory and noncooperative game theory to motivate this selection. If such a mix is at all acceptable, then more care should have been put into justifying it. As for the k concept, interpersonal comparison of utilities is not an issue of degree. It is an issue of principle. How can anyone decide what types of goods or pleasures are more amenable to interpersonal comparisons of utilities? This is exactly where J.S. Mill failed in his version of *utilitarianism*. Speaking of whom, I was

surprised to find that Mill does not appear in the reference list and, as far as I can recall, is mentioned only once in the entire book.

In the following chapters Baily applies his k and v analytical apparatus. Chapter 5 is an amusing comparison between the "utopian" communist and libertarian "ideal" politics and the imperfect "real" political structures in the eye of a utilitarian. Both chapters 5 and 6 contain discussion of problems of distribution and redistribution. The author struggles to convince the reader that his analytical apparatus helps us understand (or "solve") these issues. Chapter 7 is an attempt to answer the question: What is left of utilitarianism? Unfortunately, the answer the reader gets is: "not much." As the author struggles to prove both the usefulness of his analytical apparatus and the viability of utilitarianism, the argument becomes more vague and less convincing.

Utilitarianism has one simple and elegant recent justification provided by Harsanyi and cited in the text (pp. 38–44). Harsanyi observes that maximizing the welfare of a community, under the restriction of impartiality, entails the maximization of every individual in this community and vice versa. The problem of Harsanyi's argument is the problem with utilitarianism in general, and that is the problem of interpersonal comparison of utilities with which all possible defenses of utilitarianism must deal.

To conclude, Baily tackles an important set of issues in modern political theory. Because utilitarianism relies so heavily on the notion of interpersonal comparison of utilities, any socially acceptable, normative theory must depart from any narrow interpretation of utilitarianism. The book has a nonnegligible value, as it helps clarify some of the more dicey issues in the debate around utilitarianism as a moral social theory. The main contribution of the book is to suggest that institutions and incomplete information may reduce the danger of the "parade of horrors" of which utilitarianism is often accused.

Rethinking Generosity: Critical Theory and the Politics of Caritas. By Romand Coles. Ithaca, NY: Cornell University Press, 1997. Contestations Series. 246p. \$39.95 cloth, \$16.95 paper.

Melissa A. Orlie, *University of Illinois, Urbana-Champaign*

According to Romand Coles, there is an intrinsic relationship between giving and receiving. No doubt your parents told you the same thing. Still, it is unlikely that we recognize what this teaching demands. Our apparent acts of generosity are often less than generous because we fail to recognize our effects upon the others to whom we give. More specifically, we may not see how we seek to master others' difference from us in order to find them worthy of our gift or in the course of giving to them. The chief culprit in this theater of misrecognition is a sovereign conception of the subject. Modern individuals seem especially prone to the delusion that we are makers and masters of ourselves, dependent on neither God nor others for what we most fundamentally need and know. It is this conception of the human person and social life which Coles wants to challenge. But he wants to make this challenge without recourse to divinity and, thus, in the name of a postsecular caritas. What Coles calls receptive generosity allows otherness to appear in its otherness. Through a form of generosity which receives as it gives we may transfigure ourselves as well as others for the better.

Coles begins by demonstrating in some detail why Kant's effort to imagine human beings as at once sovereign and generous proves untenable. Almost every undergraduate

forced to read Kant feels and protests against this untenability. It is another thing, of course, to explain the emotional truth of the protest in the face of a thinker who denies reason access to such resources. According to Coles, sovereign subjectivity's generosity often gives less than it thinks because it does not adequately receive. Indeed, we may unwittingly do harm. He argues, "Kant needs otherness in order to avoid the arbitrariness of a pure self-giving subject, but receptivity appears to confront him with a heteronomy that is equally disruptive of a sovereignty of objective necessity. Kant, then, must construe receptivity and otherness so that they are drained of their disruptive contingency" (p. 27). Such a "pacifying receptivity" is manifest too in an insidious form of liberalism that seeks "to establish its singularly supreme legitimacy on the basis of the array of diversity it claims to have respected and allowed into its order" (p. 27). More often than not, however, these others have been purged of their radical alterity so that they have become what Coles names "otherness-not-otherness" (p. 36). Coles finds some signs of an alternative to such injurious generosity in Kant's *Critique of Judgment*, but his real inspiration is Theodor Adorno.

One might think that Jürgen Habermas's intersubjective theory of communicative action would be the more logical resource since Habermas believes that he overcomes Kant's shortcomings when he altogether jettisons his sovereign subject. Moreover, Habermas thinks that overcoming the philosophy of the subject is exactly what Adorno fails to do. But Coles turns to Adorno precisely to develop an alternative to this predominant form of dialogical ethics. At issue is not only whether we aspire to be sovereign subjects but how we relate to what we cannot readily see, hear, or recognize. Habermas seems oblivious to what is invisible, silent, or outside the communicable, whether nature or human (pp. 159–79). But for Coles, as for many others influenced by poststructuralism, what is not readily communicable is of crucial concern. In my view, this concern is animated, quite simply, by a desire for truth. What exceeds communication reminds us of the truth of our nonsovereignty; it is also intimately related to truth in all its fullness. What is communicable is not untrue, but it does not exhaust truth. For Coles, following Adorno, "the establishment of rational communication—even the ideal of communicability as the centerpiece of our understanding of truth—is already a foreclosure, an ideological constitution of our idea of truth" (p. 121).

I do not know that Adorno offers the most powerful critique of the problems associated with sovereign subjectivity (p. viii) as Coles suggests. Coles does do a great service, however, in reminding us if we had forgotten, or in introducing us if we have never known, of the riches Adorno has to offer. Coles' reading of negative dialectics as a reformulation of generosity is unique. Invoking "an ethical constellation of diverse solicitations that are agonistically juxtaposed" (p. viii), Coles shows how Adorno's texts cultivate receptive generosity where others have found only a totalizing utopia or a performative contradiction (pp. 76–84). Negative dialectics is "an activity of giving and receiving through which concealed suffering is revealed and higher possibilities are evoked and explored" (p. 81). Adorno "employs declarations in a constellation of concepts whose relations of tensions and overlap disrupt the declarative and solicit an active morality of thinking" (p. 82). In this way the truth of a declaration is sustained while its limits are acknowledged. But a careful relation with otherness is as reverential as it is agonistic (p. 168). Adorno's constellations, like Coles' own, seek to cultivate selves "pulled by, and develop[ed] through, the demands for consistency and the demands to resist it" (p. 178). Ultimately, if paradoxically, negative dialectics

serves communication by attending to what is not immediately, if ever, communicable.

Both political scientists and deductively oriented political theorists often wonder at the preoccupation some of us show with what seem to them the insignificant minutia of narratives. Coles' reading of Adorno's writing practices and texts exemplifies what many political theorists of narrative argue: As Kirstie McClure puts it, attending to the narrativity of a text can unsettle and recirculate political meanings. This is not to say that reading a text is itself necessarily a political or ethical action. It is to say that when we read texts with care—receptive to the multivalent meanings they may awaken in us and generous in the transfigurations we offer in our readings of them—we may become capable of actions previously unimaginable. Coles himself exemplifies these hidden political possibilities in his concluding reflections on coalition politics and political economy (pp. 180–219).

Coles desires a postsecular *caritas*, a receptive generosity which need not depend upon God for inspiration. He directly confronts Charles Taylor's challenging claim that "high standards need strong sources" and his worry that our sources are dangerously depleted (*Sources of the Self*, 1989). Coles acknowledges that the ethical generosity he affirms is demanding, but he does not believe that it need be parasitic upon theological convictions it explicitly rejects as Taylor might suggest (pp. 136–7). In this regard, Coles is least persuasive when he seeks to "make a case for" receptive generosity or to articulate it as a "regulative ideal." As he well knows, Taylor worries not that we are without justifications but that our moral resources now only castigate rather than inspire. When asked what inspires us to care for truth rather than untruth in our perceptions of otherness, or to prefer good rather than not good in our relations with it, Coles best reply is that "one adopts this vantage point out of an overwhelming sense that where it is lacking 'life does not live'" (p. 137, quoting Adorno). Finally, Coles can gesture toward the event of inspiration but can neither explain nor guarantee it. In this respect Coles' reading of Adorno's negative dialectics, like the best theology, acknowledges and engages the problem of inspiration while the predominant forms of dialogical ethics seem simply to ignore it. The care Coles exercises in his writing, and the beauty it sometimes achieves, attests to the importance of inspiration as he cultivates it.

Emancipation and Illusion: Rationality and Gender in Habermas's Theory of Modernity. By Marie Fleming. University Park, PA: Penn State University Press, 1997. 243p. \$40.00 cloth, \$17.95 paper.

Robert W. T. Martin, *Hamilton College*

In this insightful and much-needed book, Marie Fleming notes that feminists have done too little to investigate Jürgen Habermas's work, especially his theory of rationality. Apart from a few notable exceptions, feminists have tended to dismiss Habermas's universalist theories, or to critique ancillary elements of this work (in which effort they are spoiled for choice). Fleming instead aims for the very heart of Habermas's body of work, the view of rationality implicit and explicit in his theory of communicative action. Rather than join the chorus of critics denouncing his universalizing imperative, she exposes gender inequality structured into Habermas's philosophy and concludes that his work is not universalist enough.

Ranging as far and as wide as the Habermasian corpus itself, Fleming examines Habermas's forays into debates over just about everything: modernity, epistemology, rationality,

linguistics, discourse ethics, social evolution, art, and the bourgeois public sphere. On each of these topics, Fleming reveals a "pattern" in Habermas's theory whereby he presumes certain gendered roles but ignores the gender dimension. Fleming thereby argues that the problem of gender in Habermas's theory is deeper and more pervasive than other, similarly sympathetic feminist theorists have acknowledged. Rather than merely attack his "system/lifeworld" distinction as does Nancy Fraser, or reject the androcentric universalization principle of his discourse ethics as does Seyla Benhabib, Fleming uncovers Habermas on the one hand making socialization central to his theory of communicative action, yet on the other ignoring the gender inequality both historically and theoretically built into his model. Similarly, his rational reconstruction of historical materialism excludes from the definition of social labor the work females did in the primitive family, yet it also presupposes this labor.

Thus, Habermas's view of communicative action, based as it is on ideas of socialization and social labor, is exposed as essentially flawed. Assessing the implications of this "undertheorizing" of gender, Fleming uncovers how the weaknesses of his rationality theory undermine the formal-pragmatic analysis of the validity basis of speech; the result is that Habermas's universalization theory fails, leaving his morality/ethics distinction—already much criticized—gender-coded and fundamentally weakened. Ultimately, Fleming rightly concludes, we need a new, reconstructed universalist theory that lives up to the promise of inclusion and equality (p. 225).

In writing a book revealing structural gender inequalities in Habermas's work, Fleming is herself battling a number of problematic features built in to any such argument. First, since Habermas has drawn from a dizzying array of disciplines throughout forty prolific years, following him leads Fleming and her readers in myriad directions. This difficulty, when combined with the dense prose typical of Habermasian studies, has the reader doing considerable heavy lifting. Yet, making her argument (and Habermas's) more accessible would almost certainly make it less faithful to the breadth and depth of his work. Fleming prudently stays true to the vast and penetrating nature of his theory and her own critique.

Secondly, given Habermas's "few references to gender" (p. 109), Fleming is forced to make the most out of a handful of passages that Habermas does little to explain. This, of course, is a predicament to which feminists have generally grown accustomed. Fleming's argument, however, seems especially conjectural, littered as it is with suggestions, possible readings, and conclusions that she considers "hard to avoid" (p. 115). Similarly, while her argument admirably draws from throughout Habermas's vast corpus, an entire chapter (chap. 5) revolves around a single, brief example he mentions in passing during an interview.

Although these difficulties may be largely unavoidable, Fleming often aggravates rather than alleviates them. For instance, her argument is made more abstruse than it need be by a tendency to introduce one line of inquiry only to postpone it until some point later in the argument. Furthermore, it is never made clear why she eschews a chronological analysis of the development of Habermas's theory, relegating his *Structural Transformation of the Public Sphere* ([1962] 1989) to the last substantive chapter and leaving opaque the way his "undertheorizing" of gender evolved as his project unfolded. These added complications are especially regrettable because they obscure some interesting and important detective work: Why is it that Habermas, who is clearly sympathetic to many feminist claims, largely dismisses issues of gender equity? Is this simply an oversight, understandable

given the ambitious breadth of his argument, or part of a deeper problem? As Fleming's book ultimately makes clear, it is the latter.

What is less clear is why those who are skeptical of Habermas's universalist approach to rationality have any reason to want to return to it, except Fleming's belief that "feminists generally" are "very much within the philosophical discourse of modernity" (p. 225). I suspect that she is right that we inexorably move within that discourse, but this is unsatisfying given her claims (pp. 27–35) that Derrida is successful in destabilizing the very rationality upon which modernity and its universalizing tendency are based. How exactly will rendering the theory even more universalist make rationality more stable?

Fleming leaves a number of other loose ends, which is perhaps to be expected given that she is introducing a new direction of inquiry. But where, for example, is the sustained analysis of *Between Facts and Norms* ([1992] 1996)? Of course, Habermas's latest volume has only recently been translated; yet Fleming leaves few other stones unturned, at times drawing from early and as-yet untranslated essays. Apart from a few, seemingly ad hoc references to Habermas's all-too-brief comments about feminism in the new book, she ignores it. This is especially problematic since it is in this work that Habermas really attends to the role of the law in his theory of communicative action, and Fleming recognizes that an increased juridification of the lifeworld may be necessary to address issues of equality and inclusion. In particular, despite Habermas's remarks about feminism, one might argue that his new dual perspective on law opens up the possibility of a lifeworld colonized less by a de facto, bureaucratic, systems rationality, and more by validated, legal norms of equal respect.

Fleming's concluding section is largely an appeal to feminists, imploring them to reconsider Habermas's powerful if significantly flawed theory. They should. Indeed, as Fleming notes, a few have. But her critique really poses questions for all those interested in the Habermasian project. We can only hope Fleming and others now turn to answers—answers that lead to a reconstructed, universalist, and more genuinely inclusive theory.

Social Darwinism in European and American Thought, 1860–1945: Nature as Model and Nature as Threat. By Mike Hawkins. New York: Cambridge University Press, 1997. 344p. \$69.95 cloth, \$27.95 paper.

Gary R. Johnson, *Lake Superior State University*

"Social Darwinism" is a moral and political indictment in contemporary discourse. Use of this term is therefore a contested practice. Since virtually no one claims to be a Social Darwinist, the contest is really over how broad a group may be indicted under this epithet. Mike Hawkins's book, *Social Darwinism in European and American Thought, 1860–1945*, is (1) an attempt to expand greatly the size of the group that may be charged under this indictment, and (2) a defense of some who would otherwise be found guilty under the expanded definition of the crime. The overall purpose of Hawkins's book is to condemn as a Social Darwinist anyone who applies an evolutionary perspective to human behavior (except for some confused but otherwise enlightened souls whose political views Hawkins is in sympathy with).

Contrasting his definition with more conventional definitions, Hawkins says that Social Darwinism is not a discrete ideology, but rather a world view based on five evolutionary assumptions. The most crucial of these is that evolutionary

theory applies not only to human bodies but also to human social and psychological attributes. The effect of this definition is to make a Social Darwinist out of anyone who uses evolutionary theory in an effort to understand human behavior.

Hawkins refers to this fifth assumption as "biological determinism," and applies it to any thinker who believes that human biology has *anything* to do with human behavior. Of course, no one believes that human biology is the sole determinant of human behavior. It is this empty cell that could most appropriately be labeled biological determinism, but Hawkins chooses instead to apply this term to anyone who is not a cultural determinist (his own position). Hawkins employs this simplistic biology/culture dichotomy to reconstruct selectively intellectual history following the publication of Darwin's *The Origin of Species*. He begins by arguing that Darwin himself was a Social Darwinist: "It is both perverse and inaccurate to deny his status as a Social Darwinist" (p. 36).

Part II is devoted to "Pioneers," with one chapter each devoted to the emergence of Social Darwinism, and Social Darwinism in France and Germany. These chapters briefly review the Social Darwinism Hawkins says he finds in a variety of mostly nineteenth-century thinkers and seek to show the "janiform quality of Social Darwinism discourse"—that nature is sometimes viewed as model and sometimes as threat (p. 18).

Part III is devoted to selectively chosen "case studies." There are chapters devoted to liberal/radical Darwinism, racism and militarism, eugenics, sex differences and sexism, and Nazism/Fascism. In effect, these chapters provide a defense of the view that applying an evolutionary perspective to human behavior implies support for conservatism, capitalism, racism, militarism, imperialism, eugenicism, sexism, and Nazism.

Hawkins acknowledges that evolutionary approaches have been put to a wide variety of ideological uses. Thus, liberals, socialists, communists, anarchists, pacifists, racial egalitarians, anti-imperialists, anti-eugenicists, and feminists have often been Darwinians. Hawkins says, however, that Darwinism has "discursive boundaries." For that reason, those he considers progressive thinkers either are not really Darwinians—despite what they say—or their theories suffer from "incoherence" or "inconsistency" or "tensions" because of the Darwinian elements. Conservatives, capitalists, militarists, imperialists, racists, eugenicists, patriarchalists, and Nazis, by contrast, may use evolutionary theory coherently in defense of their doctrines.

Knowledgeable readers will be deeply skeptical of these claims. They will notice, for example, some suspicious convenience in the selection and coverage of relevant thinkers. There is no mention, for example, of Karl Kautsky or Michael Bakunin, both of whom were communists and evolutionists. Influential communist anarchist Peter Kropotkin warrants only three pages, and these are mostly an apologia. In contrast, more than nine pages are devoted to an obscure French librarian, Georges Vacher de Lapouge, who tried to use a Darwinian framework as a ground for his virulent racism.

Knowledgeable readers also will be disturbed by the author's distortion of the scholarly record. For example, Hawkins is clearly sympathetic with the political values of Kropotkin. Since he does not want Kropotkin to be tainted as a "Social Darwinist," however, he tells us that Kropotkin's view of the world is really not Darwinism, and that "mutual aid was not, for him, a consequence of natural selection" (p. 179).

These claims are simply untrue. Kropotkin tells us explicitly that his ideas about mutual aid and evolution are "nothing but a further development of the ideas expressed by Darwin himself" (*Mutual Aid*, 1914, p. x). He also makes clear throughout his famous work that cooperation is a product of natural selection. Indeed, he says—in a paragraph preceding one from which Hawkins quotes—"competition is not the rule either in the animal world or in mankind. It is limited among animals to exceptional periods, and *natural selection* finds better fields for its activity. Better conditions are created by the elimination of competition by means of mutual aid and mutual support. In the great struggle for life . . . *natural selection* continually seeks out the ways precisely for avoiding competition as much as possible" (1914, p. 74, emphasis added).

If it is useful to Hawkins's agenda for Kropotkin to be an anti-Darwinian, it is also useful for the twentieth century's worst monster to be a quintessential Darwinian. Thus, Hawkins tells us that Darwinism was a "foundation" for Nazism. Indeed, he says, Nazi "theory and practice were predicated upon the [Social Darwinist] world view to a remarkable degree" (p. 284; emphasis added). Involuntary sterilization, euthanasia, and the Holocaust itself "received their legitimation from the Social Darwinist world view" (p. 280). And by contrast with the liberals, socialists, pacifists, racial egalitarians, and feminists who thought they were Darwinians—but whose theories are "inconsistent" with Darwinism according to Hawkins—Hitler "showed a consistent adherence to the premises of Social Darwinism" (p. 282).

It apparently does not trouble Hawkins that Hitler makes no mention of Darwin or "evolution" in the 688 page of *Mein Kampf*. And there is no indication that Hitler had anything other than an extremely crude understanding of natural selection. Of course, Hitler does rant regularly in *Mein Kampf* about a "struggle for existence," applying this phrase sometimes to his own life, sometimes to individuals, sometimes to nations or peoples, sometimes to races, and sometimes to "mankind" or "the species." On the basis of these passages, we may fairly say that Hitler sometimes used a crude, pseudo-Darwinian framework as a rationalization for his policies. We cannot on this basis, however, say that Hitler was a Darwinian.

Hawkins also uses forms of distortion. Thus, those familiar with social evolutionary thinking in the nineteenth and early twentieth centuries know that the terms "savage" and "barbarian" were used regularly by a wide variety of thinkers. These terms are offensive to contemporary ears. Hawkins takes full advantage of this sensitivity by regularly noting the use of these terms by those whose social and political views he disdains. However, he almost never acknowledges use of these terms by those with whom he is in political sympathy. Thus, Hawkins quotes use of one or both of these terms in his discussions of Walter Bagehot, Cesare Lombroso, Herbert Spencer, William Graham Sumner, Ludwig Gumplowicz, and others. But there is no mention of these terms in Hawkins's discussion of Kropotkin, even though Kropotkin used these terms throughout *Mutual Aid*, including in chapters entitled "Mutual Aid among Savages" and "Mutual Aid among the Barbarians."

The selectivity and the distortions are useful for Hawkins's agenda, but his enterprise also relies upon misrepresentation of evolutionary theory. In introducing his discussion of Kropotkin, for example, he uses "natural selection" to mean head-to-head competition: "The idea that *cooperation* was at least as important as *natural selection* in evolution—especially human evolution—appeared early in the history of Social Darwinism" (p. 177, emphasis added). This misuse is

convenient for his purposes—cooperation can obviously not be the *product* of natural selection if it is the *antithesis* of natural selection. This conceptual sleight of hand—and misuse of evolutionary theory—probably grows out of the moral discomfort Hawkins feels about cooperation at one level being the product of something akin to competition (natural selection) at another level. Kropotkin himself, however, had no trouble with this concept (*Mutual Aid*, 1914, pp. 17–18).

The book's final chapter (which has the moral tone of an exposé), provides an extended caricature of contemporary sociobiology. Using the same kinds of distortion and misrepresentation he uses in earlier chapters, Hawkins says that sociobiology is "a particularly powerful example of Social Darwinism" (p. 292). He acknowledges that contemporary sociobiologists hold a wide variety of political views; however, those who hold morally acceptable views are apparently, like their predecessors, confused. Consistent with this theme, the book's final sentence warns sociobiologists that they cannot claim "innocence" about the implications of their theories.

Social Darwinism in European and American Thought, 1860–1945 is a deeply biased presentation of scientific and intellectual history in the service of a political agenda. The author demonstrates considerable erudition, but it is an erudition contaminated by his ideological commitments. The book is certainly more sophisticated than the website of Humanitarian International, which proclaims that "Social Darwinism is the root cause of all of the world's current problems" (www.geocities.com/Athens/1058). Unfortunately, it is not substantially more credible.

Seeds of Virtue and Knowledge. By Maryanne Cline Horowitz. Princeton, NJ: Princeton University Press, 1998. 373p. \$49.50.

Alan Levine, *American University*

This book has impressive breadth. It traces the use of vegetation as an image for human development through 2,000 years of Western history in numerous cultures and ways of thought, including Hellenic Greece, Christian and Jewish thought from ancient through medieval times, the Renaissance, and early modern times (especially in France—Bodin, Montaigne, and Charron each get separate chapters). The book examines texts primarily, but it also examines other media in which the analogy between culture and horticulture is found, including architecture (Avignon's papal palace), painting, book illumination, and other fine arts. In support of this approach, and uncharacteristic of books reviewed in the *APSR*, *Seeds of Virtue and Knowledge* has pictures, descriptions of which are elegantly woven into the multimedia tale that Horowitz tells. Horowitz discusses her array of topics with an astute knowledge, as this study is the culmination of many years of work. With such a wide scope, her discussion of each topic must necessarily be somewhat abbreviated, although she typically says enough to make her points convincingly.

The book is very informative on the nature and history of Stoic thought, a subject which since the works of Quentin Skinner and Richard Tuck is becoming increasingly popular. Beginning with the Stoic claim that every human being possesses sparks of reason, common notions, "seeds of virtue" and "seeds of knowledge" (hence the title) in his or her soul, Horowitz shows the various ways that this teaching has been interpreted and merged with other vegetative imagery in other intellectual traditions (the "burning bush," "trees of knowledge," etc.) throughout time. Hence, the book is full of arguments in favor of self-cultivation and individual

blossoming, and it locates these arguments in the context of the blossoming of particular cultures (Rome, Florence, Paris). Because it is so comprehensive, the book will cover some material familiar to specialists of the figures and traditions discussed, but it is illuminating in many of the connections it makes and is bound to be full of little nuggets of knowledge for everyone, from a casual reader to the most sophisticated scholar. This reviewer, for example, was intrigued by Horowitz's discussions of the meaning of the word *renasci* (the root word for the Renaissance) as "to grow again" not only as "to be reborn," on early uses of the phrase "human condition" (Pope Innocent III), and the whole genre of *florilgia*. With all these tidbits, the book is suggestive and provocative beyond its immediate claims. There is some confusion about whether the book is simply tracing Stoic imagery through time or rather tracing vegetative images wherever they are found. But in fairness these two possibilities are related and the book does both, tracing how these images are incorporated into and used by other traditions, which may or may not have had pre-existing vegetative imagery of their own.

The book has two goals. Its more moderate, scholarly, goal is that "this book joins others in providing evidence that the idea of human potential for knowledge and virtue is a key idea of Western culture" (p. 19): This is amply demonstrated throughout. Horowitz's concern here seems to be with both those who ignore the West's traditions of virtue and those who in her view unduly emphasize the religious aspects of virtue. Horowitz's second, more ambitious, goal concerns the importance of Stoic ideas for today. "My hope," she writes, "is that greater understanding of the history and diverse applications of a cluster of phrases and of their accompanying educational and civic strategies will be constructive for reaffirming human dignity" (p. 19) and that these "may aid ecumenical efforts for building mutual respect and community among peoples of diverse faiths and traditions" (p. 19). Horowitz's choice of Stoicism to support such ecumenical goals is a good one as her work nicely explains and articulates various manifestations of the Stoic teaching that every human being, male and female, master and slave, etc. is born with seeds of knowledge and virtue already implanted in their souls. The goal of a good society and each of its members should therefore be to help these seeds "blossom," to "cultivate" and "nurture" them, so that everyone's potential may be fulfilled. Indeed, Horowitz's book is filled with an impressive array of thinkers from ancient, medieval, renaissance, and early modern times who used such arguments as evidence for the existence of free will, to provide an epistemological foundation for the scholarly disciplines, for having a program of and open access to learning, to extending the humanist education to women, and in general to argue for human equality (women, slaves, peasants, and the Amerindians included) and against tyranny and cultural domination. Horowitz's book shows that there is much about the Stoics' arguments which is attractive. They systematically work through and make arguments for claims about virtue that today are either assumed or ignored. Any argument which takes seriously the need for knowledge and virtue is welcome, and these arguments, as Horowitz presents them, serve well her ecumenical aim.

More explicit treatment of a few points, however, would strengthen the book. For example, while the Stoics did argue for equality in terms of potentiality (seeds), they also recognized a limited circle of only a wise few in whom this potential would actually be realized. Horowitz knows this, but her discussion of this elitist strand could be more explicit throughout the book. Her discussion of Montaigne, for

example, rightly identifies peasants and the Amerindians as embodying a kind of universalistic ideal, yet she might have balanced this by noting Montaigne's more elitist praise of figures who possess self-knowledge, such as Socrates. Horowitz, like some of the later thinkers she discusses, self-consciously downplays the elitist strands of Stoic thought in order to make it more egalitarian and hence palatable. Other kinds of qualifications of Stoic thought could also be noted in several figures, such as Cicero, Aquinas, and Bodin. In the absence of the Stoics' own elitist (and other kinds of) qualifications of their universalistic seeds teaching, Horowitz is left with what she herself calls an "optimistic and inclusive pattern of thought" (p. xiii) and an "optimistic assessment of human nature" (p. 254). Her approval of Anne Frank's naive optimism as she is about to be murdered ["Yet I keep them [my ideals], because in spite of everything I still believe that people are really good at heart" (p. 20)] further reinforces this point. The gap between this optimistic description of human nature and the one that underlies the views of the great liberal thinkers is striking and raises several questions. What kinds of political institutions would be built upon such an optimistic view of human nature? Horowitz and the authors she discusses are, of course, aware of the nasty and cruel acts human beings commit all the time. To the extent that Horowitz's Stoicism emphasizes universal goodness, might it be less able to foresee and protect against cruel and destructive acts? One wonders whether such an optimistic theory of human nature would lead to less alert and less vigilant institutions, and thus not to more but to less just treatment of human beings in the real, actual world. Perhaps this explains why Stoic philosophy has never served as the basis for any existing government. In any case, a more explicit confrontation of the less "optimistic" aspects of Stoicism and other, more realistic aspects of Montaigne, Bodin, and others might give more satisfying answers to these political problems and strengthen Horowitz's already good book.

If this book's optimism is questionable, perhaps it is because the Stoics themselves barely extend their claims about individual human potentiality to practical political institutions. The strengths of Stoicism as discussed by Horowitz rest more in the educational as opposed to the political programs it implies. In any case, Horowitz's book does an excellent job of bringing out Stoic arguments and showing how in numerous times and places they have been influential, especially in education, in arguing for the pursuit of knowledge and human virtue. Why not today?

Shakespeare and the Good Life: Ethics and Politics in Dramatic Form. By David Lowenthal. Lanham, MD: Rowman & Littlefield, 1997. 274p. \$68.00 cloth, \$24.95 paper.

J. Scott Johnson, *Saint John's University*

On a lazy summer afternoon, political theorists who love Shakespeare will enjoy perusing David Lowenthal's *Shakespeare and the Good Life*. They will find excellent prose, ideas from classical philosophy strikingly juxtaposed with Shakespeare's thought, and evidence of a keen intellect reading and rereading seven of Shakespeare's best known plays. No doubt every student of Lowenthal will wish to own a copy of this book as well. These essays clearly reflect an approach which he says he has developed over three decades of teaching Shakespeare and political theory at Boston College. I can imagine these chapters being delivered orally before a rapt audience of devoted students.

Lowenthal's basic claim is that Shakespeare "generally sought to conceal, rather than reveal, his own systematic

thought or philosophy" (p. vii). He asserts that "Shakespeare wrote for two kinds of people simultaneously—the viewers and the readers" (p. 7) and that contemporary critics' "dogmatic" assumption that Shakespeare was primarily a playwright prevents them from seeing the complexity of his thought. For Lowenthal the story or the plot is only the "surface" of the play. Lowenthal, as a reader, proposes to take us more deeply into the play in order to reveal the "philosophical intention from which [Shakespeare] began" (p. x). He takes "Shakespeare to be an independently thinking follower of classical philosophy—of Socrates, Plato, and Aristotle—whose understanding of their teaching and that of their Pre-Socratic predecessors was profound" (p. x).

In the seven substantive essays that make up the bulk of this book, three of which were published previously in *Interpretation* and a fourth elsewhere, Lowenthal reveals several different aspects of the meaning that Shakespeare was hiding from his audience but not his readers. In *The Tempest*, Lowenthal discovers a consideration of Plato's philosophizing, in *King Lear*, "natural versus conventional justice," in *Julius Caesar*, contending views of the best regime and best life." In *The Merchant of Venice*, Lowenthal shows Shakespeare's preference for a classical cosmology over both Judaism and Christianity. *Macbeth* deals with "natural necessity and the moral character of the universe," *Measure for Measure* with "the Christian view of temperance," and *A Midsummer Night's Dream* "deals with the origins of Athenian philosophy, democracy, and drama" in twelve short pages (pp. x–xi). These themes should be familiar to anyone who has read Leo Strauss. Indeed, when discussing *King Lear*, Lowenthal writes, "It is amazing to discover how much of the play parallels Strauss's account of how the idea of natural right originated" (p. 84).

The main strength of this book is the clarity of its prose and the brilliance of its commentary in juxtaposing diverse images from a variety of sources. For example, in the first essay Lowenthal uses Plato's cave to explore the significance of Prospero's Epilogue at the end of *The Tempest*. Lowenthal describes how Prospero the character sends the other characters back into his cell, which Lowenthal likens to a cave. Then the actor playing Prospero is left alone facing the audience in the theater, another cave, and ends the play. "The audience, representing the city or political life, with its conventional opinions, thinks itself free but is in chains, and must be appealed to by the philosopher-king (and poet) who is free but must pretend to be in chains, and at the mercy of the audience-city" (p. 63). Regardless of whether this was Shakespeare's intent, Lowenthal's juxtaposition forces us to rethink the issues he has raised even if we ultimately reject his claims as unsubstantiated. The work Lowenthal asks us to do in reading his book exercises our minds and frees us to read Shakespeare anew. Lowenthal could have done an even better service to the plays and political theory had he allowed himself more freedom from the Straussian chains that bind him.

Leo Strauss was original. His thought was persuasive in part because of its originality. There is much that can be learned from Strauss's work and that of his followers, yet, it often seems that the followers are more concerned with being true to Strauss than to their own insights into the works they are commenting upon. This is often true as well of the followers of Freud or Marx, persons whom Foucault labels "founders of discursivity." These founders "are unique in that they are not just the authors of their own works. They have produced something else: the possibilities and the rules for the formation of other texts" ("What Is an Author?" In Josué Harari, *Textual Strategies*, 1979, p. 154). Leo Strauss produced

the possibility and the rules for the formation of Lowenthal's text. I cannot imagine what he would have written had Strauss not existed.

When different theorists discuss a particular text using different discursive models they often find that some parts of the text's structure appear alike in their disparate models. If we read Shakespeare as a Freudian we will read a somewhat different play than if we read it as a Marxist or a Straussian. Yet, some facts remain. These facts (for example, the exact words of dialogue) must be taken account of in each of these different readings of the play and, while they may appear somewhat differently in each, these facts will constrain the readings. Understanding the "permanence" of some facts between readings and what this permanence might imply for the meaning of the play requires multiple readings of the play within conflicting traditions of discourse. Lowenthal's book contributes to this broader project by providing us with an excellent example from the Straussian project.

While I enjoyed this book immensely and believe it contributes to political theory, I have two suggestions. First, the literature review is much too abbreviated and ends with works published more than thirty years ago. Students of Shakespeare have published an enormous amount of exciting and influential scholarship on each of the plays discussed which seems to have been read by Lowenthal but is neither explicitly commented upon nor noted. This leads to my impression that instead of naming the authors he disagrees with Lowenthal creates straw men to succumb to the four dogmatic assumptions, which, he says, prevents them from seeing the plays properly or as he does (pp. vii–ix). The dogmatic assumptions are not well explained, and I doubt that he can show persuasively that these prejudices are "well-nigh universal" (p. viii). My second suggestion is closely related to the first. Lowenthal's book needs more thorough citation. His two statements, "I rarely refer to other things written about these plays" and "I took for my models two classics of Shakespearean interpretation . . . both of which are also quite niggardly in citing others" do not excuse this oversight on his part (pp. xi–xii). Senior scholars cannot play fast and loose with their debts to others. It diminishes the scholarly enterprise and sets a bad example for us all.

Given these serious limitations, I reiterate that this book is delightful to read and I recommend it quite highly for its heuristic value. It will make every reader think again about Shakespeare. However, it is not a book that is engaged in the contemporary debates about Shakespeare and it does not attempt to respond to those who disagree with its insights.

Socrates' Education to Virtue: Learning the Love of the Noble. By Mark J. Lutz. Albany, NY: State University of New York Press, 1998. 214p. \$19.95.

Judith A. Swanson, *Boston University*

If liberal democracy stands above all for freedom, then should it promote virtue? Lutz's very readable book not only gets directly to the crux of the matter—namely, "what is virtue?"—but also gives a clear and compelling answer. The central claim of the book is that if we want to understand virtue, then we should study the best account of it—Plato's account of Socrates. Socrates discovered that the chief human virtue is self-knowledge and the chief revelation of that knowledge is a desire or longing not simply for freedom as such but for the good or noble. Indeed, Socrates shows that love of the noble is what animates or inspires reason or philosophical reflection. Lutz suggests then that unless liberal

democracy encourages Socratic philosophy or education, the freedom it preserves will not gratify human nature.

Unfortunately, according to Lutz, two predominant ways of thinking or cultural legacies discourage the cultivation of virtue by mocking either love of the noble or philosophical reflection. Although Lutz does not make it his project to critique Enlightenment rationalism, he suggests that it refuses to recognize such apparently nonrational endeavors as poetry and religion as expressive of a fundamental human longing for self-transcendence or the noble and thus it repudiates the ancient view that such longing, and not just the selfish passions, animates the soul or reason.

By contrast, and worse from the point of view of Socratic virtue, postmodernism dismisses objective, universal reason as Western, historical myth, thereby declaring all judgments relative. In an early chapter, Lutz masterfully debunks Richard Rorty's use of Nietzsche's historical conception of the self to defend liberal democratic morality and politics. According to Rorty, liberalism need not presuppose universal reason or a human nature because its justification does not have to be philosophical; political community is justified or moral *sui generis*, not by virtue of its rational foundations. Indeed, Rorty says, because community is constituted by conversation, its participants exhibit Socratic virtues. According to Rorty, it is Plato, not Socrates, who holds the illiberal view that conversation is worthwhile or virtuous only if philosophically purposeful, revelatory of truths. Lutz worries, however, that if a person believes that his "language, conscience, morality, and highest hopes [are] 'contingent products,'" then what "would prevent him from unleashing whatever political projects he might envision"? (pp. 31, 38). If, Lutz implies, alternatives to radical contingency are not kept in view by philosophy as aided by Plato's doctrine of the ideas, then we have no moral or political constraints. Lutz thus argues contrary to Rorty that Socratic dialectic is not simply depicted but is also vindicated by Plato.

Lutz makes clear that although Plato or "Platonism" vindicates Socratic philosophizing, Socratic wisdom is not, contrary to the contention of many commentators, simply apprehension of theoretical truths or ideals. Lutz shows, through discussion of *The Apology*, *Symposium*, *Republic*, and the lesser known *Alcibiades Major*, that Socrates not only inquires into political, moral, and religious questions or human concerns, but characterizes the whole of his knowledge as knowledge of love.

Lutz explains nonetheless that Socrates claims expert knowledge of erotic matters because he is a philosopher and thus exemplifies love's purest condition. Eros is not "desire in general" but "a single, particular desire, linked to but distinct from human sexuality and rationality" (pp. 87–8). It seems to be between mortal and immortal and thus what moves the soul.

Souls are moved by eros to find what they need, and the needs of souls, as well as the persistence of their eros, differ: "We love only what we believe we need and what we believe we have the resourcefulness to acquire. Should we believe that we are not in need or that we are powerless to acquire what we need, our eros dies" (p. 88). An important aim of Socratic conversation, Lutz notes, is to stimulate desire for knowledge by making individuals aware of their ignorance.

Lutz argues, however, that Plato deliberately complicates or at least questions Socrates' beliefs about eros through challenges put forth by two interlocutors in particular—the comic poet Aristophanes and the ambitious young man Alcibiades. Lutz observes that the account of eros given by the character Aristophanes, which depicts eros as the desire to be reunited with our own particular "other half," Freud

treats as Plato's own account. Plato's message is rather, Lutz implies, that such desire is futile: "Just as our ability to live without our other halves testifies that we are not literally halves of one being, our capacity to love new beloveds suggests that erotic attraction is based not on true and perfect 'complementarity,' but on a recurring illusion that such complementarity exists . . . lovers are *always* in search of their one and only; the perfect complement for whom we search is never to be found. . . . Love affairs eventually fail because no one turns about to be the true one and only. Eros inclines us all to adultery rather than to lasting marriages" (pp. 68–9).

Although Plato does not, according to Lutz, view eros as intense psychic desire for another person but rather as such desire for the beauty of knowledge, Lutz's discussions of *The Republic* and *The Clouds* suggest that Plato and Aristophanes nevertheless agree that love of the city, the family, and the gods is politically salutary. Whereas city and family inspire the courage to be perfectly selfless and perfectly noble, the gods inspire reverence with the hope that they will recompense us with our true other half. Although Plato the philosopher and Aristophanes the comedian seem to believe, respectively, that only private prudence and irreverent laughter yield justice, neither openly spurns piety.

As for the young and vain Alcibiades, who wants both to rule Athens and arouse Socrates, he is critical of Socrates' understanding of virtue because it requires becoming unpreoccupied with politics and sex. Alcibiades gripes that Socrates merely pretends to be erotic or in love to attract students but is in fact in full self-command and self-sufficient—a "real man" (p. 137) who yearns for nothing noble or sensual not even him, the gorgeous Alcibiades. More to the point, Alcibiades thinks that Socrates must be a freak to pass up the chance to do to him what every other grown man wants to.

But Alcibiades' indignation is noteworthy, Lutz suggests, because it confirms Socrates' belief that souls are moved by longing for the noble and good. That Alcibiades is incredulous that Socrates does not want to let himself be overcome by him reveals not only Alcibiades' vanity or *thumos* but his deep psychic belief that beauty can overpower. What Alcibiades fails to understand, of course, as Lutz explains, is that his beauty or nobility does not rival the beauty of speeches partly because of that lack of understanding; if he were truly erotic, he would not let pride preclude gratification of his soul and could truly admire rather than resent Socrates.

Through such perceptive discussion of a number of Plato's dialogues, Lutz answers the question he began with. Unless liberal democracy promotes education that gratifies the human soul by inducing reflection about what is noble, good, just, and sacred, its citizens will learn secular relativism and never long for excellence.

Natural Causes—Essays in Ecological Marxism. By James O'Connor. New York: Guilford, 1998. 350p. \$39.95 cloth, \$19.95 paper.

Eric Darier, *Lancaster University*

This book is the synthesis of James O'Connor's lifetime attempt to explain why Marxism is relevant to an analysis of contemporary capitalism. For example, his *Fiscal Crisis of the State* (1973) is a standard key seminal text on the significance of the post-Fordist era. O'Connor's more recent achievement, however, was to build strong theoretical and practical links between Marxism and environmentalism. James O'Connor, formerly at the University of California in Santa Cruz, is editor-in-chief of the journal *Capitalism, Nature, Socialism: A Journal of Socialist Ecology* and the "Democracy

and Ecology" series editor at Guilford Press, a formidable achievement in a U.S. academic climate generally fairly hostile to Marxism. The collapse of the Berlin wall and the subsequent end of state socialism provide an opportunity to reassess Marxism out of the context of the Cold War.

The central point that O'Connor presents is that to understand the current environmental crisis it is vital to understand the broader economic and political conditions which created that crisis in the first place. For the author, human history and natural history are "dialectically interconnected." Therefore, Marx's analysis of historical materialism is central to O'Connor in a structural understanding of the current environmental crisis. In the final analysis, O'Connor adopts a strong theoretical "economic determinism" that interprets the ecological crisis as the manifestation of the "second contradiction of capitalism." In a sense, O'Connor seems to be fighting a rearguard action against three sets of "enemies." The first is methodological individualism and its allies ranging from "rational choice," "social choice," to moralism. The second set is composed of those he would consider to be "environmental determinists," like Deep Ecologists. The third set is what O'Connor calls "post-Marxists," sometime "postmodernists," or "cultural determinists." These three sets of "enemies" are undermining what O'Connor understands to be "historical materialism." In fact, O'Connor's introduction is devoted in large part to a rebuttal of more recent and trendier versions of (postmodern) Marxism, which tends to focus less on "economic determinist" explanations and more on other elements such as "difference" and "social construction."

I am still puzzled when O'Connor accuses the third group of being committed to "identity politics" (instead of "historical materialism," I presume). I always thought that "class politics" was about the emergence and the sustaining of "class consciousness" that historical materialism analysis successfully rendered "visible." I am also assuming that O'Connor's central practical objective is to articulate a "Red-Green" "identity" (or "consciousness") and not simply to wait for the economic determinist condition to create it. No? There are numerous examples of economically similar capitalist countries in which "class" consciousness is deployed very differently. For example, "working-class" consciousness is still generally more prevalent—as a self-consciously expressed identity—in the United Kingdom than in the United States. A simple economic determinist analysis is not sufficient to explain differences in how "class" ("identity") is experienced in countries that might have very similar capitalist economies nevertheless.

O'Connor seems to be stuck in an epistemologico-practical double bind. On the one hand, "historical materialism" is deployed as a superior epistemological tool that enables telling a "true" story. On the other hand, the seductive power of that story is crucial to the creation of the conditions for the emergence of a new "class"/"Red-Green" consciousness although it cannot be revealed as a "story" but as "truth." This sharp epistemologico-practical divide might explain, on the one hand, the virulence of O'Connor's theoretical critique against partisans of "identity politics" and, on the other, his more conciliatory tone about the practical necessity of building coalitions between ("identity") social movements.

To appreciate critically the importance of O'Connor's contribution to "ecological Marxism," I would strongly suggest that potential readers also consult Ted Benton's edited collection *The Greening of Marxism* (1996), one of the four parts of which presents critical commentaries on O'Connor's central concept of the "second contradiction of capitalism."

Despite some of the problems inherent in trying to offer a

synthesis between Marxism and ecology, O'Connor's *Natural Causes* is already an important point of reference in current debate about environmental politics, theory, and philosophy. In addition to Deep Ecology and Social Ecology (as promoted by Murray Bookchin), O'Connor offers a third perspective on environmental politics.

W. E. B. Du Bois and American Political Thought: Fabianism and the Color Line. By Adolph L. Reed Jr. New York: Oxford University Press, 1997. 282p. \$35.00.

Lawrie Balfour, *Babson College*

W. E. B. Du Bois's declaration that "the problem of the Twentieth Century is the problem of the color-line" has become a truism. Much of the authority of Du Bois's claim stems from the economy with which it captures both a central failing of American democracy and a fact of political life across the globe. Yet, the claim also derives its authority from the stature of Du Bois himself. A scholar and an activist whose lifetime spanned the period between Reconstruction and the 1963 March on Washington, Du Bois was, among other things, a leading participant in the development of American sociology, a founding member of the National Association for the Advancement of Colored People (NAACP), and an architect of twentieth-century Pan-Africanism. Still, despite the frequency with which one encounters Du Bois's words in scholarly articles, newspaper editorials, and books dealing with one facet or another of "the problem of the color-line," much work remains to be done to explore the content of Du Bois's scholarship, the intellectual context in which it was produced, and its contemporary political resonance.

Adolph Reed's thought-provoking study of Du Bois performs an important piece of that exploratory work. In his introductory chapter, Reed identifies two tendencies that have inhibited rigorous analysis of Du Bois's political thought: the treatment of African-American experiences and issues of race as exceptions to otherwise general rules of American politics and the temptation to counter such marginalization with anachronistic, uncritical interpretations of Du Bois. Reed responds to both tendencies by offering readers an historically situated Du Bois, one whose work can be linked to the intellectual trends and political imperatives of his time. From outset to finish, Reed makes it clear that the stakes of his project are not merely scholarly: the volume opens with the eighth of Marx's "Theses on Feuerbach" as its first epigraph, and it gives the eleventh thesis the final word. In between the warning about the susceptibility of theories to "mysticism" and the admonition that the purpose of philosophy is to change the world, Reed presents Du Bois as "one of the very most consistently and resolutely *political* of all twentieth-century black American intellectuals" (p. 177, emphasis in the original).

The first half of the book is a model of the sort of historically grounded scholarship Reed advocates. Reed writes learnedly about the dominant currents in American intellectual life in the late-nineteenth and early-twentieth centuries and evaluates probable influences on Du Bois's thinking about such topics as racial group identity, Pan-Africanism, and socialism. He makes a strong case for the collectivist underpinnings of Du Bois's thought and fleshes out the political implications of Du Bois's faith in the role of scientific knowledge as the engine of social reform and the role of the black middle class as agents of racial uplift. One result is that Reed complicates assumptions about Du Bois's elitism—most famously articulated in the 1903 essay on "The

Talented Tenth"—thereby providing a richly textured portrait of *what kind of elitist* Du Bois was. Reed also helpfully traces changes in Du Bois's ideas about the relationship between social class and virtue, noting how Du Bois refashioned the concept of the "Talented Tenth" in response to his disappointments about the consumerism of the black middle class in the post-World War II period. Likewise, Reed unpacks assumptions about Du Bois's commitments as a democrat. Although Du Bois is rightly remembered as a champion of political and civic equality, Reed's examination of *The Philadelphia Negro* (1899) chastens against the temptation to gloss over the antidemocratic ramifications of Du Bois's faith in social evolution by relating Du Bois's comment that social stratification among black Americans is a natural product of their having democracy "prematurely thrust upon them" (Du Bois, quoted on p. 38).

Questions of leadership figure centrally in Du Bois's thought and in Reed's account of it. As Reed notes, Du Bois's conflicts with Booker T. Washington and Marcus Garvey were crucial in defining black politics in the early part of the twentieth century. Reed's attention to these internal debates provides a reminder that the thought of Du Bois and his interlocutors ought not only to be viewed within the parameters of protest. Instead, Reed indicates how much work there is to be done to recover the broader aspirations of these and other black thinkers by raising "the simple question, seldom asked of black political figures": "What sort of society would they create if they could restructure the world according to their own designs?" (p. 89). Beyond the historical value of this line of inquiry, there is the promise, for political theorists especially, of finding relatively untapped resources for thinking about democratic leadership in a racially hierarchical society and about the nature of representation more generally.

By insisting on the significance of intellectual context and defending the normative unity of Du Bois's writings, Reed strives to prevent their incorporation into agendas that Du Bois would have found uncongenial. While Reed's dedication to this end yields illuminating readings of Du Bois's thought, it also unnecessarily constrains those readings. For instance, Reed's arguments for the view of social evolution underlying Du Bois's conception of double consciousness enhances the reader's understanding of Du Bois's famous articulation of the experience of "twoness." Yet, to say that "Du Bois was unambiguously in step with the conceptual orthodoxy defined by the Lamarckian social science of his day" (p. 121) is to ignore the polyphony of Du Bois's thought and of a book like *The Souls of Black Folk* (1903) in which the idea of double consciousness is elaborated. Among the achievements of *Souls* in its display of the limitations of scientific discourse to capture and to understand the anguish of the post-Civil War period. Moving fluidly from history to polemic to elegy to fiction, Du Bois describes men and women, black and white, whose wounds cut deeper than ignorance and are not susceptible to remedy by the better organization of society. *Souls* also qualifies Du Bois's confident assertions about the "Talented Tenth." Both the chapter on nineteenth-century nationalist intellectual Alexander Crummell and the short story about John Jones evoke the alienation of educated blacks from the beauty of African-American life. Read in light of Du Bois's comment that "the price of [modern] culture is a Lie" (*The Souls of Black Folk*, p. 167), these chapters expose Du Bois's reservations about the costs of racial uplift and provide a more nuanced understanding of his politics.

It is in the latter half of Reed's book that the reader most senses a missed opportunity. The longest chapters shift the focus of discussion from Du Bois himself to disputes about

the proper direction of African-American scholarship. Reed challenges the appropriation of Du Bois's legacy in the constitution of a black intellectual tradition that, he contends, privileges literary accomplishment and "cultural authenticity" over political history and progressive political action. What is neglected in Reed's critique is the development of his own views, which are laid out briefly in the introduction, about the study of African-American political thought in relation to American political thought and political science as a whole. Where Reed laments the influence of Henry Louis Gates Jr.'s definition of an African-American literary tradition, he might instead have offered valuable insights into the role of canon formation in the study of politics. Such a discussion, moreover, would have allowed Reed to say more about the dangers of adding Du Bois's name to the pantheon of "Great Men and the occasional Great Woman" (p. 184) and about how his call for renewed attention to Du Bois as a political thinker escapes such pitfalls.

Animating Reed's argument is a sense of alarm about what he sees as a disconnection between the study of African-American political thought and the achievement of racial justice. Thus, his second epigraph, Hegel's statement that "the owl of Minerva spreads its wings only with the falling of the dusk," calls to mind the concluding words of Sheldon Wolin's "Political Theory as a Vocation" (*American Political Science Review*, December 1969, p. 1082). "In Greek statuary," Wolin writes, "Minerva's pet was a screech owl, for a screech is the noise both of warning and of pain." Even readers who do not share Reed's views about other interpreters of Du Bois's texts, or who wish for more tempered assessments of his own interpretations, can nonetheless appreciate the sense of urgency that pervades this book. That Du Bois's pronouncement about "the problem of the color-line" still rings true in the twilight of the twentieth century indicates the timeliness of such a call to arms.

The Cambridge Companion to Mill. Edited by John Skorupski. New York: Cambridge University Press, 1998. 591p. \$59.95 cloth, \$18.95 paper.

Robert Devigne, *Tufts University*

In the winter of 1854 coughing fits and the spitting of blood convinced John Stuart Mill that he was suffering from tuberculosis, the disease which killed his father. Confronting the possibility of an early death, Mill wrote to his wife about producing a series of essays designed to summarize their views on the most important questions. Most are not surprised to find on Mill's agenda the themes found in *On Liberty*, *Utilitarianism*, and *The Subjection of Women*, but few expect to find the topics found in *Three Essays on Religion* and "Grote's Plato."

The *Cambridge Companion to Mill* takes valuable, albeit hesitant, steps toward helping us understand why Mill found substantive reflections on religion and classical political thought so important. Mill, according to several contributors, saw the need for liberal societies to discipline themselves through a commitment to the general good while at the same time encouraging the forces of human creativity. Mill hoped to accomplish this double task by joining modern individualism to a new ethical and religious sensibility. In addition to the essays discussed below, informative analyses of these complementary political goals are found in essays by the late John Robson on civilization and culture as moral concepts, Jon Riley on political economy, Wendy Donner on utilitarianism, and Mary Lyndon Shanley on women. Peter Nicholson's essay on the reception of Mill's thought has a particu-

larly interesting analysis of the way British Idealists at the turn of the century transformed Mill from a "public moralist" to an atomistic individualist. As he points out, this reinterpretation of Mill was a part of their effort to recast liberalism as a doctrine centering on the state rather than civil associations. John Skorupski, Philip Kitcher, and Geoffrey Scarre analyze Mill's contributions to the study of logic, mathematics, and the scientific method.

This volume reflects an emerging debate over the lessons to be learned from Mill's thought. We are all familiar and comfortable with the depiction of Mill as the champion of the individual against a tyrannical majority. But to what extent was he concerned with the dangers of moral disintegration and more interestingly still, to what extent was he engaged with joining these two concerns? The traditional view of Mill, notably articulated by Isaiah Berlin, recognizes competing emphases in Mill's thinking but is unable to find coherent aims. Indeed, in *Four Essays on Liberty*, Berlin (1984) suggests the central tenet of liberalism—choice—is based on Mill's and liberalism's ambivalence concerning what is right or wrong, good or bad. Revisionists such as Alan Ryan have identified a coherent doctrine in Mill's thinking but neglect many of his moral and religious concerns in favor of a focus on when behavior infringes on the rights of others.

An approach more fruitful than either of these is indicated by T. H. Irwin in his essay in this volume concerning classical influences on Mill. He notes that both Mill and the influential classicist George Grote—considered by Mill an heir to Bentham's utilitarianism—approved of Plato's dialectic which challenged standards of good and bad through cross-examination. To Mill, the Platonic dialectic establishes the premises for the argument on behalf of freedom of discussion in *On Liberty*. The dialectic not only serves those who wish to discover truth, it also aids those who aim to understand truth, requiring them to defend their assertions through conflict and debate.

Like Grote, Mill finds Plato's concept of the Ideas—ultimate understandings that are eternal—cannot answer the questions generated by the dialectic. Unlike Grote, however, Mill does not completely reject this positive side of Plato's thinking. Mill finds that the doctrine of Ideas reflects Plato's understanding that an idea of the good must be fostered to generate human sociality. Mill's regret is that Plato did not discover a firm basis for such a morality and ethics to allow societies to rely on more than the interdependence of interest. Plato depended exclusively on art. Nonetheless, Mill learns from Plato the need for a value system with two distinct, but equally valid ends: the promotion of creative individuals who are liberated from the constricting norms of everyday society and the development of a civilization characterized by sympathetic bonds among its members. Irwin explains that Mill's differences with Grote's view of Plato coincides with his rejection of the restricted view of human nature typical of classical utilitarian doctrine.

Irwin also could have considered other classical sources which contributed to Mill's outlook. Mill extolled the creative willfulness of the Athenians while praising the role that education played in fostering stability in Sparta. At the same time, Mill maintained that Athens was too dependent on the qualities of its most forceful citizens, and criticized Spartans for being too acquiescent. Mill consistently addressed these respective strengths and weaknesses of Athens and Sparta as a backdrop to his project of developing a new understanding of the good and the place of modern individuality within it. Mill was deeply influenced by Aristotle as well as he attempted to formulate a modern morality, weaving together the arguments that

ethics must foster habits that overcome our natural instincts, but that virtues, far from being mere conventions, reflect an assessment of the ways human nature can be either base or noble. Consequently, while Mill argues that nature itself is incapable of establishing an ethical standard of the good and is a source of more evil than beneficence, nature is to be studied and amended, not ignored.

As Alan Miller points out in his essay on religion, Mill knew that religion spoke to the human desire to live a meaningful and beautiful existence. Fearing that Christianity is no longer capable of generating the ethical underpinning that a liberal society needs, Mill discusses the need to augment it with a public opinion animated by a "Religion of Humanity," an ethos that would elevate the human intellect, channel willfulness, and incline citizens to meet minimal social obligations. While Mill reserved his most comprehensive statements on a Religion of Humanity for his posthumous publications, diary, and private correspondence, Miller explains how the premises of this new ethic can be found in *Utilitarianism* as well where Mill explains that modern equality provides the basis for extending and deepening the bonds of human sympathy.

What is missing from *The Cambridge Companion to Mill* is a comprehensive assessment of Mill's overall political philosophy. While Alan Ryan's essay situates Mill among key liberal thinkers, Ryan continues to eschew or revise those parts of Mill that conflict with his own outlook. In a previous work, Ryan, upon identifying a Platonic strain in Mill's thought, dismissed any further investigation of this point since "Mill's age had not learned to see Plato as a totalitarian" (*J. S. Mill*, 1974, p. 130).

In his essay offered in this volume, Ryan revises Mill's views on religion in the context of Mill's argument on human excellence in Chapter 3 of *On Liberty*. In that chapter, Mill bemoans the Calvinist inspired outlook that denies the "self-will" and associates the good solely with obedience. For an alternative idea of excellence one must reach back beyond Christianity and Plato to the Periclean age where "pagan self-assertion" was encouraged. But, Mill realizes that a society's praise for self-assertion can produce individuals who assert themselves in order to pursue the public good (Pericles) as well as individuals who put forward their will at the expense of others (Alcibiades). Consistent with the essays noted above, Mill concludes that there is a need to develop an idea of excellence that "blends" the creative qualities of Pericles with the moral ideas of the good expressed by Plato and Christianity. "There is a different type of excellence . . . a Greek ideal of self-development, which the Platonic and Christian ideal of self-government blends with, but does not supersede" (*On Liberty* in *Collected Works*, vol. 18, 1977, p. 266).

Ryan appears to miss Mill's point. Where Mill sees a dialectical relation between individual willfulness and an ethical or religious idea of the good, Ryan only sees the rejection of religion: "The target of Mill's assault was self-abnegation. He contrasted Christian self-abnegation with pagan self-assertion. . . . One can forgive Mill for following Machiavelli in praising pagan self-assertion to the detriment of the Christian ideal of self-abnegation. In gross at any rate that contrast holds up perfectly well" (pp. 517–8).

Ryan's failure to appreciate the influence of either Plato or religion on Mill's thinking reflects an approach to liberalism that inhibits the study of its foundational principles. Commentators in this tradition recognize that liberalism's highest goals are a radical break from ancient philosophy's and medieval faith's focus on the virtues required to live in

conformity with a transcendent order. But this understanding of liberalism's new aims can be overemphasized to the point of overlooking how alternative currents of thought either contribute to or buttress the modern project. Given this interpretation, it is not surprising that in recent decades liberalism has become identified with indifference to substantive moral concerns.

As long as contemporary readers of Mill restrict their analyses to what they find as original and beyond the past, they will continue to misidentify him with a liberalism that is far more narrow and one-dimensional than Mill's own political philosophy. It also means many of the important insights contained in the volume under review will be overlooked and lost.

Ecofeminist Natures: Race, Gender, Feminist Theory and Political Action. By Noël Sturgeon. New York and London: Routledge, 1997. 260p. \$69.95 cloth, \$18.95 paper.

Cynthia Halpern, *Swarthmore College*

In his article "Love Thy Neighbour? No Thanks!" in *The Plague of Fantasies* (London: Verso, 1997, p. 45), Slavoj Žižek recapitulates Lacan's distinction between knaves and fools: The right-wing intellectual is a knave, "who refers to the mere existence of the given order as an argument for it," while the left-wing intellectual is a fool, "who by means of his lucid procedures destined to 'subvert' the existing order, actually serves as its supplement." In her book, *Ecofeminist Natures: Race, Gender, Feminist Theory and Political Action*, Noël Sturgeon skirts Lacan's designation of left-wing intellectuals with a discomfiting closeness by analyzing the precarious divide between scholarly and activist debates. She alerts us to an element of silliness in arguments about name-calling and in-fighting among a very small number of people engaged in political actions in the context of the much larger necessities of global politics. She also reminds us of the tasks of left-wing intellectuals.

Ecofeminist Natures is about two contested terms of identity in contemporary feminist discourse—ecofeminism, and more improbably, essentialism. The author does very well in addressing the history and differentiating struggles out of which the various organizations and meanings of ecofeminism have evolved, especially in feminist and environmentalist politics. She does less well explaining why "essentialism" has become a term of disapprobation and a weapon of attack in these discourses, or in exploring systematically the meaning of the term in theory in contrast to the way it has been used in practice. That is the larger and more interesting question that is raised here.

What is at stake in these arguments over names? Sturgeon looks to address the unfairness of labelling as "essentialist" certain feminist variants, especially ecofeminism, in order to dismiss them from the ranks of legitimate feminisms, even though, she admits, they are in part, or in some versions, "essentialist." She argues and demonstrates, however, that the "essentialism" of ecofeminism has been strategically effective in mounting a political opposition against other sexist environmentalist adversaries at different times.

Sturgeon operates throughout with a pretty murky understanding of the problem of essentialism. Strategic essentialism derives from the problem of validating essentialist concepts, which originated in early modern chemistry from chemical essences, that which cannot be reduced further, that is, that which obviates scrutiny because it is already and purely itself. As Gayatri Spivak has so productively demon-

strated elsewhere, by using and contesting essentialist concepts, we promote scrutiny of something which effaces or disavows scrutiny. Philosophically, essentialist concepts can only take their meaning from their use in particular contexts; they function as essences only in context. Sturgeon fails to recognize the highly contextual nature of the nature/culture distinction, or the woman/nature distinction; she ignores the indispensable role of context in explicating or using any such terms, as affirmed by theorists from Levi-Strauss to Sherry Ortner. One of the most important conclusions here, both consciously argued in the book and unconsciously demonstrated by it, is the vast distance that lies between serious theory and the political practice of activists, even feminist theory and feminist practices.

Sturgeon recounts the story of ecofeminism in feminist environmentalism in order to set the record straight. In her first chapters, she gives us some fascinating recent history: the relations between ecofeminists and Murray Bookchin's social ecology, between ecofeminists and deep ecology, between ecofeminism and *Earth First!* She describes the origins of ecofeminism in the Antimilitarist Nonviolent Direct Action Movement and gives a very detailed picture of the women and issues at stake in the development of WomenEarth and the WomenEarth Feminist Peace Institute.

Sturgeon writes her best chapters on the nature of race, "indigenous women and white goddesses," and global environmental politics. She highlights the problem of racism throughout her book. She moves from a discussion of the peculiar white-nonwhite concept of racial parity in WomenEarth to a much more serious discussion of the abuse of Native American spirituality in New Age environmentalism and ecofeminist spirituality. She is clear about the racism of "borrowing" the spiritual practices of Native Americans and using them out of context. She is also clear about the abuse inherent in idealizing third world indigenous women as icons of racial and environmental purity in the international environmental and feminist movements.

Finally, to the major point in the book. Sturgeon argues that "in general, feminist theory is not used as much as I think it should be to illuminate radical activist movement practice" (p. 6), and "the most vital radical political theories develop in tandem with radical movement practice; one does not precede [sic] the other" (p. 195). She knows that "doing feminist theory" is political, because it involves "teaching, promotion, and publishing practices that form, critique and resist unequal arrangements of power" (p. 7), but theory should be "articulated" to feminist practice. Sturgeon asserts the priority of practice over theory and the importance of activist politics, in contrast to "power-elite theorists" who run things, it seems, and have no respect for the hard-working, and suffering, activists in the trenches. This is seriously to misunderstand theory and the political nature of theory.

Political theory is not primarily, or even secondarily, about justifying or producing political practice, and the greatest theorists have not taken their cue from those on the front lines. They have designed those lines. Theory is its own justification and its point is knowledge, which is by its nature power, because through knowledge reality is structured. Theory, if taken seriously (not as typologizing), can help unravel some of the knots that bind the participants described in this book, but that is not its trade. Theory translated superficially into micropolitics, as "essentialism" is shown to have been, is no longer theoretical, but instrumental, and the difference is crucial.

The Fetishism of Modernities: Epochal Self-Consciousness in Contemporary Social and Political Thought. By Bernard Yack. Notre Dame, IN: University of Notre Dame Press, 1997. 182p. \$28.00.

Stephen K. White, *Virginia Tech*

The polemical tone of this book is evident all the way from the title to the back of the dust jacket, where the blurb reads: "Postmodernists of the world: beware . . ." Yack's targets are intellectuals responsible for the "outbreak" of a "contagion," a disease of the mind: the propensity to "fetishism." Borrowing from Marx, who criticized capitalist society for its treatment of commodities less as human creations than as independent entities with a life of their own, Yack contends that the current theoretical landscape is dominated by the fetishization of the idea of modernity; more specifically an "obsession" with "the idea of modernity as a coherent and integrated whole" (pp. 13, 29–30). Yack wants to round up the agents of disease and cleanse them (an epigraph from Ernest Gellner at the beginning of one chapter reads: "The sooner this nonsense stops, the better"). Who exactly needs to be rounded up? The list includes some "big names": postmoderns like Lyotard, certainly, but also the "Left Kantians," a pretty extensive group including Marx, Marcuse, Heidegger, Habermas, and others—although Yack admits that he will use them "only as illustrations of my argument rather than as the subject of detailed commentary" (pp. 15, 42–3, 48–9). When an author moves with such persistent polemical intent and yet admits some lack of attention to detail, perhaps not just postmoderns should beware.

The fetishists' tendency to portray modernity as an integrated whole is born of a consistent failure to distinguish between "temporal and substantive concepts of modernity" (p. 24). The former relate to a modern age; the latter to some set of ideas and institutions we might want to claim are distinctively modern. One could, for example, think of the modern age as beginning with a cataclysmic event like the French Revolution; but one should separate this temporal delineation from what one might wish to contend are specifically modern phenomena such as a certain notion of scientific method. When these concepts are not clearly separated, we continually stumble into the implausible claim "that everything after the modern divide is characterized in some important way by distinctly modern ideas and practices" (p. 29). This leads us to accord modern life more coherence than it really has. And when we do that, it is easy to begin inflating a discussion of specific changes in contemporary life into talk of the "end" or "collapse" or modernity, or of the onset of a new unity: postmodernity. (Since talk of such a new age is parasitic upon the illusion of a coherent modernity, Yack calls postmodernity "a mere figment of our modernity fetish" [p. 66].)

The real harm arising from fetishism is that its images of wholeness hide from view the fact that the modern age exhibits "a large degree of incoherence" resulting from a varied mix of modern ideas and institutions with ones that "either resist or are indifferent to the unprecedented dynamism" introduced by scientific-technological change and the demystification of traditional authority (p. 36). It is only after accepting this incoherence that interpretive justice will be done to important contemporary political phenomena like nationalism or religious fundamentalism. This point extends as well to the character of liberal democracy. Yack argues that we get a better understanding when it is comprehended not merely as the political face of a seamless modern whole, but rather as an "incongruous" combination of modern ideas like individual rights and social equality, on the one hand,

and constitutionalism and the rule of law, which are inextricably entangled with nonmodern notions of veneration of authority and the past, on the other. When these issues are occluded by fetishism, we miss "some of the most interesting tensions in contemporary political experience" (p. 89).

Despite his distaste for talk of postmodernity, Yack is careful to point out that he is actually "quite sympathetic" to postmodernism, at least in its endorsement of "skeptical, pluralist, perspectival attitudes" (pp. 64, 155). These remarks, as well as his assertion that liberal democracy rests to a good degree on the affirmation of tradition, seem to position him reasonably close to someone like Richard Rorty.

Yack's ultimate goals are ones I would endorse to a substantial degree. Theoretically, we should strive for "a more cautious and self-critical approach to modernity" (p. 137). Politically, we need to enliven our sense that we live in an incongruous mix of modern, nonmodern, and postmodern ideas and institutions; and that the real questions have to do with how we "balance" all these (p. 40). These issues are immensely complex, and Yack is right that little good comes from immersing them in oversimplified frames of modernity or postmodernity.

Yack is at his best when he is following his own advice about caution and self-criticism. His key suggestion that we keep teasing apart temporal and substantive claims in discussions of things modern and postmodern is a very useful one. But his polemical bent mars this book. He might, of course, quickly reply in his defense that some of the targets of his attack have hardly been shy when it comes to the polemical exhortation of liberals like himself. There is no doubt a good bit of truth in such a defense. But Yack is counseling caution, common sense, and a wariness toward getting trapped by one's own generalizations. It is fetishism "to treat our own creations as if they have a life of their own" (p. 7). Yet, Yack may have let his own concept of the fetishism of modernity turn into a fetishization of his opponents, who are sometimes made to dance to a prescribed drum beat. I will point to only one instance of this problem. The leading example Yack employs to introduce the reader to a fetishized view of modernity is a quotation (p. 18ff) from William Connolly's, *Political Theory and Modernity* (1993 ed.). Even assuming that the alleged confusion between the temporal and substantive notions of modernity is in fact present in that text, one might have expected that Yack would go on and draw out systematically how this confusion produces substantial, harmful consequences in the author who has been singled out. But little is done in this regard. Had Yack been more concerned to look carefully at his opponent's work, as opposed to using it as an "illustration," he might have discovered discussions of phenomena like religious fundamentalism that in fact treat contemporary society as displaying just the kind of incongruous mix that Yack sees as characteristic. (See *The Ethos of Pluralization*, 1995.)

Intersecting Voices: Dilemmas of Gender, Political Philosophy, and Policy. By Iris Marion Young. Princeton, NJ: Princeton University Press, 1997. 195p. \$49.50 cloth, \$12.95 paper.

Nancy J. Hirschmann, *Cornell University*

This collection of previously published essays by a leading figure in feminist philosophy touches on some central controversies in feminist theory. Although I almost always find something to disagree with in Young's arguments, her essays are stimulating and thought-provoking, and the ideas that they introduce—gender as seriality, asymmetrical reciprocity,

a rethinking of justice and the family, the need to replace deliberative with communicative democracy, the notion of home—are creative and invigorating to feminist philosophy.

Though Young could have done a better job in the introduction tying these articles together—indeed, she makes no effort to hide the fact that she thinks the essays are rather disparate, raising the question of why she wanted to have them collected—in fact there is more coherence here than Young herself recognizes. In particular, the theme of communication, particularly of listening, is one that threads through almost every essay in the volume. A key notion she is drawn to is that of respecting all members of a community, which requires not only an expansion of "community" to recognize the ways in which exclusion defines membership but also a deep and genuine listening that attends to others' subjectivity as well as to the institutional parameters that determine inequities of power, both formal and informal, overt and subtle. Central to this enterprise is the construction and meaning of identity, and the constitution of contexts within which meaning takes place.

These themes are particularly illustrated in "Asymmetrical Reciprocity: On Moral Respect, Wonder, and Enlarged Thought." Young problematizes a notion that has become important to much feminist theorizing, of being able to envision the self as other, because such moves often hide differences in power that foster appropriation and hamper listening. Citing a telephone poll in Oregon to which able-bodied citizens responded that they would rather be dead than disabled, Young points out that people with privilege do not really listen to the perspective of the less fortunate but rather superimpose their privileged position on the other's circumstances. Because they do so from their position of privilege, they generally misunderstand the other's perspective, thus reinforcing power inequalities. In this case, Young claims that this survey provided the justification for policies denying coverage of certain health-care benefits to the disabled, which in turn perpetuated the inability of the disabled to be heard. The solution is to strive for reciprocity—for exchange, interdependence, common effort—that begins from the recognition of asymmetry in social relations. Similarly, in "Communication and the Other: Beyond Deliberative Democracy," Young argues for a political practice of listening, suggesting that communication requires genuine respect and the willingness not only to acknowledge the limits of one's own understanding but also to be changed by what one hears. She opposes this vision to the conflictual character of deliberation where outcomes are measured in terms of wins and losses by entrenched positions. Listening is also a theme in "Punishment, Treatment, Empowerment: Three Approaches to Policy for Pregnant Addicts." Focusing on pregnant drug addicts, Young attempts to develop an approach to policy that does not infantilize women, that empowers them by recognizing their subjectivity and agency—by listening and attending to their experience—and that highlights the dangerous assumptions and coercions that state treatment programs often demonstrate, and yet seeks to protect unborn babies.

In "House and Home: Feminist Variations on a Theme"—the only essay in this collection not previously published—she again points out the ways that power systems of sex and class prevent some women's stories from being heard. Thus, Young tells her own mother's story of the struggle to support her family in an age of intense social control over unmarried women, a story with lessons for today's welfare surveillance. Though home can and has been an oppressive notion, one of exclusion, erasure of difference, and a withdrawal from politics, Young criticizes many feminist rejections of home as

often elitist refusals to listen and argues instead for a feminist political reconceptualization of home that incorporates notions of safety, preservation, privacy, and individuation.

Other essays give less overt prominence to listening and communication but incorporate them as subtextual and even methodological messages. In "Gender as Seriality," Young tackles a central controversy in feminist theory: how to establish the term "woman" as a theoretically useful category without replicating the modernist imperialist gesture of treating the experience of privileged groups as a universal category. The issue of "difference" among women has been one that is both empowering to feminism, in bringing to view the diversity of experiences that the people called "women" have, and yet at the same time crippling, by silencing any invocation of the term "women" as by definition universalizing and hence imperialist. Gender as a series, an idea Young borrows from Sartre, gets around this impasse; regardless of how "different" women in fact are, the fact that they are treated as if they are all the same makes women, in some sense, actually the same. This sameness may exist only at the surface level—a fact which neither contradicts deeper differences among women nor is meaningless politically or morally—but needs to be recognized if women are to be able to communicate their experiences and to listen to each other as well as to be heard by men.

In "Reflections on the Family in the Age of Murphy Brown: On Gender, Justice, and Sexuality," in many ways the best essay of this collection, Young addresses strategies for being listened to. Specifically, she takes on the issue of how family is defined, and in particular attacks the state privileging of the marriage relationship. In keeping with the work of others like Martha Fineman, Young questions gay and lesbian activists who advocate for the right to marry and instead suggests that the legal privileging of the marital relationship should be abolished; the efforts of disempowered groups such as gays to access the power of this privilege in order to gain the power of legitimacy, and thus be heard, does not equalize power, but instead unthinkingly perpetuates unjust privilege and inequality. It is thus politically, if not morally, self-defeating. She makes this claim in the interests of a feminist notion of justice; in critiquing the dominant distributive model of justice, Young finds conceptual links between that model and assumptions about the givenness of heterosexual marriage as the foundation for family! Uncoupling these involves a simultaneous redefinition of justice and an enlargement of the notion of "family" to allow for a greater variety of forms within the parameters of legal sanction.

In all these essays, Young puts her finger on the pulse of central controversies within feminist theory. The ideas of gender as a series and asymmetrical reciprocity in particular are intuitively appealing, provocative, and stimulating. This is not to deny that her essays display inconsistencies and other problems. For instance, in asymmetrical reciprocity, the question remains: Why should those with power listen to those without? Doesn't that presuppose a kind of symmetry, that is, an equality of power and right? And where does this equality come from if not power? Young does not address this circularity. Indeed, in "Communication and the Other" she does assert that equality is a necessary condition of

making communicative democracy work, but she does not suggest how such equality is to be attained; or more precisely, she fails to acknowledge the vicious circularity of inequality, and how power begets power, that is recognized in some other essays. Furthermore, she glosses over the issue of disagreement; how much is allowable within community, how much room for dissent should there be, how much is consistent with meaningful and productive communication? Can you really listen to someone if you disagree deeply and inequality defines your relationship? But if listening is the key to equality, how can that be achieved?

Moreover, Young does not always give credit where it is due; for instance, her view on the problems of seeing the self as other is actually put forth by feminists of the "care perspective," of which she is critical. In *Women's Ways of Knowing* (1997), for instance, Clinchy et al. explicitly reject putting oneself in the other's place as individualistically self-referential and argue that adopting the other's perspective requires listening and empathy. It may be that such feminists are overly optimistic about the ability to hear and understand different others, but that is not Young's objection. Her critique of "deliberative democracy" also seems at times overdrawn; as Jane Mansbridge points out in her theory of "adversary democracy," deliberation can often be conflictual but is not necessarily so. Indeed, the deliberation envisioned by a number of democratic theorists such as Benjamin Barber does not resemble Young's picture. Similarly, her distinction between identity and series, although innovative and attractive, may reduce the complexity of identity somewhat artificially and even arbitrarily. Indeed, Nancy Chodorow, whose view of identity Young explicitly rejects, in fact defines identity in terms that already incorporate Young's definition of seriality. Identity has both active and passive components; involving ascription by others in a complex dynamic; but Younger asserts that identity is active self-identification and saves the more passive components for "series." While theoretically convenient, however, and seductive in terms of its ability to resolve a key controversy in feminist theory, I am not entirely convinced this is correct: For instance, the *identity* "black" originated in white Europeans' attribution of race-difference on which the institution of slavery was built. This created a conception of "difference" for Africans and their African-American descendants based on continued treatment by white race-prejudice. The active self-identification "black" can be a powerful act of resistance, but inevitably works interactively with how whites have treated and defined blacks, as well as how they do so today, as well as with how racism constructs and constrains both black and white actors. Thus, to call race a "series"—and the comparatively pedestrian example Sartre offers is people waiting for a bus—runs the risk of trivializing and weakening this historical construction of racial identity, as it may do with gender.

Though these criticisms are not minor, however, they do not really detract from the strength of the individual essays, which are solid illustrations of Young's creativity, originality, and strength as a theorist. Indeed, it is a unique quality of Young's work that the strength of the criticisms that can be lodged against her testify to the provocativeness of her theorizing.

American Politics

The Price of American Foreign Policy: Congress, the Executive, and International Affairs Funding. By William I. Bacchus. University Park, PA: Penn State University Press, 1997. 343p. \$55.00 cloth, \$18.95 paper.

Heidi H. Hobbs, *North Carolina State University*

The success of American foreign policy initiatives are dependent on the amount of money Congress appropriates to them. Bacchus explores the special relationship Congress and the executive enjoy in international affairs funding from an insider's point of view. Currently the executive director of the Quality Council of the U.S. Agency for International Development, Bacchus brings both academic credentials and more than twenty years of government experience to bear in his examination of this often neglected topic.

The central thesis of this volume is that many of the trials and tribulations of American foreign policy in the past quarter century can best be examined through the intricacies of the budgeting process. The fine balance that exists between the different branches of government are particularly exacerbated by the extent to which executive leadership is supported by congressional allocations of resources. Of particular concern is the attempt by Congress to become a "co-equal partner" with the executive in foreign affairs through the budget process (p. 39).

Bacchus examines this relationship by first delineating the exactitudes of the budgetary process—where funds appear and the percentages of the overall budget that they constitute. Unlike defense, the foreign affairs budget is fragmented both as it is proposed by the executive and then processed through the Congress. Policy initiatives as they come from the president and particularly, the Department of State, are more focused on "high policy" as opposed to the "low" concerns of the budget. The result is that initiatives and allocations are often mismatched, both in dollar amounts and timetables established for the operationalization.

The process is also subject to political whims and the current topics of the day. At several points in the book, Bacchus identifies areas where congressional intervention was driven by hot issue areas, political concerns, and domestic influences. For example, concern over security at the Moscow embassy when it was found that the Soviets had been "bugging" the building during construction in 1986 resulted in extensive funding for securing the building. Congress responded with allocations of more than \$4 billion in the first four fiscal years (1986–90) following the discovery. Yet, it took ten years to decide upon a course of action that would effectively address the problem. Further delays and debates over the best way to respond to the issue have continued with the expected completion of the project estimated now for 1999, more than twenty years after the initial appropriation.

Several myths have grown up around this process that the author methodically dismisses. Most notably, he argues that interbranch differences are *not* now "worse than ever," despite partisan differences; foreign affairs funding *is* often bipartisan; monies *are* allocated even when the pay-off is not clear; iron triangles *are* alive and well and have even broadened in scope to reflect ethnic interests (Israel and Egypt, Greece and Turkey); and finally, funding *does not* always follow policy changes (for example, continued extensive funding of the Voice of America).

Efforts to change these processes have been limited. The congressional election results of 1994 were anticipated to bring major change to what at best could be characterized as an uneasy relationship. In fact, as Bacchus profiles the events

of the subsequent year, efforts to downsize executive branch control of foreign affairs through "merger" were unsuccessful as the president vetoed the hard fought bill that was ultimately produced. The following year, however, the president himself introduced the concept of "merger" as a downsizing strategy.

Bacchus believes these institutional conflicts will continue, regardless of who is in power, and it behooves the government to develop effective procedures that will streamline and depoliticize the process. Toward that end, he makes several recommendations for both the executive and Congress. Specifically, he argues for an integrated executive branch foreign affairs budget that is more directly tied to policy initiatives, linking resources to policy. On the congressional side, Bacchus urges consolidation of the foreign affairs budget. This will streamline policy prioritization, conserve members' time and energy, and ultimately, promote better relationships between resource allocation and policy priorities. He also favors a two-year budget cycle toward this end.

Overall, this is a thorough review of the structure and functions of the budget process over the last 25 years as they are related to foreign affairs. The volume is rich in details of the three-fold process—budget, appropriations, and authorization. It explores the many efforts to streamline the process and does a very good job in presenting the intricacies of the executive-legislative relationship in foreign affairs funding. The writing is personable and organizationally refreshing, with examples and case studies successfully integrated throughout the volume. It will be of interest to congressional scholars and particularly illuminating to American foreign policy scholars, whose knowledge of the budgetary process may be limited.

Presidential Responsiveness and Public Policy-Making: The Public and the Policies that Presidents Choose. By Jeffrey E. Cohen. Ann Arbor: University of Michigan Press, 1997. 289p. \$49.50.

Michael Margolis, *University of Cincinnati*

Those who would develop theories that relate public opinion to the policy leadership role of the American presidency face the daunting task of generalizing from a small number of observations. Starting with Teddy Roosevelt's modern "rhetorical presidency" (p. 240), only seventeen men have occupied the office of President of the United States, nine since 1953. That the American presidency is a unique institution and that each president has his own policy agenda, ideology, political skill, and style make the theorist's task even more difficult. Add the major political events that affect each presidential administration, and the number of potential independent variables begins to approach the number of observations on the dependent variable(s). Keenly aware of these difficulties Jeffrey Cohen nonetheless makes a fine—though inevitably flawed—effort to develop and test a theory of presidential responsiveness to (and leadership of) public opinion.

Americans have dual—and sometimes contradictory—expectations of their president. They want him to follow public opinion, but they also want him to provide policy leadership. The public urges the president to adopt its preferred policy alternatives; but it blames him if those alternatives fail. The president cannot escape the dilemma. As a public servant, he must respond to public demands. What can a president do?

Building upon the insights of Richard Neustadt (*Presidential Power: The Politics of Leadership*, 1960) and Murry Edelman, *The Symbolic Uses of Politics*, (1964), Cohen theorizes

that presidents will normally attempt to protect their popularity and professional reputation by responding symbolically rather than substantively to public demands. Symbolic responses are, by no means devoid of substance, but they eschew specific commitments whenever possible. They leave presidents with room to work out details with advisers, party leaders, the cabinet, Congress, and other relevant actors and interests.

Cohen devotes most of his chapters to empirical tests of this theory. He considers four stages of policymaking: problem identification, substantive rhetoric, policy formulation, and policy legitimization. He uses State of the Union addresses from 1953 through 1989 to develop measures of problem identification and substantive rhetoric. He then employs these measures as both independent and dependent variables in regression models that relate them to problems and preferences reported in public opinion polls. He also compares presidential rhetorical liberalism to positions taken by the Americans for Democratic Action and to "public moods" as measured by Stimson (*Public Opinion in America: Moods, Cycles and Swings*, 1991) (policy formulation). Finally, he compares public mood with announced presidential positions on congressional roll calls (policy legitimization).

By and large the results affirm the theory. Presidential rhetoric is highly responsive to public opinion regarding problem identification. It is less responsive or not at all responsive regarding substantive rhetoric, policy formulation or legitimization. Cohen includes eight case studies that illustrate his results.

Whether or not to accept these results rests upon the validity of Cohen's measures. Does classifying the sentences of 33 State of the Union Addresses (and of four substitute speeches) comprise a valid operational procedure for measuring presidential responsiveness to public opinion? Is the latest Gallup poll preceding the presidential address a valid indicator of the public's policy priorities or its preferences? Cohen is the first to admit that "much policy making happens between Addresses" (p. 37), and in his case studies he makes little or no mention of them. He is also candid in admitting that he has so few cases and so many independent variables (often correlated with one another) that his multivariate equations include only the best-fitting subsets of independent variables. Statistically, however, if you try enough combinations of these variables, you are bound to find good fits here and there.

Regardless of whether they accept its conclusions, readers will find *Presidential Responsiveness* useful for its thorough summarization of previous theory regarding presidential responsiveness to public opinion and for the clear explanation of its methodology. The argument is well organized and presented straightforwardly. The author lays out his assumptions, explains his measurements, and uses regression paradigms appropriate to those measurements.

Although Cohen hurts his argument by reifying some measures of dubious validity, I am hard pressed to find a more thorough attempt to develop and test a theory of the responsiveness of the American presidency.

Muffled Echoes: Oliver North and the Politics of Public Opinion. By Amy Fried. New York: Columbia University Press, 1997. 308p. \$49.50 cloth, \$19.50 paper.

Barry J. Balleck, *Georgia Southern University*

This book raises a question that some have been wondering about for years—What is the true character of American public opinion? Today, American public opinion is most

likely to be reported by the mass media as an amalgamation of the percentage of Americans who respond to some set of predetermined and close-ended questions. There is in such reports little, if any, of the spontaneity that once marked "true" public opinion. Indeed, gone are the days of mass demonstrations, wildcat strikes, and marches on state houses and the seats of government that once were the hallmarks of American public opinion. The information that is presented as public opinion is calculated and massaged, after which "experts" offer interpretations of what they think the public thinks. In the end this process makes the public more often than not the consumers rather than the producers of public opinion.

Amy Fried contends that the reciprocal discourse between the public and elected officials has today been replaced by a mass of survey technologies and techniques which mask the real meaning behind public opinion. In effect public opinion has become a one-way process, one in which various elements of the political system—such as the media, interest groups, and political elites—manipulate and craft public opinion to serve particular political ends. This state, she contends, means that "it is less important politically what the public thinks than what the media and political elites believe the public thinks" (p. 12).

To guide her research on the current state of American public opinion, Fried draws on theories of V. O. Key and Jürgen Habermas. Key argued that public opinion exists within a "marketplace of ideas" wherein opinions are continually in competition with one another in a dynamic political environment. Public opinion, then, is but an echo in an "echo chamber," creating a situation in which there are many conflicting meanings and ideas which must be interpreted and given meaning by the existing political system. These interpretations and meanings are made possible within the context of Habermas's thought. Habermas held that expressions of public opinion are largely the product of mass culture and the ongoing historical process of a given society.

Evidence that American public opinion is but an echo in an echo chamber can be found in the case of the Iran-Contra hearings, particularly in the appearance before the joint House-Senate Investigating Committee of Lieutenant Colonel Oliver North. Common belief holds that the American public saw Oliver North as a hero in the Iran-Contra scandal—one who had become the scapegoat for the Reagan administration's policy of trading arms for hostages, and then funneling proceeds to the Contra "freedom fighters" in contravention of the Boland Amendment prohibiting such aid. North's designation as a "hero" was suggested first by President Reagan's designation of him as such, as well as the spectacle of a defiant North standing before a Congress intent on establishing his guilt. North himself was successful in perpetuating the hero myth as he was able to draw on a variety of cultural and symbolic themes shared by the collective American conscience.

Apart from Reagan's pronouncement and North's self-promotion, Fried contends that the portrayal of North as an heroic figure was largely the creation of (1) the media, which misinterpreted or disregarded public sentiments which questioned North's motivations, (2) zealous interest groups, which saw in North the opportunity to advance their political agendas, and (3) political elites, who used the spectacle of North to criticize existing policies prohibiting Contra aid. Using a variety of results from personally conducted interviews and interpretations of media reports of North's appearance before Congress, Fried concludes that, contrary to popular belief, there was not a large groundswell of public support for Oliver North and his actions. Rather, the public

was somewhat indifferent toward North, although there were expressions of admiration for him coupled with expressions of disdain for what was seen as his blatant disregard for the constitutional process. In effect, the phenomenon of Oliver North was one which was carefully orchestrated by elements of the American political system, including the mass media, vocal interest groups, and political elites—each advancing its own agenda. This orchestration was, as Murray Edelman contends, a “spectacle of public opinion.”

But how is it that these political elements could construct such opinion? Fried argues, at least in part, that the muffled opinions expressed in the echo chamber of politics left little clear guidance as to what the public's opinions were toward Oliver North. In fact, that North was quickly made into an heroic figure in the Iran-Contra scandal suggests that those elements that wished to portray him as such were better organized than those that may have had an opposing view. There were never any serious public demonstrations against North, nor was there serious questioning of his motivation in the press. Some criticism did come from members of Congress, but they carefully crafted their dissent so as not to upset what was being portrayed as a growing tide of sympathy and admiration for Oliver North and his actions. As Fried points out, much of what happened to create the spectacle of Oliver North was the result of a sort of self-censoring on the part of those in the public who may have mobilized to express their opposition to North. Due to the fact that the media and other elements were lauding North, however, these portions of the public became reticent to express themselves because of their perception that their views were in the minority. This analysis seems to be correct as Fried's research shows that there was never the overwhelming support for Oliver North that was so often reported in the media.

The book is important in that it confirms research that has been conducted for years which shows that people with intense preferences are more likely to be active in the political process. Its unique contribution, however, is in asking the question which is at the heart of such research—What are the implications for the democratic process of the crafting of American public opinion? Fried contends “that the use of public opinion today poses serious problems for democratic citizenship, leadership, and the political process” (pp. 216–7). Though not “all powerful,” the “use of public opinion” does provide a tool by which citizens, political leaders, and the political system itself can be manipulated (p. 217). If correct, Fried raises serious questions about the functioning of democracy. Indeed, the implication is that an aggressive media and determined interest groups can manipulate the public and even elected officials to such an extent so as to influence a variety of outcomes. Such is the conclusion to be drawn from the Oliver North case.

Notwithstanding these possibilities, there may be alternative explanations to the conclusions offered in the book. First, Oliver North may have been portrayed as a hero because of the perceived lack on the part of the media and other political elements of such heroes in the American political realm. In the aftermath of several foreign policy failures, it may have been refreshing to the public to see an American taking a stand against a relentless enemy—in this case Sandinista communism. More likely, though, is the possibility that cases like that of Oliver North are simply ones where the public does not choose to involve itself. In other words, it could be argued that the stakes simply were not high enough for the opposition public to become involved in the Oliver North case. Fried seems to allude to this point in her intriguing typology of the politics of public opinion found on page 199. Here, Fried seems to imply that issues which

involve strong symbolic issues (such as abortion) will mobilize an even group distribution and there will be legitimate debate and opinion in the public sphere. However, other issues will not elicit such debate and will be susceptible to influences by media-driven, interest group-driven, or elite-driven dynamics. Though it is easy to agree with Fried on the surface that Americans are uninvolved and susceptible to manipulation, it is also possible to argue that the public must pick its battles and will therefore not concern itself with what it views as peripheral issues. One need only look to the public opinion generated prior to the Gulf War to realize that the public is alert and active in political events. Still, it is impossible to deny that there exists what Noelle-Neumann calls the “spiral of silence,” wherein the public has become increasingly mute on a variety of matters. One can only conclude, then, that the multitude of issues in the public arena and the limited time available to the public makes it necessary to prioritize where each battle will be fought.

The Dual Agenda: Race and Social Welfare Policies of the Civil Rights Organizations. By Dona Cooper Hamilton and Charles V. Hamilton. New York: Columbia University Press, 1997. 335p. \$24.95 cloth, \$17.50 paper.

Todd C. Shaw, *University of Illinois, Urbana-Champaign*

From a recurring debate within African-American politics, an uneasy consensus has emerged: Even though the civil rights movement must be credited for breaking down the most overt barriers of racial discrimination, it has not ameliorated stark economic disparities. Two of the most insightful commentators on race and class in America—William J. Wilson and Harold Cruse—have forcefully endorsed this consensus, albeit from very different standpoints. Both in *The Declining Significance of Race* (1980) and *The Truly Disadvantaged* (1987), Wilson concedes that the civil rights movement has qualitatively improved the life chances of the black middle class. It has, however, left unscathed the economic morass that entraps the so-called black underclass. The problem, according to Wilson, is that civil rights leaders have been so preoccupied with “race-based” social policies, such as the “black-targeted” War on Poverty program or affirmative action, that they have fundamentally misread the political climate's greater receptivity to universal programs. Thus, in not pursuing programs like universal health insurance that benefit *all* Americans, they have missed key opportunities to build broad, winning coalitions with the middle class. In *Plural but Equal* (1987), Cruse offers an even more sanguine assessment of the civil rights leadership's myopic focus upon a “noneconomic liberalism.” Most, except Jesse Jackson, have embraced a liberal, Democratic, welfare state without likewise recognizing the imperatives of economic self-development.

With the expressed purpose of challenging this consensus, Dona Cooper Hamilton and Charles V. Hamilton assert that it is both unfair and erroneous to argue that the major civil rights organizations have not consistently stressed a “dual agenda”—civil rights *and* economic redistribution through universal social welfare policies. As a matter of fact, the authors provide exhaustive evidence that for sixty years groups such as the National Association for the Advancement of Colored People (NAACP), the National Urban League (NUL), the Southern Christian Leadership Conference (SCLC), and myriad others have been at the forefront of working for black citizenship rights and economic justice.

At issue for these organizations, as the authors explain, has always been the unequal and precarious two-tiered system of

social welfare benefits first enacted in the 1935 Social Security Act. The first and largest tier entailed an extremely popular and politically untouchable social insurance program that covered the gainfully employed. The second tier, however, was comprised of public welfare recipients whose benefits have been susceptible to retrenchment because they are stigmatized as lazy and unwilling to adhere to the work ethic. To highlight black counterproposals, Hamilton and Hamilton weave a narrative that explains why civil rights organizations pressed for (1) universal coverage that grants benefits to the employed and unemployed alike; (2) full employment; and (3) federal, as opposed to state, funding and administration. Though this work more specifically replies to Wilson than to Cruse, the authors delineate how the social policy agendas of the major civil rights organizations have gone unrecognized by their critics who are concerned about the economic plight of African Americans.

Hamilton and Hamilton must be applauded for writing a fascinating, well-conceived, painstakingly researched, and wholly readable account of the civil rights contribution to American social welfare policy from the New Deal to the New Democrats. It is evident that this book was a labor of many years during which they meticulously compiled and rigorously employed primary resources from several libraries and archives. To be sure, the "consensus" that civil rights groups are only concerned about racial matters made such rigor necessary. For the most part, I believe they have anticipated their critics by reminding some and informing many others that—from the social security, full employment, and health insurance proposals of the 1930s and 1940s to the workfare of the 1980s—civil rights organizations have consistently warned the nation of the dire consequences of not guaranteeing economic opportunities for all. As is painfully obvious from the punitive 1996 Personal Responsibility and Work Opportunity Reconciliation Act, the civil rights groups have won only a few economic battles, but they have (to invoke the biblical maxim) fought the good fight.

Having said all of the above, I believe there are points where Hamilton and Hamilton could have more effectively anticipated implicit criticisms from Wilson and Cruse. Wilson may contend that despite the embrace of a dual agenda and universalistic language, these organizations were (and are) first and foremost concerned with the plight of "the Race," and thus it is undeniable that their racial objectives shaped their social welfare stances. To respond to such a criticism, the authors should have considered whether there has been a periodicity to the dual agenda. From the 1930s to early 1960s, a virtually flat, black class distribution may have compelled these groups to see race as nearly indistinguishable from class—thus their attempt to get black agricultural and domestic workers enrolled in tier 1 when they were originally excluded from social security. Yet, from the mid-1960s to the current period, increasing black class stratification compelled these groups to pursue more aggressively race and class imperatives (e.g., affirmative action alongside the 1966 Freedom Budget). Various students of black class politics—from E. Franklin Frazier in the 1950s to Robin Kelley in the 1990s—have found that black class tensions within civil rights groups have been persistent if not predominant.

To better anticipate possible reproach from a Crusian perspective, the authors should have made their introductory chapter more than a brief rehearsal of their main points. It also should have been a discussion of where we might position the civil rights organizations in relation to various black nationalist or black socialist programs and ideals. The Hamiltons' failure to mention or discuss the disagreement W. E. B. DuBois had with the integrationist direction of the

NAACP in the 1930s was puzzling. DuBois explicitly advocated black, economic collectives or "pockets of socialism" based upon the immediate reality of Jim Crow segregation. And though the authors get at some of the internecine conflict between these civil rights groups and the communist-inspired National Negro Congress or Malcolm X and the Black Power movement, a wider examination of those within the black community who might have been critical of the civil rights groups would have demonstrated that civil rights leaders did not formulate the dual agenda in a relative vacuum; rather they were motivated by both opportunities in the policy arena and various pressures from the African-American community.

None of these comments, however, detract from my conclusion that this is an outstanding piece of scholarship that is required reading for students of the civil rights movement, American social welfare policy, and interest groups. Given the task before them, I can fully understand why Hamilton and Hamilton closely followed the social welfare consensus among civil rights organizations at the risk of excluding dissenters. I simply contend that their already rich narrative would have been richer if they could have made their "big picture" just a bit bigger.

Congressional Caucuses in National Policy Making. By Susan Webb Hammond. Baltimore, MD: Johns Hopkins University Press, 1998. 257p. \$39.95.

Burdett A. Loomis, *University of Kansas*

Over the past twenty-five years, informal groupings of representatives and senators, usually labeled caucuses, have come into existence with increasing frequency. Congressional scholars, while acknowledging their presence, have had some difficulty in coming to terms with these groups. Neither fish nor fowl, they did not fall under the domain of either the party organization or the committee system. Although they drew on the resources of individual legislators, they served the interests of a collection of lawmakers. And there was the continuing question of significance: How important could the Mushroom Caucus or the Auto Task Force be, anyway?

After two decades of tracking these work groups, Susan Webb Hammond, professor of political science at The American University, has written the essential book on congressional caucuses. Drawing on a series of data points, surveys, and extensive interviewing in the 1980s and 1990s, she has produced a definitive study, one that will serve as the baseline for any subsequent research on caucuses. Hammond places these groupings within the formal framework of legislative analysis, in terms of party strength, committee jurisdictions, and member goals, but more importantly she combines careful description of these groupings with systematic analyses of how different types of caucuses operate within the Congress to affect policymaking. Indeed, the systematic nature of her approach becomes both a major strength and a minor weakness of this volume.

Congressional Caucuses proceeds in the most regular of ways, first establishing the roots of caucus formation and membership, then developing six major categories of caucuses, and subsequently focusing on how caucuses relate to party leaders, committees, the executive, and floor action in both House and Senate. Given the ground to be covered, Hammond is never able to work up much of a coherent overall narrative, a shortcoming that derives directly from the great diversity among caucuses. There are a lot of good stories, but rarely will one capture the essence of all caucuses, or even those of a single type.

Hammond's analysis rests squarely on her classification scheme for caucuses. Based largely on extended observations of the motivations driving caucus membership, her six categories include caucuses based on party (e.g., Democratic Study Group), personal interest (e.g., Congressional Space Caucus), national constituency (e.g., Congressional Black Caucus), region (e.g., New England Caucus), state/district (e.g., Rural Caucus), and industry (e.g., Congressional Steel Caucus). Once establishing this typology, Hammond uses it to demonstrate differences among caucuses in how they become involved in national policymaking.

The most notable strength of caucuses may well be their capacity to adapt. Thus, they can work with party leaders, address issues that fall between the cracks of the committee system, and serve the particular interests of their individual members. Hammond notes that the members see "the caucus system as supplemental to, but not supplanting, the formal party and committee systems" (p. 108). And such supplementing enhances the strength of rank-and-file members. Indeed, the steady growth of caucuses from the 1970s through the 1990s demonstrates the continuing desires of virtually all members to play a role (or be seen playing one) in the policymaking process. Even in a democratized Congress, the ability of most individual members to affect policies is limited by the party and committee systems that dominate the legislative process. Caucuses offer a real, if limited, alternative, in which a legislator may have an effect dedicating some time and staff resources to collective activities. Caucuses offer not an alternative to either party or committee organization but an alternative way to affect party and committee actions—or, in some cases, the actions of the executive branch.

In the end, caucuses survive because they serve their members and they can adapt to changing circumstances on Capitol Hill. This is most aptly demonstrated in the aftermath of the 1994 elections, at the onset of Republican control of Congress. Many GOP party and committee leaders, such as House Agriculture Committee chair Pat Roberts (R-KS), distrusted caucuses and succeeded in abolishing the officially sanctioned groups known as legislative service organizations. Almost all of these groups restructured themselves and continued to exist, and in 1995–96 forty-three new caucuses were formed. Both individual caucuses and the caucus form have proven resilient.

What, then, are we to make of caucuses? However much they may look like interest groups that exist at the heart of the legislative process, Hammond argues that such an interpretation is misleading. Rather, "when members join caucuses to influence policy outcomes, they do so as representatives of citizens, not as individual citizens" (p. 224). But does such representation differ from that of a lobbyist hired by the AFL-CIO or the AARP? House members and senators represent the steel industry, the auto industry, agricultural producers, and a host of other interests, and this representation takes place at all stages (as Hammond demonstrates) of the legislative process. Interests often seek a legislator to "champion" their cause on Capitol Hill; what could be better than having an entire caucus, with ties to party leaders and various committees, working on their behalf?

By not viewing caucuses as organized interests, Hammond can interpret their effect, on balance, as fostering integration within a fragmented legislative system. Surely they do help make the entire process more coherent. But they also represent particular interests that desire specific policy outcomes. Regional caucuses want federal funding formulas written to benefit their areas; industry caucuses have clear policy goals

that often put them at odds with other interests; national constituency caucus preferences, such as those of the Congressional Black Caucus, often diverge sharply from the preferences of most House members.

Still, this is an extremely valuable book that both extends and organizes our understanding of these groups. Caucuses are here to stay, as important parts of congressional life with important consequences for national policymaking. Their relationships to the interests they represent, however, and the implications of this representation, remain open to further interpretation.

Modern Manors: Welfare Capitalism since the New Deal. By Sanford M. Jacoby. Princeton, NJ: Princeton University Press, 1997. 345p. \$35.00.

Charles Noble, *California State University, Long Beach*

As Sanford M. Jacoby's important and timely book about welfare capitalism reminds us, there are many different ways to organize the search for economic security in modern capitalist societies. Only one corresponds neatly to what we think of as the "welfare state." At one time, both liberal modernization theorists and neo-Marxists believed that all industrial democracies were being driven by the same economic, technological, demographic, and political forces to adopt the same full-employment cum social insurance cum public assistance model. To be sure, there were quite contentious debates about whether this model was emancipatory or coercive, but few disputed the idea that democratic capitalism was taking us all down the same road: toward government responsibility for the economic well-being of workers.

Clearly, the accepted wisdom was wrong. Other options have always been on the table, including private retirement, accident, and health insurance; worker-sponsored mutual-benefit societies; and employer-provided, private-benefit programs. The welfare state has turned out to be less stable than once thought, developing through crisis rather than through steady accretion. Western societies have also followed different trajectories. Because worker organizations and the state are relatively weak in the United States, and private corporations are relatively large and powerful, America has proven exceptional, lagging in the creation of universal, public-benefit programs while leading in the proliferation of private ones, in no small part because large corporations have wanted to keep unions out and government small.

Welfare capitalism has not previously gone unexamined, of course. Indeed, it would have been hard not to notice such early welfare capitalist pioneers as National Cash Register, S. C. Johnson, and Filene's, which developed innovative fringe-benefit programs that anticipated much of what government would legislate and unions would bargain over. Profit sharing, personnel administration, human relations—all were developed by companies seeking to make themselves rather than organized labor or the state the center of the worker's quest for economic security. But earlier students of the subject (e.g., Stuart D. Brandes, *American Welfare Capitalism, 1880–1994*, 1970, and David Brody, *Workers in Industrial America*, 1980) focused on the origins of the welfare capitalist movement in the late-nineteenth and early-twentieth century and its apparent demise in the 1930s. In *Modern Manors*, Jacoby, a business historian, breaks new ground, arguing that the old-style, paternalistic, and often heavy-handed welfare capitalism that died in the New Deal was replaced between the 1930s and 1960s by a new-style, corporate paternalism that emphasized persuasion and consent

rather than coercion and control. Moreover, he shows that these private efforts to attach workers to firms laid the foundations for current innovations in social policy, including today's "worker-friendly" efforts by corporations such as AT&T and Microsoft to encourage employees to look to them, rather than the government or the labor movement, for their identity and sense of security.

The empirical heart of the book is a close examination, based on a wealth of primary sources, of the evolution of labor relations and wage and benefit policies in three vanguard welfare capitalist companies: Kodak, Sears Roebuck, and Thompson Products (renamed TRW in the 1960s). Jacoby selected these three because they illustrate the shared corporate commitment to prevent unionization and secure worker loyalty as well as the range of things that firms have done to achieve these ends.

Each story is carefully documented and well told. Kodak combined generous fringe benefits, including company housing and health insurance programs, with production planning to minimize layoffs; and it sustained these efforts through the Great Depression and into the 1960s. Sears Roebuck helped invent modern personnel management to keep its sales force loyal, including the study and influence of worker attitudes and the deployment of aggressive antiunion strategies at the edge (and often beyond) of the law. Thompson Products created company unions, pressured workers, and developed elaborate human relations programs to keep organized labor at bay, bringing it into direct conflict with the National Labor Relations Board in the late 1930s and 1940s. Nevertheless, all three companies ended up in about the same place: without real unions and with elaborate personnel and benefit programs designed to keep it that way.

There is much to recommend here, both for students of business and labor and for political scientists interested in the welfare state generally. The account of why some companies became welfare capitalist leaders and others did not is handled well. As it turned out, larger, capital-intensive, highly profitable firms that managed to preserve the antiunion mentality of their founders were most likely to be in the vanguard. Jacoby also offers a wealth of evidence showing how public policy, including the enforcement (or lack thereof) of the Wagner Act and the development of supportive tax and public benefit policies, affected what corporations did for, with, and against their workers.

Modern Manors is not without problems. These three cases are exceptions to the rule, as Jacoby readily admits. More commonly, firms either failed to develop significant welfare capitalist programs or dropped them when profits, or the threat of unionization, receded. How significant, then, are the experiences of these vanguard firms? Also, Jacoby does not always make the most of his evidence. In recent years, social scientists have hotly debated the relationship between class and state in democratic capitalist societies, including the role of business and labor in the development of welfare states. Unfortunately, Jacoby does not weigh in to the debate, despite the obvious relevance of what he has uncovered. Finally, while Jacoby's distinction between old and new welfare capitalism is useful, it must be handled with care. We are well into the era of persuasion, but welfare capitalist firms still routinely punish workers who prefer unions, fire organizers, and flout labor laws. Apparently, employers have expanded their repertoire rather than replaced one method with another.

Nonetheless, having clearly laid out the problem and carefully narrated these three case histories, Jacoby provides students of the state, interest group politics, and public policy with much to mull over. And his conclusion, that the foun-

dations of the next round of social policy innovation are being laid not by welfare reformers but by corporate personnel managers and human relations experts, cannot be ignored by anyone who wants to understand where the American welfare state may be headed.

The War for America's Natural Resources. By William R. Nester. New York: St. Martin's, 1997. 256p. \$59.95 cloth, \$18.95 paper.

Evan J. Ringquist, *Florida State University*

In *The War for America's Natural Resources*, William Nester attempts to explain the dynamics of policymaking in the area of natural resources over the past 150 years. The substance of the book is contained in four chapters dealing with consumptive uses (i.e., farming, grazing, and ranching), extractive uses (e.g., mining and energy production), preservation and conservation (e.g., parks, forests, and wilderness areas), and the development of water resources, particularly in the West. To guide our way through the morass of natural resources policy, the author outlines three philosophical perspectives regarding the use of natural resources. Cornucopians believe that the earth's resources are endless and should be exploited to meet society's material needs. For cornucopians, nature is an obstacle to be overcome rather than a treasure to be preserved. Environmentalists (who include everyone from nineteenth-century transcendentalists like Thoreau to modern deep ecologists) express a more ecocentric view where nature is valued both instrumentally and intrinsically. Finally, conservationists lie somewhere between cornucopians and environmentalists. Like cornucopians, they are materialists who see the natural world as a resource to be exploited, yet this exploitation should be controlled to conserve the resource for future generations. For Nester, natural resource policy can be understood as the outcome of competition between advocates of these three perspectives.

Adequately addressing the panoply of natural resource policies and agencies is an heroic undertaking. Truth be told, however, this book experiences more failures than successes at this task. Some of the most serious problems stem from the theoretical content of the book. The discussion of the three philosophical perspectives outlined above is both informative and concise, but Nester does not use them to develop any criteria for separating good or acceptable policies from unacceptable ones. At the macro level, this means that Nester's critique of natural resources policy is without a yardstick. At the operational level, it means that the author can critique markets as the source of ecological destruction in chapter one, then call for the increased use of markets to solve the environmental problems of agriculture in chapter two (similarly, the author calls for increased use of hydroelectric power in the energy chapter, then decries the ecological consequences of large dams in the water chapter). It is possible, even likely, that tools (markets, dams, etc.) may be a problem in one area and a solution in another, but without some theoretical guidance we have no idea which is true where. Second, the author's discussion of iron triangles (the overriding theory explaining the majority of natural resources policy) is at least 25 years out of date. From Nester's conclusion, it appears as if theory development in the area of public policy ended with the publication of Leiper's *The Political Process* in 1965, and that the challenges posed to this perspective by Hugh Heclo, Paul Sabatier, Frank Baumgartner, Bryan Jones, and others never happened. A similar case could be made for Nester's use of capture theory as an explanation for policymaking in the area

of natural resources. First, most natural resources agencies (e.g., the departments of Agriculture and Interior) were always intended to be constituent agencies, so "capture" in the regulatory sense is a non sequitur. Second, the few true regulatory agencies in this policy area (e.g., the Environmental Protection Agency) are social regulatory agencies to which capture theory rarely applies.

The book also suffers from substantial deficiencies of content. While no book can cover all bases, and while substantive content is to some degree a matter of personal choice, I find it curious that the author neglects to include water markets when discussing water policy; neglects the nuclear fuel cycle, repeal of the Price-Anderson Act, and the decision of the NRC to double the length of power plant operating licenses when discussing nuclear energy; neglects below-cost timber sales when discussing the Forest Service; and spends more time talking about Reagan's strong dollar policy than the CCC or the FHA when discussing agricultural policy. More disturbing is the almost complete absence of references to recent (i.e., last fifteen years) scholarly work in the area of natural resources.

State Devolution in America: Implications for a Diverse Society. Edited by Lynn A. Staeheli, Janet E. Kodras, and Colin Flint. Thousand Oaks, CA: Sage, 1997. 286p. \$58.00 cloth, \$24.95 paper.

Sarah F. Liebschutz, *State University of New York, Brockport, and University of Rochester*

The 1994 congressional elections, resulting in Republican majorities in both houses of Congress for the first time in 42 years, were widely viewed at the time as the response to, as well as the harbinger of, sea changes in American social and political life. The "Contract with America," the legislative agenda of the Newt Gingrich-led House of Representatives, in particular, was hailed (or lamented) for its potential to affect American federalism to its core. The elections, which "elevated discussions of state restructuring from a bureaucratic issue—as in 'reinventing government'—to political philosophy" (p. xii), were the impetus for *State Devolution in America*. The book's purpose is to examine the sources, processes, and implications of the 1994 congressional elections from a geographic perspective. The book's 13 contributors—all social geographers—share the assumption that economic competitiveness and social well-being are tightly linked to geography. The geographers' perspective is spatial. It extends well beyond static and bounded space, however, viewing places, instead, as open and mutable and highly vulnerable to political decisions in Washington and to changes in the global economy. Local and regional labor markets, conditioned by long-standing institutional and economic patterns, experience transnational flows of capital and labor in different ways. The authors all make clear their anxiety about further political, economic, and social fragmentation as a consequence of the 1994 congressional elections.

The book considers separately the why, how, and what of those elections: (1) recent social and economic trends and their exploitation for partisan purposes; (2) general approaches to restructuring the scope and scale of government; and (3) policy changes initiated by the Republican congressional majority. On the whole, *State Devolution in America* focuses cleanly on these three topics within a self-conscious spatial construct.

The quality of chapters elucidating the sources of state change (Part I) is uniformly high. Robert Lake's explanation of the juncture, of disaffection among large and small

capital, and among blue- and white-collar workers in the early 1990s, and its exploitation for political gain by Republicans, sets the broad context. Data presented by Janet Kodras on poverty by place, ethnicity, family composition, and age are not new to policy analysts, but she integrates them well with an argument about the political implications of globalization. Lynn Staeheli's chapter on the linkages between social and economic change and the search for community—set against the stage-setting points by Lake and Kodras—is especially creative.

"Transforming the Political Opportunity Structure" (Part II) is less well focused on its topic. Kodras delineates three restructuring strategies—devolution, privatization, and dismantling—and succinctly summarizes key issues that, over time, have characterized the iterations of American federalism. Julian Wolpert's brief summary of tensions between public and nonprofit sectors exacerbated by federal reductions is a logical extension of points made by Kodras. Don Mitchell's discourse on the importance of the advocacy of rights of "ordinary people instead of the putative rights of capital" (p. 135), however, is basically normative and not well linked to the book's main themes.

The book's third section deals with the implications of the 1994 Republican revolution for agriculture, labor, welfare, education, and environmental policy. The authors of these chapters focus on policy formulation associated with each policy area, presenting background factors that explain legislative action as well as inaction. Brian Page, in a chapter on the Federal Agricultural Improvement and Reform (FAIR) Act of 1996, examines the trade-offs by farm size, region, and commodity, and explains why small and medium-size farmers supported FAIR despite the fact that they stand to be losers. Andrew Herod, who analyzes labor relations, and Meghan Cope, who analyzes welfare reform, use the devolution/privatization/dismantling typology developed by Kodras. It is obvious that neither Herod nor Cope approve of the Republican approaches in these respective policy areas. Herod's analysis of labor relations, however, is more objective and penetrating, particularly with respect to the paradox of attaining devolution and privatization through increased federal government intervention. Though Cope acknowledges the early stage of implementation at which she wrote, her ideology overwhelms discussion of the causes and anticipated consequences of welfare reform. She fails to acknowledge the widely held belief, even among the poor, that work is preferable to welfare, or the interesting potential "second-order devolution" institutional effects of welfare reform (see Richard P. Nathan, "The Newest Federalism for Welfare," *Rockefeller Institute Bulletin*, 1998). The best demonstration of the geographic perspective is Richard Wright's chapter, in which he discusses the context that forces the national government to respond to contradictory demands from nationalists for protectionism and from transnationalists for free flow of capital, goods, information, and labor across national borders.

The geographic perspectives of *State Devolution in America* complements but diverges from the political science perspective. The general purpose of these social geographers is to provide macrocosmic context to the events of 1994 through examination of the "shifting relationship between three principal spheres of American life: the state, capital, and civil society" (p. xxi). This approach complements the most finely honed and explicit focus of political science on political institutions, actors, and strategies. Political scientists also stress broad trends, such as increasing public distrust of government, particularly Congress (see, for example, Gary A. Jacobson, "The 1994 House Elections in Perspective," in

Midterm: The Elections of 1994 in Context, ed., Philip A. Klinker, 1996), and the rise of the Christian right (see, for example, John C. Green, "The Christian Right and the 1994 Elections: A View from the States," *PS: Political Science & Politics* 28(March 1995):5-7). But they move from these broader backdrops to emphasize the centrality of political leadership in exploiting for partisan advantage perceptions of the inability of government to deliver physical and economic security, or to reverse moral and cultural decline. The singular role of Newt Gingrich in fashioning a national strategy to demonstrate to voters "that Democrats were no longer fit to run the House and that Republicans had the ideas and the determination to take command" has been especially emphasized (see, for example, Richard E. Cohen, "Campaigning for Congress: The Echo of 1994," in *Toward the Millennium: The Elections of 1996*, ed., Larry J. Sabato, 1997, p. 167). Other factors—Democratic retirements from Republican-leaning districts and President Clinton's unpopularity—are also demonstrated by political scientists to have been critical in the 1994 congressional election outcome (Philip A. Klinker, ed., *Midterm: The Elections of 1994 in Context*, 1996).

In sum, the book's overall value—its normatively argued chapters aside—is as supplementary perspective on the congressional elections of 1994. It is not a substitute for the explicit focus of political science on the interplay among political institutions, actors, and strategies.

Presidents as Candidates: Inside the White House for the Presidential Campaign. By Kathryn Dunn Tenpas. New York: Garland, 1997. 191p. \$49.00.

Ken Goldstein, *Arizona State University*

Presidential elections may well be the most studied topic in American political science. Still, although journalists have chronicled presidential campaigns from the inside (Theodore White's *The Making of the President* series still stands out as the best of this genre), there have been few scholarly accounts of how presidential campaigns are conducted. Similarly, while much attention has been paid to the different roles that a president plays, there has been little scholarship on how incumbent presidents organize and manage their reelection campaigns.

In this study, Kathryn Dunn Tenpas addresses this question. More specifically, in studying "presidents as candidates," Tenpas sets out to learn how incumbent presidents prepare for their reelection battles; how they manage their dual roles as candidate and president; and whether reelection campaigns distract presidents and the presidency from the business of governing. Tenpas focuses her attention on the eight most recent presidents to have run for reelection, characterizing their campaigns as either "victorious" (Eisenhower, Nixon, Reagan, and Clinton); "defeated" (Carter and Bush); or "takeover" (Johnson and Ford).

In the first chapter, she describes the evolution of presidential campaigns from party-centered operations to White House-centered operations. In the succeeding chapters, she describes the composition of reelection teams, the campaign strategies used by the various presidents, the organizational structures governing the different campaigns, the relationship between president and national party committee, and the changing workloads and methods of decision making that take place once the campaign has started. Her principal conclusion is that partisan politics and the quest for reelection are taking up an increasing amount of a president's time and that "during an election year the business of governing is

overshadowed by the business of campaigning" (p. 156). In the final chapter, she argues that this current state of affairs poses serious problems for effective governance and suggests that the country would be better served if presidents would rely more on party organization for electoral assistance.

Changing gears a bit in an epilogue, Tenpas turns political consultant and provides some advice to the winner of the 2000 election on how he or she should run for reelection in 2004. The advice includes the following ten tips: (1) Don't delay planning; (2) raise as much money as possible as early as possible; (3) look like a president; (4) don't hesitate, retaliate; (5) set the agenda; (6) follow the rules; (7) don't be the campaign tactician; (8) take advantage of surrogate campaigners; (9) "the vision thing"; and (10) be lucky.

Although not necessarily incorrect, these suggestions, like many of the findings in the book, are unexceptional and are not discussed in connection with any models or theories of presidential elections or presidential behavior. In fact, the lack of any sort of framework makes it difficult for one to discern the main thrust of the project. As noted above, Tenpas describes a typology of three types of reelection campaigns: victorious, defeated, and takeover. This typology (introduced in the early pages and not mentioned again in the text) and the epilogue suggest that the book is about how reelection strategies influence electoral outcomes. If so, what do we learn by grouping cases by electoral outcome? Did victorious presidents do everything right and losers everything wrong? What was the relative effect of a president's performance as candidate? Furthermore, if the book is about the effect of different techniques of organizing and running a campaign, there is scant discussion of the fundamental factors that influence both campaign strategies and election outcomes.

The book also concerns itself with the mechanics and timing of running a campaign from the White House. Ultimately, the main empirical findings are that presidents and their staffs now devote more time and exert greater control over reelection activities, paying even more attention to the political consequences of their actions as election day nears. This basic point seems sensible enough. Moreover, it is a legitimate exercise to document such a political phenomenon. What this study lacks, however, is an analytical model or theoretical framework to guide and structure the empirical research. Finally, if change is the central thesis, more effort should have been put into describing the causes of the change.

One possibility would have been to discuss how the increasing attention to electoral goals and the increasing White House control of reelection campaigns fit with the theoretical arguments and empirical findings of Samuel Kernell's work (see *Going Public*, 1997). Are both phenomena being caused by the identical set of factors? Do reelection activities differ from the seemingly permanent campaign tactics that a president may use to rally support for his person and policies? What effect do these changes have on the role of the president and broader theories of presidential behavior? Moreover, if one is concerned about the effect that reelection motives may have on policymaking and how that effect may increase over the course of a term, it would also have been useful to sketch out some sort of general model of presidential decision making. Although the author introduces data on legislative proposals and cabinet travel, no systematic or even anecdotal evidence is presented on how reelection imperatives may have changed the direction of public policy.

Finally, the author provides no account of a systematic research design or even a description of how the data were gathered. In fact, the only description of the research method-

ities comes in a sentence in the series editor's preface. For example, the Appendix contains an impressive list of presidential staffers and strategists who were interviewed, but no other information. Elite interviews can provide extraordinarily valuable data, to be sure; however, readers need to know how subjects were chosen; how the interviews were obtained; who refused to be interviewed; what the ground rules were; and what questions were asked.

Defining the National Interest: Conflict and Change in American Foreign Policy. By Peter Trubowitz. Chicago: University of Chicago Press, 1998. 353p. \$55.00 cloth, \$18.95 paper.

William O. Chittick, *University of Georgia*

Just when the democratic peace has focused most of our attention on domestic values and institutions, Peter Trubowitz has produced a masterful book which shows that economic interests trump both values and institutions in their ability to explain changes in American foreign policy at critical junctures in our history. In the process of making his argument Trubowitz also challenges the realist notion that international structures have a uniform effect on the state. Using congressional voting patterns as a proxy for the country as a whole, Trubowitz shows how international influences affect different sections of the country differently due to uneven economic development in various regions. His analysis is based on the economic conflicts between three regions: (1) the Northeast as delineated by the Potomac, Ohio, and Upper Mississippi rivers; (2) the South, which includes Texas and Oklahoma, and (3) the West, which includes the rest of the Great Plains, the Mountain States, and the Far West.

Trubowitz organizes his story around three decades of conflict and change among these regions: the 1890s, 1930s, and 1980s. The imperialism of the 1890s is explained by Trubowitz in terms of the success of the Northeast in wooing the West from its sister agricultural region, the South. The Northeast needed new markets in Latin America and the Pacific, and they sought a "bargaining tariff" to pry more favorable trade arrangements with countries in those areas. The South opposed these bargaining arrangements because it feared that its trade with Europe might be jeopardized by America's competition with Europe in Asia and Latin America. Although the West was less dependent upon international trade than either the South or the Northeast, it had little to lose in seeking new markets abroad. As a consequence of these economic considerations, the Northeast and West also favored a strong navy and imperialist policies, whereas the South generally opposed both imperialism and expenditures for the navy.

Three decades later the Northeast had become a major center for world trade and investment. It wanted the federal government to open up new markets and prevent the continental powers in Europe from excluding those areas from the market. This time it was the South that sided with the Northeast because the South needed to maintain its trade with Europe. Both sections were eager to support the British and the French in their effort to block German control of Central Europe. Although the South was very weary of the growth of executive power during the New Deal era, it was prepared to support new executive power in foreign affairs in order to preserve its European markets. The West was less dependent on trade and was suspicious of the penchant of the Northeast to grow at its expense by garnering more and more federal dollars for military purposes. Trubowitz argues that the bipartisan consensus on foreign policy during the early

Cold War period is actually based on this regional economic alliance.

By the 1980s the new industrial areas were largely in the West and the South. Manufacturing in the Northeast was no longer very competitive, and the region needed the tariff and other restrictions on trade to protect its jobs and income. The Northeast was down and almost out. Now it was the West that favored free trade as more and more of its agricultural production was being sold abroad. Because there was more industrialization in the South, that region had mixed views on free trade. But the Republicans in the West were able to woo the South to their side by emphasizing the need for an arms build-up since both regions received the lion's share of defense expenditures. Thus a West-South coalition was formed against the Northeast.

Trubowitz does a good job showing how these sectional economic interests influence partisan politics, institutional conflicts, and the battle of ideas. He employs a series of maps, tables, and line and bar graphs to present his evidence, most of which focuses on key congressional votes on selected issues. I wish he had introduced public opinion data to fortify his position in the more recent cases. However, I don't want to quibble very much with the author of a book that is as well documented and well argued as this one.

Changing Public Sector Values. By Montgomery Van Wart. New York: Garland, 1998. 328p. \$60.00 cloth, \$24.95 paper.

John S. Robey, *University of Texas-Brownsville*

This volume is intended to provide a theoretical base for the analysis of changing values in public administration. The author examines the sources of five "value clusters": personal or individual, professional, organizational, legal, and public interest. These are the same values that make up the American Society for Public Administration's Code of Ethics.

Van Wart views individual values as manifestations of "civic integrity," which includes the "universally held" values of honesty, consistency, coherence, and reciprocity. When these four values are established in an organization, the result is a "high-trust" organizational culture. No single definition exists for "profession," but the author suggests that it is characterized by self-awareness, a body of knowledge, a social ideal, a formal organization, a national academy, and ethical standards. The volume focuses on organizational values when they are in conflict with other sources of values. Some attention is paid to organizational health, design, and leadership styles. Legal values include respect for the Constitution, for federal, state, and local laws, and for judicial rulings. The author maintains that "at a minimum the law . . . and due process constitute a baseline for competing values." He provides several definitions of public interest values and speculates as to the implications of each. It is his view that ethical decisions result from thorough consideration being given to all legitimate values.

Van Wart examines basic assumptions for public administration for each of several "value domains." This exercise generates a list of 17 basic assumptions that may be used to understand decision making in the public sector. For example, legal values lead a public administrator to be subordinate to the law, legislative intent, political bureaucrats, and judicial mandates. Public interest values lead administrators to implement public policy but not usurp the policymaking process, to be efficient with public resources, and to support the public's right to know and be involved. Individual values lead administrators to make unique civic contributions and to

have a well-developed sense of civic integrity. Professional values lead them to value training and education and to be influenced by the knowledge of the professions. The first two parts of the volume emphasize values from the perspective of individual administrators. The third part analyzes values from a cultural perspective. The author examines the role of culture from within an organization and narrows his analysis to the values of subsystems and ultimately to individuals within the subsystems. This analysis relies on the work of Schein and Ott, which divides culture into value levels, such as basic assumptions and beliefs, and tangible levels, or patterns of actions and language, art, technology, and material goods. Van Wart then uses three paradigmatic alternatives to understand the belief level of public administration. These paradigms are the "weak administrative paradigm," which places a minimal importance on independent institutional authority; the "mixed administrative model," in which the public sector's uniqueness is minimized; and the "strong administrative model," in which independent institutional authority is enhanced. These models allow the basic assumptions of public administration to be evaluated and interpreted with more clarity. Each model has strengths and weaknesses.

The author then directs his attention to the selection of decision-making processes, with some emphasis on rationality. This leads to the development of a three-tiered typology of rationality: cognitively oriented, noncognitively oriented, and politically oriented. Cognitively oriented rationality includes rational choice, and competition leads to efficiency. Noncognitively oriented rationality includes tradition, and customs lead to consistency with the past. Politically oriented rationality includes elitism, and aristocratic means lead to support from key groups within the society. The author selects reasoned choice models for some emphasis and integrates culture values with operational decision-making values.

Van Wart notes that public administration is undergoing a

mammoth transformation as the values of the New Deal and the Great Society give way to changes in modern management techniques and a redefinition of the pursuit of happiness. In the concluding chapter he ties together his basic assumptions, types of rationality, the science of values, and the importance of these concepts for public administration.

The volume addresses an important aspect of public administration. That is, how do we determine what is ethical behavior in a time of dynamic change and competing sets of values? The categorizations and precise use of definitions by the author minimize misunderstanding. Van Wart both clarifies and simplifies the analysis of value choices confronting public administrators. His treatment of ethics is in the tradition of Terry Cooper, Hal Gortner, and John Rohr. But the underlying significance of the work is that it goes beyond ethics and comprehensively examines the broader field of values. This perspective leads the author to discuss the literature from various academic fields (e.g., philosophy and anthropology) and schools of thought that sheds new light on the study of values and ethics.

Van Wart builds a logical and systematic rationale for the scientific study of public sector values. The volume seems at times unnecessarily wordy and obtuse, but the author is dealing with abstract categorizations that do not lend themselves easily to simplistic explanation. It is a thoughtful work that delves deeply into the subject matter. The book is intended for scholars and practitioners of public administration, but it also may find an audience in students of ethics, philosophy, and the social sciences in general.

The author is to be commended for presenting us with a provoking synthesis of the dynamics of various streams of thought relating to values and ethics in the public sector. His work is a valuable addition to the literature and a good first step toward his goal of "creating a field of public administration values."

Comparative Politics

State, Nation and Ethnicity in Contemporary South Asia. By Ishtiaq Ahmed. London and New York: Pinter, 1996. 326p. \$110.00.

Ted Robert Gurr, *University of Maryland, College Park*

The new literature on ethnopolitics includes a growing number of regional comparative studies, but most are edited collections of case studies in which a common outline or framework is used as a weak substitute for theoretically relevant comparative analysis. It is also uncommon to find either case or comparative studies of ethnopolitics that are grounded in the general theoretical literature. The book under review is an important exception. Ishtiaq Ahmed, a Pakistani-born political scientist who has spent his academic career at Stockholm University, has written an impressive synthesis of South Asian and Western scholarship on the accomplishments and contradictions of the state-building project in India, Pakistan, Bangladesh, and Sri Lanka. Though he relies primarily on secondary sources, he also draws on extensive interviews with leaders of separatist parties and movements throughout the region.

Ahmed begins with an incisive review of theoretical issues in the literature on ethnic identity, nationalism, and the nature of state-society relations. This provides the point of departure for the core of his own analysis of communal and

regional conflicts in South Asia. The essence of a complex argument is that state and society in the postcolonial South Asian states were weakly linked. The first generation of leaders were committed to secular, democratic principles but at the same time had to ensure the survival of new states in multicultural societies with disparate, often competing and mutually hostile identities and interests. The establishment of viable states in this situation meant achieving two main objectives by state action: economic growth and consolidation of state control over disparate cultural entities. The specifics of the policies adopted toward these ends differed among the states, but there were some common consequences. In the 1950s and early 1960s the "nation-state project," as Ahmed characterizes it, achieved a number of gains. But as the scope of state action expanded, modernization had differential effects on social and cultural groups, and the political process became unduly influenced or corrupted by particularistic and communal interests.

Beginning in the late 1960s, but mainly from the late 1970s onward, a number of separatist and communal challenges were mounted, affecting all states in the region. Many of these Ahmed characterizes as "separatist projects," including those that mobilized the Muslims of East Bengal and Kashmir, the Sikhs in Punjab, the Tamils in Sri Lanka, the tribal peoples of the Chittagong Hills in Bangladesh, and the Sindhis and Mohajirs in Pakistan. Most of these groups had supported regionally based parties, such as the Awami

League in East Pakistan and the Akali Dal in Punjab. With the radicalization of communal politics after the late 1960s, some of these parties shifted from the politics of group representation to campaigns for regional autonomy or independence. Most militant movements and leaders, though, emerged outside of and in opposition to conventional parties; examples are the Tamil Tigers (1976), Bhindranwale's violent campaign for an independent Khalistan (1978), and in Pakistan the Mohajir Quomi Movement (MQM, 1984).

Ahmed's analysis shows how policies of the central state contributed repeatedly and in diverse ways to the emergence and radicalization of communal politics. In some instances states pursued overtly discriminatory policies, such as the "Sinhala Only" legislation introduced in 1956 in bilingual Sri Lanka. In India the interests and electoral victories of regional parties in Kashmir and Punjab were sacrificed to the machinations of a Congress Party determined to maintain power at the center. In Bangladesh the Chakma peoples of the Chittagong Hills have lost their historic autonomy to the center and their land and resources to Bengali settlers from the lowlands. The reader is drawn inevitably to the conclusion that central governments have been principally responsible for the communalization of South Asian politics: Most separatist projects were at their outset reactive, not proactive, and they escalated from conventional politics to violent resistance in response to misguided state efforts to manage conflict.

Sectarian cleavages characterize some South Asian conflicts, but most of the potential separatists are distinguished from those who control central state power by language and separate historical status, not religion. Religiously based challenges are exemplified by militant Hinduism in India (the Bharatiya Janata Party), militant Islam in Pakistan, and militant Buddhism in Sri Lanka (the Janata Vimukti Peramnua movement). Unlike the separatists who seek substate autonomy or sovereign statehood, these sectarian movements aim at controlling the center, or at least at imposing cultural orthodoxy on heterogeneous societies. In both Pakistan and Sri Lanka sectarians have largely succeeded: Pakistan has largely abandoned the moderate principles of the founding Muslim League to become a theocratic Islamic state, while the Sri Lankan state has given primacy to Sinhalese Buddhist language and culture at the expense of Tamil Hindu culture. In India Hindu nationalists are on the verge of power at the center but, because of the exigencies of coalition-building, have substantially trimmed their position with regard to the status of India's 12% Muslim minority.

It is evident from these examples that religious minorities in South Asia are under pressure mainly because of the efforts of (some elements of) dominant groups to establish the hegemony of their culture and belief system. In Pakistan the pressures are especially severe for the non-Muslims (mainly Christians and Hindus), the Ahmadiyya sect, and Shi'is. The most serious contemporary challenges in Pakistan are not sectarian, however. They arise from communal competition for regional political and economic hegemony. The Mujahirs, descendants of Urdu-speaking Muslim immigrants from Punjab, have come to dominate the urban centers of the province of Sindh, above all Karachi. Resentment against their advantages has prompted a strong Sindhi separatist movement. But the Bhutto family is also Sindhi, and when in power it has promoted Sindhi interests at the expense of the Mujahirs. In reaction, some Mujahirs support a rival separatist project pursued by the terrorist MQM movement.

International factors are implicated in separatist and communal conflicts throughout the region, as Ahmed makes clear

in both the country studies and an excellent concluding chapter. The conditioning factor is the psychological legacy of partition in 1947 and the massacres and population displacement that followed. It is manifest in mutual insecurity of the Pakistani and Indian politics and Pakistan. It motivated Indian intervention in East Bengal in 1971, Pakistani training of Muslim Kashmiri separatists, and clandestine Indian support for opposition communal groups in Pakistan.

In summary, Ishtiaq Ahmed has written an impressive comparative analysis of state-building and separatism in a region on which the social science literature is overwhelmingly descriptive. The conclusion builds on and synthesizes the historical and case study evidence to show how state-led modernization and uneven development have led to the reemergence of communal identities throughout South Asia and to separatist movements based on those identities. These movements have deep cultural and historical roots but are not "primordial"; rather, they are a political response to state-promoted political and economic change. In response to these movements all states in the region have in varying degrees relied on force to maintain control and have compromised or abandoned the secular and democratic principles of the first generation of postcolonial leaders.

Ahmed concludes his analysis with recommendations for peaceful resolution of communal conflicts in South Asia. At the international level he calls for engagement by worldwide movements concerned with human rights and points out the vital importance of mitigating the India-Pakistan rivalry. He rejects particularistic ethnic solutions based on redrawing the political map of the region and argues instead for power sharing and regional autonomy within existing boundaries. "A greater share in development coupled with cultural and regional autonomy appears to be the only formula that can create stability and peace within the states and in the South Asian region" (p. 299). The emerging middle classes are potentially a major local force for what Ahmed calls "humane development," including a concerted political effort to reduce state reliance on coercion and to address inequities across communal, class, and gender lines. The vision is grand, and the analysis from which it derives is careful, detailed, and on the whole convincing. *State, Nation and Ethnicity in Contemporary South Asia* is, in sum, a major contribution to the literature on modernization and the resurgence of communal challenges in the global South. And it should stand on its own as a text for courses in South Asian politics.

Democracy and the Marketplace of Ideas: Communication and Government in Sweden and the United States. By Erik Asard and W. Lance Bennet. Cambridge, UK: Cambridge University Press. 243p. \$59.95 cloth, \$18.95 paper.

Jan-Erik Lane, *University of Geneva*

Can one do imaginative political theory without using rational choice? The hard-core rational choice scholars in our discipline would, of course, flatly answer "no." They should take a look at this little book, which theorizes about the present predicament of popular government in two entirely different countries in terms of size, institutions, and political behavior. Asard and Bennet present a beautiful exploration

of the relationship between politicians/parties and the electorate in the 1990s without all the paraphernalia of noncooperative game theory. The result is a most stimulating analysis of the malaise of democracy today.

Despite all their differences, American and Swedish democracy suffer from the same problem: voter dissatisfaction, expressed in electoral volatility if not apathy, with political elites becoming increasingly myopic and opportunistic in their communication with the electorate. Asard and Bennet suggest a new interpretation of these facts by building an intuitive model that combines political communication concepts with neoinstitutional notions. How do they explain the rise of voter individualism and elite cynicism in two such different institutional environments as the gigantic United States and tiny Sweden?

Political institutions, the book argues, are open to invasion from cynical forces when the communication between voters and the politicians/parties is no longer focused upon major ideas but degenerates into media manipulation. Two such major ideas were the New Deal and the so-called Folkhemmet, which canalized the political efforts of people for decades in the two countries, giving clear-cut meaning to electoral combats and legislative work. Since these major ideas have declined in relevance and nothing similar seems to be forthcoming, the authors look for remedy in institutional reform. Thus, for the American liberal democracy, they wish to stem the role of money in U.S. electoral campaigns, limit political advertising on television to make it more equitable, reform the journalistic profession, and finally have PR introduced in the election system. For the Swedish welfare state democracy, they suggest restricting the number of national parties but increasing the number of local government politicians, strengthening the famous system of public enquiries to foster intelligent policymaking, and regulating the use or abuse of political information in the mass media.

If something critical should be stated about this brilliant book, then I would focus upon the "ought" and not the "is." For students who seek a succinct analysis of the politics of the New Deal or the Folkhemmet, this book is worth consulting. But the recommendations seem contradictory and statist in tone. Perhaps government is no longer so powerful that it can accomplish these reforms? Maybe that is the reason the New Deal and Folkhemmet ideas are no longer relevant? I would look for the remedies in more political decentralization and a more vibrant civil society, à la Tocqueville, especially with regard to still very socialist Sweden.

Tethered Deer: Government and Economy in a Chinese County. By Marc Blecher and Vivienne Shue. Stanford, CA: Stanford University Press, 1996. 265p. \$39.50.

Dali L. Yang, *University of Chicago*

The research for this book started in the late 1970s when China finally opened to American social scientists for field research and the authors sought to bridge the chasm between elite-centered analysis and studies of grass-roots politics, two trends then prevailing in scholarly research on China. Accordingly, the authors chose to focus on a Chinese county in order to examine how it related to upper levels of the state on the one hand and local governments and society on the other. Shulu (Tethered Deer; renamed Xinji municipality in 1986), the county that became the case for research, is located on the north China plain and not exceptionally advanced politically and economically. It remained more collectivist than many coastal cities as of 1990. The authors observe that

Shulu's "conservatism" was related to its history as a Communist Party stronghold during the Chinese Civil War.

Based on extended field visits made over a decade, the authors have produced a dynamic and variegated portrait of the political economy of Shulu, with insightful comparisons between the late Mao period (1970–78) and the first decade of the post-Mao reforms (1979–90). After an overview of the historical and material settings, the authors present information about the county government and then analyze Shulu's financial structures and relations. They find a highly diverse array of ownership patterns and financial relationships. This is followed by separate chapters on the county government's role in industrialization, commercial development, and urban as well as rural development. In all these policy arenas, state involvement has persisted in the reform era and in some cases, such as the industrial economy, the role of the state has expanded. For leaders in Shulu, the authors point out, it is natural that the state should play a dominant role.

The most striking trend about the Shulu county government was the "unprecedentedly rapid expansion and elaboration" of the bureaucracy over the 1980s (p. 29). As the number of bureaus expanded and county-level bureaus established branch offices, the number of administrative personnel also grew rapidly. Ironically, the state expanded even while more and more socioeconomic activities took place outside state planning. In contrast to the currently fashionable Chinese official policy of government downsizing, the authors explain that the government expansion was neither surprising nor excessive because the state was taking "a much more active role in monitoring and regulating both the obviously beneficial and also the potentially disruptive activities of this burgeoning arena of unplanned endeavor" (p. 32).

In line with the conventional literature, the authors find that the county government was not so much bound to the hierarchical political system as it is tethered to it. While local leaders pay heed to directives and regulations coming from above, they nevertheless find ways to adapt them to local conditions. There is definitely room for local initiative and maneuver, even during the late Mao era. Indeed, the authors argue that the most noticeable role the Shulu county government has played is that of "the developmental state."

The concept of the developmental state may serve as a convenient shorthand, but the authors' use of that concept raises important questions. Implicit in their use of the concept is the notion that "the state itself does not seek to make profits, but rather to create the conditions for enterprises to do so" (p. 209). They claim that the Shulu county government as well as individual leaders have fostered conditions conducive to growth and entrepreneurship but have nevertheless refrained from getting into profit-seeking activities itself. One major case the authors cite is the Hebei Yiji Market, a marketplace set up by the county government to facilitate trade and strengthen regulation. The authors claim that the Shulu government undertook the entire Hebei Yiji project on a nonprofit basis and did not use it to make money (p. 139).

I find such an interpretation questionable, especially because the authors' fascinating discussion of Shulu's fiscal affairs mention that budget expenditures grew twice as much as budgetary revenues. This fiscal situation would provide much impetus for the county to seek new sources of revenue, much of which went into the extra-budgetary accounts. The authors mention elsewhere that many new and revived taxes came into being and Shulu officials both at the county and township levels tightened tax collection (p. 60). Leaving aside the fact that the county government continues to own a significant number of enterprises (thus making the county

government a major player in entrepreneurial activities), the Yiji case would prompt the following questions: Did not the Yiji facilitate the collection of management fees, taxes, and other surcharges and thus enhance revenue generation? Did not the government sell parts of the real estate to shopkeepers and thereby make some money? Did the commerce people see their bonuses rise as the Yiji flourished? If the answers to these questions are affirmative, then it is highly likely that the county government was not just developmental but also entrepreneurial and perhaps even rent-seeking.

It appears that the authors' conclusions were influenced by the way they conducted their fieldwork. They relied on briefings with government officials and collection of official statistics and "had only the most limited contact with the people of Shulu county" (p. 11). Needless to say, government officials emphasized the good side of government and avoided discussions of leadership conflicts and cadre corruption. In contrast, other studies that relied on grassroots interviews have tended to find the state to be rent-seeking and even predatory. The truth is probably somewhere in between and most likely varies significantly across time and space.

All in all, this admirable study sheds much light on complexities of the Chinese state, state-society relations, and central-local relations. Because this study focuses on one county (case), it necessarily leaves inconclusive answers to some questions. Yet, the care with which the authors have conducted this research means that this will be the study later research on intermediate levels of government in China must take into account and be compared to. More such case studies in China will also allow for comparisons across space so that we can better assess the determinants of government performance and state-society relations.

Desenvolvimento: Politics and Economy in Brazil. By Wilber Albert Chaffee. Boulder, CO: Lynne Rienner, 1998. 231p. \$49.95.

Elizabeth McQuerry, *Federal Reserve Bank of Atlanta*

Looking at the case of Brazil across a period spanning military dictatorship to elected civilian government, Chaffee tests the hypothesis that improved economic growth is correlated with popular political support. He argues that there is a positive association in Brazil and that successive administrations have avoided the hard choices necessary to combat inflation because such steps would have undermined their political support base. In Brazil this association was internalized by politicians through a particularized notion of *desenvolvimento*, or development, that was once popular in the leading Latin American economies.

Chaffee correctly identifies inflation as a key factor in the equation between political support and the economy in Brazil. Substantial price increases were a constant and defining characteristic from the 1940s to mid-1994, when the inflation-fighting Real Plan was introduced. The bulk of the analysis focuses on how various political decisions have derailed well-intentioned economic plans that, lacking political interference, might otherwise have attacked inflation and thereby improved the economic outlook: "Stabilization efforts have died because no sector of the economy is willing to pay the cost. . . . The basic problem is one of coordination. And a preference for current public goods over future public goods both contributes to and results from the failure of coordination" (p. 24).

Chaffee's analysis places the failure to lower inflation squarely if not solely on government. Indeed, successive administrations have made choices that undermined their

own economic programs and served to aggravate rather than contain inflation. Such a focus may be too narrow, however. Although government (and its component actors) is the ultimate arbitrator of economic policy design, it has not been the only obstacle to lowering inflation in Brazil. Private sector actors, most especially the financial sector, possessed the means to hedge against or even benefit from inflation through dollar accounts and overnight accounts. Put another way, neither the general population nor nongovernmental elites provided incentives for politicians to make the difficult decisions necessary to halt inflation. As well, contrary to Chaffee's assertion that business and financial elites "strongly supported" privatization (p. 25), the private sector has not uniformly supported opening up Brazil's economy, and liberalizing policies have often encountered the opposition of business sectors that would lose their privileged position in an open economy.

The chapters do a very good job of describing the predominant political scenario in Brazil. Low party cohesion promotes rent-seeking behavior on the part of political actors, and the pursuit of political profit often interferes with responsible policy selection. Lacking in this discussion, however, is a thorough exploration of how these preferences are formed and exercised.

Chaffee devotes very little space to discussing his data and methods, but he does complement the short statistical findings with extensive descriptions of preferences and economic policy choices in varying administrations. His own review of the data finds "a highly significant, strongly negative association between economic conditions and public support of the government. Evidence is strong that changes in economic conditions result in alterations in public support of an incumbent" (pp. 109–10). While the assertion that political regimes seek public approval is an intuitive one, it demands empirical testing. Yet, this analysis did not delve below the surface of public opinion data to explore important questions, such as the effect of popular mobilization against military rule in Brazil. The arguments would also have been enhanced by the inclusion of some theoretical discussion of why, as in the Brazilian case, military dictatorships needed to implement economic policies designed to curry popular support.

Unfortunately, the analysis rarely mentions the role of institutions (and institutional representatives) in shaping or determining political and economic outcomes. This omission is curious, given the author's proposition that the political imperative of economic growth in Brazil fueled an adherence to the doctrine of *desenvolvimentismo* (developmentalism), a concept that relied heavily on the creation and use of state agencies to carry out ambitious development plans. In Brazil, influential public and private sector institutions have played key roles in shaping economic policy and in postponing the adoption of policies to reduce inflation and lower deficits. The bureaucrats running these agencies have, in many cases, been fairly isolated from direct pressures from politicians and even from members of the administration. The relative absence of institutions is especially notable in Chaffee's analysis because he relies on Kathryn Sikkink's description of developmentalism, which posits a strong role for the state (*Ideas and Institutions: Developmentalism in Brazil and Argentina*, 1991).

Chaffee frequently refers to the twin challenges facing Brazil today: fiscal and political reform. He argues, quite correctly, that genuine, sustainable fiscal reform is not possible without taking away the incentive structure for politicians (which he calls "political profit control") to obfuscate or postpone efforts to stabilize government accounts. This im-

portant argument is never fully developed. A thorough exploration of how politicians use legislation and government funding to advance their political bases could supplement the book's basic argument that economic growth translates into political support.

Ultimately, this book's contribution to the literature on economic policy and politics is limited because it attempts to place too many complicated variables into a neat box. Although the effort to further our understanding of "macro-politics," or "the aggregate politics of politicians involved with the decisions about public goods" (p. 3), is valuable and much needed, this book falls short of its goals. The statistical treatment of polling data will interest many, yet it would have been interesting to see it used more extensively (along with a discussion of the drawbacks of using public opinion data, especially in politically repressive environments). Nevertheless, the rich detail in the description of the policy environment will make the book a useful addition to comparative politics and modern political economy courses that treat Brazil as one of several case studies.

Hot Coal, Cold Steel: Russian and Ukrainian Workers from the End of the Soviet Union to the Post-Communist Transformations. By Stephen Crowley. Ann Arbor: University of Michigan Press. 277p. \$42.50.

Lisa A. Baglione, *St. Joseph's University*

Stephen Crowley has written an excellent book on worker activism in Soviet and post-Soviet politics. He examines two sets of puzzles: worker behavior and the attitude of laborers. To solve them, he advances our theoretical understanding of grassroots and postcommunist politics.

Crowley's concern with worker quiescence may appear surprising to the nonspecialist. Did not the coal miners bring down the Soviet government, and have they not continued to strike in the post-Soviet period? While noting the importance of those strikes, Crowley is intrigued with the inactivity of steelworkers (and others) in the Soviet era and the relative dearth of strikes considering the level of deprivation workers have experienced since 1991. Moreover, the steelworkers' willingness to keep working while the miners walked off the job is remarkable because the two were literally next-door neighbors. The author resolves this puzzle with his "mutual dependence" argument. Previous models of the Soviet political economy (i.e., totalitarian, civil society, and social contract approaches) are inadequate, argues Crowley. The system was one of shortage; enterprises suffered from insufficient supplies of raw materials, well-functioning machines, and workers. Since management depended on its workers to fulfill the plan and labor was in short supply, workers had power in the workplace, but it was limited. On the output side of the shortage economy, there were too few goods available for consumption. Enterprise officials doled out provisions, and they rewarded hard or specially trained workers with more or better goods. Thus, workers needed scarce products from the enterprise, and the distribution policy helped keep labor divided.

As Soviet economic problems began to mount, workers saw their wages dwindle and goods disappear from store shelves. Under these conditions, benefits became increasingly important, and mutual dependence was a significant obstacle to activism. Steelworkers received a large proportion of their remuneration in the form of in-kind benefits. To have struck or challenged the system would have risked not only their salaries but also these benefits. Moreover, in the post-Soviet period, losing one's job means not only the loss of pay but

also the loss of these extras. New jobs that guarantee benefits are hard to find, and even if workers find new employment, they are at the end of the line for the distribution of necessities like apartments. Thus, mutual dependence has served to link steelworkers to their enterprises and to eschew strikes. Unlike other workers, coal miners earned a very high money wage and few benefits. As the economy deteriorated, salaries were not enough to protect them from hardship. Mutual dependence was low, and the miners struck as a rational response to the erosion of living conditions.

But why did the miners' demands shift from economic to political ones, and why did they initially support liberalism and then abandon that position? Crowley argues that miners were seeking a way to destroy the countrywide redistribution system that asserted so much control over their lives. They hoped for the dissolution of the USSR so that the fruits of their labor would remain closer to home. Shortly thereafter, miners became market advocates because they concluded that communism was the fundamental source of their exploitation. Although they were completely disgusted with socialism, their values were imbued with socialist principles. Miners believed that the market would produce justice, which in their minds meant that wage rates would follow from the labor theory of value and that workers would be owners. When these expectations were not met, miners became disillusioned, turning away from the reformers. But where could they turn? The party system did not offer any attractive alternatives, and workers remained allergic to the word "socialist" or the concept of social democracy. Thus, they cast protest ballots for the communists (who abandoned class-based politics) and the extreme Right.

For several reasons, Crowley's book is outstanding. First, the study is carefully designed to allow for a number of relevant comparisons: across industrial sectors (coal and steel), time (before the break up of the USSR and after), and place (in the Russian Kuzbass and Ukrainian Donbass regions). Second, his work is theoretically innovative. Building on the literature on the political economy of Soviet-style systems, he develops the mutual dependence framework. To understand the transformation in miners' demands, Crowley looks to social movement theory. (Here, he is especially indebted to those who stress the importance of culture, among them Jack A. Goldstone, "Ideology, Cultural Frameworks, and the Process of Revolution," *Theory and Society* 20 [May 1991]:405-53, and Sidney Tarrow, *Power in Movement*, 1994). Thus, he develops his argument from two seemingly opposing social science paradigms—rational choice and cultural analyses. Crowley convincingly defends this approach as appropriately suited to answering two different kinds of questions, one concerned with behavior and the other with beliefs. Third, the database for this study is extensive, and the collection effort is an impressive feat.

Crowley is telling an important story. The coal miners were at the vanguard of the movement to bring down both the state and communism. Moreover, industrial workers still comprise the largest segment of the post-Soviet population. While their dependence has allowed for the relatively peaceful building of capitalism, it does not necessarily bode well for democracy. Today, workers have no party or other organization that represents their interests in this system. Some nondemocratic group could tap into their disillusionment and ride a wave of worker support to power. Thus, post-Soviet democracy remains uncertain, and Crowley's study of workers is required reading for anyone seeking to understand politics in transition and the obstacles to activism in post-communist settings.

Mr. Smith Goes to Ottawa: Life in the House of Commons.
By David C. Docherty. Vancouver: UBC Press, 1997. 295p.
\$75.00 cloth, \$24.95 paper.

Herman Bakvis, *Dalhousie University*

Reelection rates to the U.S. Congress that typically are well in excess of 90% are seen by many as a major shortcoming, allegedly making legislators less responsive to citizen demands and limiting the opportunity for institutional change. Yet, in lamenting this state of affairs, critics tend to pay less attention to the other side of the coin, that is, the consequences associated with a relatively high turnover of legislators. In *Mr. Smith Goes to Ottawa*, on the Canadian House of Commons, Docherty presents just such a case. In Canada, turnover rates of 30–40% are not atypical, even when the incumbent government is successfully reelected. In the 1993 election year the exit rate of MPs reached 66%, with well over half the departures the result of electoral defeat. The outcome can be a legislature populated with political “amateurs,” “politicians who come to national office without the benefit of any prior elected experience” (p. 40). One important consequence is the domination of these amateurs, and the legislative process as a whole, by a small group of experienced party leaders.

Canadian exceptionalism with respect to relatively low rates of reelection and executive dominance of the House of Commons is of long standing. It is an issue that has been discussed in a number of studies (e.g., Franks, *The Canadian Parliament*, 1987; Ward, *The Canadian House of Commons*, 1950), and this research builds on and extends previous work. Docherty makes contributions in three areas. First, through detailed surveys and open-ended interviews, using a substantial sample of candidates and MPs over two electoral periods, he provides what is likely the definitive portrait of the behavior and orientations of Canadian MPs. Essentially, in examining Canadian legislators and their behavior, Docherty has done for Canada what Richard Fenno (*Home Style*, 1978) did for the United States and Bruce Cain et al. (*The Personal Vote*, 1987) for Great Britain. Second, in probing incentive structures in the Canadian parliament he makes an important contribution to the neoinstitutionalism literature, demonstrating how rules and institutions can powerfully reshape and transform the attitudes and behavior of a whole new generation of MPs. Third, by relying on the results of what can best be described as a unique natural experiment, the author is able to bring compelling evidence to bear on his arguments.

Specifically, the natural experiment arose in the aftermath of the 1993 election, when not only two-thirds of the seats in the House changed hands but also a coterie of MPs arrived who were committed to changing the traditional norms concerning the role of parties in the House in general and the norms related to party discipline in particular. The 54-member Bloc Québécois departed from traditional norms simply by virtue of their commitment to taking Quebec out of the Canadian federation. The 52-member Reform (up from one seat in the previous parliament), while committed to Canadian unity, was equally revolutionary in arguing that MPs ought to vote on the basis of constituents' wishes, not on the basis of party affiliation. It thereby attacked a fundamental tenet of Westminster-style government, namely, that governments are sustained and opposed in the House of Commons on the basis of collective support by party members. Furthermore, a sizable proportion of incoming Liberal MPs of the newly elected majority government expressed strong misgivings about having to follow the dictates of party discipline. In brief, 74% of MPs of the 35th parliament

brought with them to Ottawa a view distinctly at odds with traditional understandings of party government: They intended to follow “the wishes of the constituency over all else” (p. 145); in the previous parliament only 30% were so inclined. Nonetheless, after two and one-half years working in the House, less than 60% of the 35th parliament still felt that way.

The change in attitudes, according to Docherty, can be attributed primarily to the perceived structure of incentives inherent in the Canadian parliament and to the active intervention by party leaders. Loyalty to the party leader is seen to be far more important than policy or legislative expertise. This holds particularly true for government members, who are expected to support measures developed and introduced in the House by the executive and to desist from moving changes to bills that are at the committee stage. Even in caucus, when members ostensibly can speak their mind to party leaders, the potential for influence is limited. The inexperience of new members makes them particularly susceptible to the authority of the leadership. Party leaders (including the prime minister) are selected in party conventions in which the parliamentary caucus plays only a limited role. Members of the cabinet and of the shadow cabinet, in the case of the opposition, are appointed by the prime minister and leader of the opposition, respectively. Hence, MPs have relatively little leverage vis-à-vis the party leadership, unlike other Westminster systems, in which party leaders are often directly elected by the parliamentary party. Those MPs tempted to sit as independents are confronted with almost certain defeat in the next election, given the overwhelming importance of party and party leadership as determinants of electoral behavior, and they have an extremely circumscribed role during their remaining time in the House.

Yet, according to Docherty, there is more than simply brute force and an imbalance in resources between members and party leaders. MPs also come to recognize and accept the legitimacy of the logic underpinning the need for party discipline and loyalty to the “team.” In the case of those initially wishing to act as delegates of their constituency, MPs discover that ascertaining a consensus among constituency views is a tricky task at best, a dangerous game at worst. Careerists, defined as those with at least two elections under their belt, are much less inclined to believe that relaxing party discipline would lead to an increase in a personal vote (15% versus 54% for first-term “apprentices” [p. 220]). Thus, over time, party discipline is seen as much less a hindrance in representing constituents' interests and more an element of protection for MPs and a measure of mutual respect for fellow party members in the House.

The arguments in the book are carefully constructed. The chapters on arrival, coming to terms with parliamentary norms, and exit take us through the life cycle of the typical MP's career, discussing issues such as the nature of representation and gender differences in its conceptualization and reassessing conventional wisdom in a number of areas. The author notes, for example, that incumbents are caught in a double-bind: “A failure to engage in district work can kill members politically, but devoting more time to it might not make a difference at the polls” (p. 211). At the same time, while the effects of a personal vote in Canada are discounted by most studies, Docherty notes that incumbents who manage to survive at least two elections do significantly better than nonincumbents. In other words, at a certain point, the benefits of constituency work do kick in, and incumbents can more easily distance themselves from the party and its leadership and rely more on their personal following. Ironi-

cally, these two-term MPs are also less likely to express a willingness to buck the party.

The author has an excellent grasp of the material, although his literature review is probably too detailed, betraying the dissertation origins of the book. While focused on Canada, profitable comparisons are drawn with other legislative systems. Overall, this is one of the best recent books on Canadian politics and a significant contribution to the field of comparative legislative studies. If there is a limitation, it lies perhaps with the extensive reliance on surveys with MPs and candidates. First, as Docherty admits at the outset, the response rate by Bloc Québécois MPs to the surveys was extremely low, so that this highly ideological nationalist party is effectively excluded from the analysis. Second, in focusing on the parliamentary incentive structure as perceived by MPs, the author neglects the broader exogenous forces shaping the overall logic of parliamentary government in Canada. The country's linguistic cleavage and the strength of provincial governments tends to lead the national government to curb internal party dissent for fear of giving Quebec in particular but also other provincial governments opportunities for exploiting perceived weaknesses in the government's position. Also, the schizophrenic character of Canadian parties means they have little control over the candidate selection process at the constituency level, so the party leadership compensates in part by resorting to more stringent measures to ensure reasonable coherence of the party in parliament.

Finally, one of the more important themes of the book concerns the convergence among, and ultimately integration of, members of all parties into the norms of Canada's central governing institutions. This evolution is seen by Docherty by and large as a positive development, providing stability and continuity but still allowing for incremental change. Yet, while there may be a convergence among MPs, no such development appears to be occurring between MPs and citizens, a gap Docherty's otherwise fine book does not really address. Surveys of public attitudes toward parties and the role of MPs indicate not only that a majority believes the rule of party discipline and related norms ought to be eliminated but also that the gulf between citizens and MPs on these issues is growing. (See André Blais and Elizabeth Gidengil, *Making Representative Democracy Work: The View of Canadians*, 1991). While the public's expectations of elected representatives stress responsiveness to local concerns and a capacity to affect policies between elections, in good part a function of values that have flowed northward from the United States, the role of MPs in the House of Commons is shaped almost exclusively by Westminster parliamentary norms, reinforced by the factors noted above, so as to make it even more executive and party dominated than its present British counterpart. It is this gulf between the Canadian parliament and the broader context in which it operates that remains one of the more profound challenges facing the Canadian polity.

Principles of Electoral Reform. By Michael Dummett. Oxford, UK: Oxford University Press, 1997. 189p. \$65.00.

Electoral Change since 1945. By Pippa Norris. Oxford, UK: Blackwell, 1997. 254p. \$59.95 cloth, \$21.95 paper.

Vernon Bogdanor, *Brasenose College, Oxford University*

Michael Dummett is a leading philosopher and logician of his generation, and his work on Frege has revolutionized the subject. In *Principles of Electoral Reform* he seeks to apply the

tools of his trade to the theory of voting. He reiterates some of the arguments of his previous book, *Voting Procedures* (1984) but in rather less technical language. In the earlier book, Dummett had sought to construct a bridge between mathematical theorists of voting and political scientists, deploring the fact that so much of the modern theory of voting seemed unknown to political scientists. That criticism is perhaps less applicable now than it was in 1984. *Principles of Electoral Reform* presents some of the main arguments of voting theorists in a form easily accessible to nonmathematicians and to those untrained in formal logic. There is thus even less excuse than before for political scientists to remain in ignorance of this important body of work.

Principles of Electoral Reform is a work of rigor and profundity that needs to be read by any political scientist with an interest in electoral systems. Yet, its central arguments seem to be misconceived. Dummett is concerned less with recommending a particular electoral system than with formulating principles and clarifying issues. His central contention, however, is that the single transferable vote (STV) is inferior to a system of voting in multimember constituencies based on the Borda criterion, which he calls the Quota/Borda system. Dummett shows that, contrary to the arguments of many of its advocates, STV does not eliminate tactical voting and also that it is nonmonotonic, that is, in some cases, one can harm a candidate's chances of election by ranking her highest. This is because the order in which candidates are eliminated can make a crucial difference to the result, since it is the preferences only for eliminated candidates that contribute to the final outcome. STV, for Dummett, has the weakness that, at later stages of the counting process, it gives the same weight to some voters' later preferences as it does to other voters' first preferences, while never giving any weight at all to some voters' later preferences, depending solely on the accidents of which candidates are eliminated and in which order. In particular, STV "gives no weight to the second or later choices of the supporters of a candidate who survives until the final stage, only then to be defeated" (p. 105). Thus, "the sequential redistribution of votes under STV can magnify the effect of a slight change in the initial allocation of the votes" (p. 145). Hence, supporters of a candidate may not always be doing their best for her by ranking her first.

The question, however, is how often nonmonotonicity is likely to occur. Dummett criticizes one claim, that it will occur only in .028% of cases, as a "ludicrous underestimate," arguing on the basis of "a rough calculation," which he does not supply, that "with three candidates under AV [the alternative vote] 2% would be a conservative estimate" (p. 105, n). Yet, Patrick Bradley, Chief Electoral Officer for Northern Ireland, where STV has been used since 1973 for all elections except those for Westminster, claims that "the experience of the use of STV in Northern Ireland over the past 22 years, involving a range of election types and sizes, reveals no evidence to support in practice the lack of monotonicity" (*Representation* 33[Summer/Autumn 1995]:47; italics in original). Even if this were not the case, it would be difficult to see how the voter can *manipulate* STV to take advantage of this property of nonmonotonicity. Indeed, the Borda system Dummett recommends is, as will be shown below, far more susceptible to manipulation than STV.

Dummett argues that the concept of the wasted vote, which plays a prominent part in arguments for STV, "is thoroughly confused and unhelpful in thinking about electoral systems" (p. 118). Yet, his understanding of this concept is different from that of the advocates of STV whom he criticizes. For Dummett, a vote is wasted under any electoral

system if, "by voting differently, one could, *under that same system*, have obtained an outcome one preferred" (pp. 110–1). Advocates of STV, by contrast, regard a wasted vote as one that is not used to elect a candidate. Under STV, the only such votes are those cast for the runner-up, and it is usually the case that supporters of all the major candidates in a multimember constituency have a candidate of their favored party elected. The concept of the wasted vote, employed in this way, may be as incoherent as that criticized by Dummett, but Dummett does not prove it so.

An electoral system, in Dummett's view, has to answer two questions. First, how is the legislature to be composed? Second, who is to represent each constituency? Dummett argues that Borda's criterion or, alternatively, Condorcet's criterion, with the Copeland extension, is most likely to choose the most representative candidate in a single-member constituency. Dummett admits that "there can be no actual proof of this contention" (p. 66). This is because, to have a proof, we would require a criterion for the most representative candidate and show that it tallied with the Borda or Condorcet criterion. But it is just such a criterion that we are seeking. Therefore, the only test can be one of intuition. Dummett further admits that the Borda criterion may result in the defeat of a candidate who has an overall majority of first preferences.

Dummett claims in addition that, although no electoral system can avoid tactical voting, the Borda system is the only one which cannot be manipulated by a majority. That is an odd contention. Under the Borda scheme, as under any points system of voting, later preferences count against and may defeat a candidate who is the first preference of an absolute majority of the voters. Therefore, a sensible tactical strategy would be to use one's earlier preferences on those candidates least likely to be elected, giving the last preference to the most dangerous rival of one's favored candidate. It seems much easier for a voter to manipulate the Borda system in this way than it is to manipulate STV.

There are further incoherences in a points system of the Borda type. If the system yields 1 to the first choice, 2 to the second, 3 to the third, and so on, then the larger the number of candidates, the higher is the proportion of points allocated to the second and to later preferences as compared to the first. With three candidates, three points are allocated to later preferences, one in two votes counting against the first preference; with eight candidates, twenty-eight points are allocated to later preferences, so that seven-ninths of the votes cast count against the first preference. Thus, the number of points allocated to successive preferences is determined not by the voter but by the number of candidates. It would, of course, be possible to adopt a different weighting, for example, geometric rather than arithmetic. But the weighting one adopts, reflecting as it does assumptions about the relative strengths of voter preferences, is essentially arbitrary. The voter's ranking, after all, may be either 1, 2, 3, 4 or 1, 2, 4, 9. We have no means of knowing which of these is the correct one, no means of knowing how the voter perceives the relative strengths of the various candidates.

Electoral Change since 1945 is a very different sort of book from *Principles of Electoral Reform*. It does not pretend to be a work of original research but instead offers a synthesis of theories of electoral change in Britain since the end of World War II. It analyzes the development of the party system, from two-party dominance until 1970 to what the author calls a declining two-party system since that date, a characterization Norris prefers to such competing descriptions as multiparty system or predominant party system. The analysis is conducted in terms of theories of voting behavior and theories of

party competition, but the author is in general cautious about drawing conclusions, being concerned more to expound than to evaluate.

Electoral Change since 1945 summarizes an astonishing amount of material. It will be of enormous use both to students seeking an overview of the subject and to established political scientists unfamiliar with the field. It is undoubtedly the best survey book of its type dealing with British electoral behavior that is currently available.

French Presidentialism and the Election of 1995. Edited by John Gaffney and Lorna Milne. Brookfield, VT: Ashgate, 1997. 305p. \$76.95.

Roy Pierce, *University of Michigan*

This collective work on the French presidential election of 1995 is in the vein of the earlier volume edited by John Gaffney on the 1988 election. There is, however, a considerable turnover among contributors. Of the earlier team, in addition to Gaffney (who contributes a chapter on the mainstream Right, as well as coauthors the Introduction and provides the Conclusion), only Alistair Cole (on Mitterrand), David Bell (who provides a chapter, with Byron Criddle, on the leftist candidates), and Susan Milner (on the unions) appear in the more recent work.

The newcomers, some of whom are veterans, are the late Peter Morris, who provides an historical background; Lorna Milne, who writes on the myth of the president; David Goldey, who contributes an acute and well-informed analysis of the results; Irene Hill, whose chapter on political finance would be even more useful if less legalistic; Catherine Fieschi, who examines the "other" candidates, including Le Pen; Mairi Maclean, on the role of business; Pamela Moores and Christophe Texier, on the media; Jean and Monica Charlot, who provide expert commentary on the polls; Douglas Johnson, on foreign policy issues; and Catherine Pradeilles, who contributes a striking criticism of the media, politicians, and political experts as interpreters of French public opinion.

A book with sixteen chapters and seventeen authors can be expected to have certain strengths and weaknesses. Among the former are the range of information and variety in interpretation that can be provided by various specialists. There also is no shortage of interesting vignettes and insightful comments. Gaffney, discussing the mainstream Right, tells us that "in French politics, a heavy premium is placed upon friendship and loyalty; treachery, therefore, is everywhere" (p. 99). Goldey's analysis is particularly interesting on the semantics of the Communist Party at the second ballot, when it chose to defeat the Right but not to support Jospin! Bell and Criddle remind us that the presidential system, "supposedly inimical to the left, had given the Socialists their longest ever tenure of power" (p. 132). Fieschi tells us how the unknown Jacques Cheminade managed to get the 500 supporting signatures required to stand as a presidential candidate. The Charlot team points out how long it took for the various polling firms to ascertain the actual line-ups of candidates for the two ballots for purposes of measuring preelectoral voting intentions (whose limitations the Charlots also clearly describe), and they point out that none of them got the results of the first round of voting in the right order. Much of the chapter by Pradeilles is devoted to demonstrating how the media, politicians, and experts got it all wrong: Nothing that was expected actually happened, and they all

"exalted the presidential function," while the reality was a "weakened, impotent, almost absent President" (p. 233).

There are some lacunae. Discussing the 1962 establishment by referendum of direct popular election of the president, Morris reports only de Gaulle's version of the reason for doing so: that it would be necessary for his successors to be legitimized by popular vote. But by 1962, it was not certain that de Gaulle could be reelected under the same electoral college system that had elected him in 1958. It might have seemed to him that he was more popular with the public at large than with the political class from which an electoral college would be drawn. It is possible, therefore, that the popular vote was designed to ensure de Gaulle's reelection.

The book contains more discussion of why Chirac won than it does of why Jospin, who entered the race only three months before the election, did as well as he did. How much of Jospin's good showing was due to his leftist affiliation, how much to his personal probity, and how much to disaffection with veteran insiders parading as harbingers of change?

Finally, I would have appreciated more than the very few comparative references that appear throughout the book, usually to good effect. Only by comparison with the United States, or Russia, or even parliamentary Britain can one gain confidence that some phenomenon is characteristic of a given national system rather than of some more general behavioral imperative. While reading Gaffney's question about whether Chirac had really changed (p. 281), I found myself thinking of "the new Nixon" and "the real Bob Dole."

The potential weakness of a collective work is the lack of a common inspiration. Gaffney tries to give unity to the book, mainly in the final chapter. I think he is on the right track when he emphasizes both that French parties "are in a state of perpetual organizational activity, constant change, and near-permanent campaigning for the presidency" (p. 277) and that "individual decisions, tactics, and timing" (p. 278) have inordinate significance in that context. But Gaffney does not have the opportunity in this volume to develop, qualify, nuance, and document such a broad interpretation. I hope he pursues the issue elsewhere.

The Crisis in Kashmir: Portents of War, Hopes of Peace. By Sumit Ganguly. New York and Washington, DC: Cambridge University Press, co-published with the Woodrow Wilson Center Press, 1997. 182p. \$49.95.

Robert G. Wirsing, *University of South Carolina*

Heightened tension between India and Pakistan in recent years has rekindled scholarly interest in the now more than fifty-year-old territorial dispute over the Himalayan state of Jammu and Kashmir. This book focuses on the roots of the insurgency that has embroiled the Indian-administered portion of the state since 1989. Its author, an established and prolific writer on subcontinental political and security affairs, provides a detailed narration of the insurgency's evolution. He considers both its shorter- and longer-term causes. The discussion includes examination of what might be done to resolve the insurgency. Relatively detached in comparison with much that has been written on the subject, the book manages nevertheless to run aground here and there on the shoals of controversy.

In his examination of the sources of the insurgency in Kashmir, Ganguly begins with a discussion of four existing categories of argument—(1) that the insurgency is little more than state-sponsored (Pakistani) terrorism; (2) that the insurgency arises from India's brutal denial of the Kashmiris' right of self-determination; (3) that the insurgency bears

witness to the rise in Kashmir of ethnic subnationalism, which destroyed the syncretistic Kashmiri cultural identity (called *kashmiriyat*) that had bound Hindus and Muslims together peacefully for many centuries; and (4) what Ganguly labels circumstantial and atheoretical accounts, that the insurgency arises from a mix of historical variables. Dismissing all of them as more or less inadequate, Ganguly proposes an alternative explanation, one that relates the insurgency in Kashmir to the theoretical literature on ethnonationalism, and, in particular, to the pioneering work of Samuel P. Huntington on political mobilization and institutional decay. Ganguly argues that rapidly paced modernization, in the form of more education, literacy, exposure to mass media, and social and physical mobility, exponentially enlarged consciousness among Kashmiris of political rights and privileges. As their awareness grew of the possibility of an alternative future, so did their disaffection from the increasingly ill-functioning and repressive political apparatus—the "institutional decay," in other words—that increasingly characterized political life in the state of Jammu and Kashmir. Ganguly points to a curious paradox here, namely, that it was India's considerable success in introducing the benefits of modernization to Kashmir that eventually produced a radicalized younger generation for whom violent and separatist sentiments had a natural appeal. Most of Ganguly's book is an effort to chronicle the gradual widening of the gap between the enlarged expectations of Kashmiris and the Indian government's declining ability and/or willingness to alter the political circumstances that frustrated their realization.

The Kashmir dispute's genesis in 1947, which has filled countless pages in numerous other works on Kashmir, gets very short shrift in this one. Ganguly, conceding that the present situation cannot be grasped sufficiently without some understanding of regional history, devotes exactly eight pages to it. Treading on ground that had already been raked over by others often and with meticulous care, Ganguly might have been better advised to skip it entirely. Quick to dismiss the "highly prejudicial inferences and little or no evidence" (p. 11) of a hugely controversial British historian (Alastair Lamb, *Kashmir: A Disputed Legacy, 1846–1990*, 1991), Ganguly himself furnishes an amazingly truncated and haphazard version of the Kashmir dispute's earliest phases. Particularly puzzling is his rendering of the weeks immediately preceding the princely ruler of Kashmir's request for Indian troops in late October 1947. He states, for instance, that "under the terms of the Indian Independence Act, none of the princely states would be allowed to declare independence." (p. 8). In fact, the act did no such thing, the departing British having deliberately decided not to mandate the automatic legal transfer of paramount power over the princely states to the new governments of India and Pakistan at independence. That British reticence in this regard resulted in an immediate political tussle between India and Pakistan, the latter committing itself at that stage wholeheartedly to the legal right of the princes to decide the matter, is dealt with at considerable length by an Indian historian whom Ganguly cites frequently throughout his book (Jyoti Bhusan Das Gupta, *Jammu and Kashmir*, 1968).

Equally puzzling is the distortion of events found in Ganguly's narrative of the invasion of Kashmir by Pashtun tribals—an invasion that lent moral legitimacy to India's airlifting of troops to the beleaguered ruler of the state. In Ganguly's rendering, the "invading column" (p. 9) of tribesmen, augmented by disguised Pakistani troops, appears to have materialized at the Kashmir State border on October 22 following its participation in a successful rebellion earlier in

the month slightly to the south in the Poonch subdivision of Jammu and Kashmir State. Indian and Pakistani accounts of the facts of this invasion disagree violently; but there is widespread agreement that a significant portion of the tribesmen were recruited for the invasion in Pakistan's Northwest Frontier Province, that they were transported to the Kashmir State border in trucks and busses through Pakistan's Hazara district, and that at the border they were joined by rebellious Muslims from Poonch and from the Jammu and Kashmir State forces. Also objectionable is Ganguly's suggestion that the ruler of Kashmir, "caught in a panic" by the tribal invasion of October 22, appealed at that time for military assistance to the princely ruler of Patiala State. In this claim, Ganguly is given no support either by Lamb, whose version he dismisses, or by Jha (Prem Shankar Jha, *Kashmir 1947: Rival Versions of History*, 1996), whom he cites approvingly. Jha, anxious to free the Indian government of responsibility for military assistance to the princely ruler of Kashmir prior to the tribal invasion, goes to great lengths, in fact, to demonstrate that the Patiala men were dispatched to Kashmir possibly even before India gained its independence on August 15 but in no case later than the early days of October.

Once Ganguly gets beyond the contentious matters pertaining to the year 1947, his discussion grows more solid, both factually and analytically. His treatment of India's post-independence political history is methodical and builds a convincing case for his mobilization cum deinstitutionalization thesis. Other recent works (e.g., see Sumantra Bose, *The Challenge in Kashmir*, 1997) lend at least parts of his thesis strong support. Some of his substantive assertions, however, deserve careful scrutiny. His fixing, for example, of "the beginnings of the wearing away of the special status of Jammu and Kashmir as a state within the Indian Union" (pp. 56–7) to the years between 1962 and 1965 does not square with most of what has been written by either Indian or foreign writers. The Kashmiri Muslim leader Sheikh Abdullah's arrest and incarceration in 1953; promulgation in 1954 by the president of India of the Constitutional (Application to Jammu and Kashmir) Order, which vastly extended the Indian government's legislative powers in Jammu and Kashmir; or the extension to Kashmir in 1960 of the Indian Supreme Court's jurisdiction would all seem to be better markers for the wearing away of Kashmiri autonomy.

Also to be questioned is Ganguly's argument that Kashmiri Muslim disaffection from India is of very recent origin—hardly antedating the 1980s. As evidence, he points to the fact that neither in the 1965 nor 1971 wars between India and Pakistan did the Kashmiris seize the opportunity to rise against their Indian masters. It is true, of course, that they did not rise up then. But Ganguly runs well beyond available empirical evidence with his claim that "the vast majority of Kashmir's Muslims had [thus] amply demonstrated their loyalty to India during both the 1965 and the 1971 wars" (p. 64).

For this reviewer, the most compelling part of the book is its final chapter, in which Ganguly provides an astute and balanced critical assessment of the various strategies and options that have been proposed in recent years for resolving the crisis. His own proposal retains Kashmir solidly within India and, since it recommends only token concessions to Pakistan and rules out independence for Kashmir, is unlikely to meet with favor, at least initially, either in Pakistan or among vast segments of the Kashmiri Muslim population. But especially welcome is its broad affirmation of the need to restore Kashmir's autonomy, including the suggestions that Kashmir be returned to its pre-1952 status (with New Delhi left in control solely of defense, foreign affairs, and commu-

nications) and that the Kashmiris be invited to write their own constitution.

In sum, while Ganguly's book makes a substantial contribution to the burgeoning literature on Kashmir, it falls well short of being either a definitive study of the insurgency or a major theoretical breakthrough. It is, moreover, seriously marred at a number of points by an all-too-casual approach to facts as well as by its author's apparent wish to score points over his scholarly opponents.

The Disenchantment of the World: A Political History of Religion. By Mark Gauchet. Princeton, NJ: Princeton University Press, 1997. 272p. \$24.95.

Adam B. Seligman, *Boston University*

The subtitle of Peter Gay's seminal book on the Enlightenment was, for those who do not recall, "the rise of modern paganism." The full meaning of this, however, was brought home to me only a few years ago when, upon giving birth to our second child, my wife was given the option of taking her placenta home in a plastic bag along with a recipe for soup.

Marcel Gauchet's overriding concern is in describing and explaining the long parabolic movement from the binding of Isaac to such forms of modern if not postmodern paganism. His concern is with that process inherent to religion per se which, in explicating transcendence, sets up its very demise and with it a plethora of subjectivist responses to the overriding questions of meaning, ethics, and normative order.

The different forms of "the religious after religion" are, however, only of passing concern at the end of this intricately argued, dense, difficult yet thoroughly absorbing work. The truly radical thesis presented by the author pertains not to the variety of "postreligion" phenomena but to the origins and dynamics of what have been termed the great world historical religions, or what Karl Jaspers called the Axial Age. His thesis is one of Hesoidian decline. Rather than the apogee of religious instauration, Gauchet sees that Axial Age, that period when the consciousness of transcendence registered across the myriad religious traditions of Ancient Israel, Ancient Greece, Early Christianity, Zoroastrian Islam, early Imperial China as well as in the Hindu and Buddhist civilizations (and much later in Islam), as marking the first yet critical stage in religion's decline.

For Gauchet, the primordial essence of religion is in its permanence and what he terms "sacral dependence" on and indebtedness to an inviolable and external foundation. What takes an effort to assimilate is his claim that the radical heteronomy of Axial religions actually reduced this otherness in the very act of proclaiming a transcendent sphere vis-à-vis which the world was ordered. His claim is that the very act of establishing a hierarchy, of bringing the world into relation with the transcendent, even as that act relativizes the world, its meanings, statuses, and orders, it does the same to transcendent otherness as well; relativizing it vis-à-vis the world. Rather than a breakthrough to transcendence he therefore sees the Axial revolutions as the first stage in the decline of an otherness that, existing prior to *nomos*, was hence all the more absolute.

Needless to say this is both original and controversial. Not that the Axial moment does not do what Gauchet claims. Indeed, the idea that by bringing the world into relation with the transcendent other more is relativized than just the world is striking and brilliant. Rather, it is in what existed on the other side of the Axial revolution, the ontological structures of pre-Axial being, that must be questioned. What is lacking or obscure is precisely a phenomenology of that imminence, that sense of

being which for Gauchet presupposes the absolute distancing of the world from its foundations. Hence, for example, Gauchet speaks of Axial religion as reorienting the temporal dimension from past to present. Is not the real revolution, however, in temporality as such, in the very idea of time, of temporal change, of becoming, of a present, but through the idea of a created past and final future? Without a clear hold on matters such as these (and here I believe Gauchet is at his weakest) it is hard to grasp what preceded the Axial Age. Here, by the way, the thought of Eric Voeglin is most helpful and surprisingly absent from Gauchet's writing.

In the reflective stance that accompanies Axial religion the distance of the world from its other begins to shrink. Yet, here too, the foreshortening is not of a set. A created world and, for that matter, a Creator God, enter into a very different dynamic than what we find in, say, the Hindu tradition. Consequently, the world relativizes in very different ways as does transcendence leading to very different modes of disenchantment. Now the lack of a comparative perspective would not of itself be a legitimate critique of a work such as Gauchet's except that he repeats an oft-encountered *deformation professionnelle* in religious studies; that of writing, however unknowingly, from a Christian perspective, even a secular and disenchanted one. All too often the general characteristics of Axial religion are conflated with the particular solutions posited by Christianity to the soteriological drama that the Axial Age opened up. Again and again the analytic boundaries between what is unique to Christianity and what was expressed in all Axial religions is blurred.

This is especially so in Gauchet's central point—that of the emergence and eventual triumph of the individual and subjective inwardness as the key variable in the decline of otherness. Here, however, a much more precise delineation of what is uniquely Christian and what was an aspect of all Axial religion is needed. In a sense the Pauline (and later Augustinian) revolutions are almost marginalized in importance as the category of the individual is made an attribute of Axial religion as a whole. This I believe is mistaken. Just as there was no "sudden appearance of the personal god" (p. 64) but only the long tortuous development of such an idea which involved an internal revolution in one particular Axial religion (Judaism), so there is no constitutive term of inwardness in all Axial religion. Or at very least, that sense of inwardness that emerges with transcendence must be analytically distinguished from that inward revolution in Jewish law that Paul introduced to make of Judaism a universal religion.

Concentrating more on the terms in which the Deity is posited and less in the modes of overcoming or bridging the Axial chasm, Gauchet tends to incorporate too much into the specificity of Christian soteriology. General components of the Axial revolution are presented as specifically Christian (p. 143) while specifically Christian innovations are presented as concomitant with the very idea of transcendence. This then becomes a problem in properly grasping the dynamics of secularization, the progress of reason, and the logic of political representation.

Having said this, we must stress the originality and cogency of Gauchet's analysis as well as its convincing questioning of received categories. It is a book to be read and studied more than once, not only for its general thesis, but for its many insights, not least his insight into the progress of modernity from the internal transformations of institutionalized Christian belief.

The Kurdish Question and Turkey: An Example of a Trans-State Ethnic Conflict. By Kemal Kirisci and Gareth M. Winrow. London and Portland, OR: Frank Cass, 1997. 216p. \$45.00 cloth, \$25.00 paper.

The Kurds and the Future of Turkey. By Michael M. Gunter. New York: St. Martin's, 1997. 184p. \$45.00.

Frank Tachau, *University of Illinois at Chicago*

The Kurds present an intriguing case study of frustrated nationalism. They are often cited as the largest ethnic group, at least in the Middle East, that has failed to gain statehood in the late twentieth century. Numbering 20 million or more, Kurds occupy an area that straddles the borders of Turkey, Iran, Iraq, Syria, Armenia, and Azerbaijan. They are thus an outstanding example of transstate ethnicity. Yet, this nation in formation, and especially its Turkish segment, which apparently accounts for the largest numbers, has not received much scholarly attention until quite recently. (The most frequently cited study is Martin van Bruinessen, *Aga, Shaikh, and State: The Social and Political Structures of Kurdistan*, 1992, 1st ed. 1978). Many books dealing with the Kurds take the form of advocacy, sometimes in impassioned terms. In part this reflects the effect of the Kurds on Western publics, especially since the Gulf War, in the aftermath of which hundreds of thousands of them fled from Iraq into Iran and Turkey. Their plight was vividly recorded by the news media and triggered a hasty visit by U.S. Secretary of State James Baker. (Thanks to the marvels of modern technology, the visit lasted only seven minutes [*The Kurds*, p. 160] but was long enough for a TV interview and graphically symbolized American concern.)

Dispassionate scholars familiar with the Kurds are hard to find. As an organized Kurdish insurrection within Turkey drags on into its fifteenth year, however, this is beginning to change. A refreshing example is the first of the works under review.

Kemal Kirisci and Gareth Winrow, both of Bosphorus University in Istanbul, have produced a detailed analysis of the Kurdish conflict in Turkey. They begin by setting this case in the context of the general scholarly literature on nationalism and ethnicity, as well as against the historical background of the multiethnic Ottoman Empire. They compare the Kurds in Turkey with the Basques in Spain, noting that the comparison is weakened by the fact that the Basques occupy a highly industrialized and prosperous region, while the Kurds have historically lived in a remote, backward, and poverty-stricken area. The authors are also discomfited by the fact that, despite the apparent lack of material deprivation among the Basques, violence continues to characterize the most radical militants among them; this obviously does not provide a reassuring model for the Kurds, at least from the Turkish point of view.

Kirisci and Winrow devote an entire chapter to the concepts of minority rights and self-determination. Following a general discussion, they apply these concepts to the Kurds in Turkey, indicating the political changes that would be necessary within the Turkish political system, as well as obstacles that mitigate against this option.

The bulk of the book (five of eight chapters) is devoted to a critical appraisal of the Kurdish question in Turkey as it has evolved during the twentieth century, beginning with the post-World War I negotiations that determined the disposition of the territories remaining under the control of the Ottoman Empire. They describe the shifting and conflicting interests of Britain and France, the prostrate Ottoman government in Istanbul, and the newly rising national resistance movement led by Mustafa Kemal Pasha based in Anatolia.

Their depiction of the latter emphasizes its multiethnic character, principally comprising Turks and Kurds. The movement initially claimed to speak for the Muslim subjects of the virtually defunct Ottoman Empire; only gradually did its terminology shift toward a specifically Turkish ethnic mode. This much has been commonly acknowledged by scholars for decades. The precise role of the Kurds, the degree of their participation in the national resistance, and their attitudes have been less clear. Kirisci and Winrow suggest that a number of factors divided the Kurds, among them the survival of traditional tribal structures, continued adherence to religious tradition, and, consequently, opposition to the modernizing, centralizing, and secularizing policies of the Kemalist regime. As has been argued by other scholars, the various Kurdish uprisings against the Turkish Republic in the 1920s and 1930s are accordingly depicted as arising from mixed motives, ethnic consciousness being only one component among several and not necessarily always the strongest one.

Over time, Kirisci and Winrow argue, the Republican regime succeeded in establishing a politically stable secular, centralized, and modernizing regime. At the same time, in the 1930s, the regime increasingly emphasized an ethnic variant of nationalism rather than a more moderate form of "civic integration." This tendency, they propose, quoting a recent study by a Turkish colleague, heightened awareness of a distinct ethnic identity among the Kurdish masses. In other words, Kurdish nationalism arose as a reaction against Turkish nationalism. The Turkish government continued to accept "individuals with a good command of the Turkish language as 'Turks.' Their ethnic background was not important. The system had aimed to integrate many of these 'Turks' into the ruling elite. However, any expression of ethnicity—other than Turkish ethnicity—was perceived by officials in Ankara as a threat to the existence of the state itself" (*Kurdish Question* p. 113). This sensitivity toward any suggestion of even minimal recognition of Kurdish ethnicity or identity has remained the hallmark of Turkish government policy to this day.

Kurds form 10–15% of the population of Turkey. The exact number is difficult to pin down; Kirisci and Winrow suggest an estimate of approximately 6 million in 1992, or 10.7% of the total population of Turkey (Gunter, p. 2, estimates 20–25%). Apart from language, Kurds and Turks have been difficult to distinguish from one another. Traditionally, intermarriage has been widespread. Unlike the Arabs, who are also predominantly Muslim, the Kurds were slow to develop separatist nationalism.

Kurds are the largest ethnic minority in Turkey. They have historically been concentrated in the eastern and southeastern provinces (although extensive out-migration has significantly modified that pattern in recent years). Inhabiting the poorest parts of the country, adjacent to the Iraqi and Iranian borders, they have been close to ethnic brothers across those borders, with whom many of them have kinship ties. These kinsmen are caught up in struggles to attain or maintain a tenuous autonomy of their own, especially in northern Iraq.

The current conflict between the Kurds and the Turkish government is dominated by the ultraleftist Workers' Party of Kurdistan, or PKK. Well over 20,000 lives have been lost since the inception of an open insurrection led by the PKK, several thousand Kurdish villages have been evacuated and

destroyed, and thousands if not millions of Kurds have migrated to Turkish cities in the western part of the country or abroad to Europe. A special legal regime comparable to martial law has been imposed on Turkey's southeastern region, under which normal civil rights are suspended, and freedom of information and communication is virtually nonexistent. The Turkish army has on several occasions crossed the Iraqi border to destroy PKK bases. Kurds elected to the Turkish parliament have been deprived of parliamentary immunity and have been tried, convicted, and imprisoned on charges of advocating and abetting "separatism," a charge akin to treason in the Turkish legal and political lexicon. Tentative conciliatory suggestions by leading politicians have failed to restrain the use of sharply repressive measures by the military. The conflict has imposed itself on Turkish foreign relations as well, providing justification for keeping Turkey out of the European Union and triggering congressional barriers to the acquisition of military hardware in the United States by the Turkish government, including items bought and paid for.

Kirisci and Winrow review these developments with remarkable candor and even courage, considering the political sensitivity of this issue in contemporary Turkish politics. Their conclusion is straightforward: The most effective way to end the conflict is to seek a politically negotiated settlement, specifically providing for rights of cultural autonomy, including the right to use the Kurdish language in the media and education. The fear that such concessions will inexorably lead to the collapse of the Turkish state, they argue, is grossly exaggerated. They are not optimistic, however, that the Turkish political elite will soon prove willing to agree to such a solution, given the weakness of contemporary parties and their leaders and the belligerent attitude of the powerful military hierarchy. They bluntly assert that reliance on military measures "is unlikely to reap benefits in the longer term," since "PKK units will always be able to evade the Turkish armed forces by finding sanctuary in the remote mountains of the east or in the territory of neighbouring states" (*Kurdish Question* p. 183).

Michael Gunter's account consists of a compendium of facts on the Kurdish uprising in Turkey and its effect on Turkish politics, particularly in the realm of foreign policy. It is largely based on sources drawn from the Foreign Broadcast Information Service of the U.S. government. Gunter considers himself an "objective" scholar, but unlike Kirisci and Winrow, he does not hide his sympathy for the Kurds. There are a few stabs at comparative analysis, but, again unlike Kirisci and Winrow, these are not well integrated into the analytical framework. Suggestions for alternative policies designed to bring a peaceful end to this largely invisible war focus on greater democratization of Turkey and recognition of Kurdish cultural rights, paralleling Kirisci and Winrow. Gunter goes one step farther, however, suggesting that general local autonomy—indeed, federation—is the only feasible solution. Yet, he acknowledges that only a charismatic military leader like Atatürk, de Gaulle, Rabin, or George Marshall (p. 135) would be able to overcome the military's insistence on the use of force.

In elaborating and analyzing the case of the Kurds in Turkey, these two books, each in its own way, provide potentially useful comparative data for the further study of ethnicity and nationalism in the contemporary world.

Australia was a pioneer in the development of mass democracy, with manhood suffrage from the late 1850s, votes for women instituted second only to New Zealand, and a variety of electoral systems designed to represent public opinion as effectively as possible. Yet, it maintains the anomalous and puzzling headship of state by a monarch who lives 12,000 miles away and, for most of whose time, is the head of state of the United Kingdom. As with Canada and New Zealand, this strange arrangement stems from the historical connection with the original homeland of the majority of earlier immigrants. But the economic links between Britain and Australia have become increasingly tenuous, the great majority of current immigrants do not come from Britain, and governments over the past two decades have been urging with various degrees of enthusiasm that Australia is part of Asia. The impending centenary of Australian federation is concentrating political minds on the anomalous monarchy. For the first time in two centuries, a clear majority of Australians now favors a republic. Even the present conservative government seems ready to end the historical link in conformity with the decisions of a partly elected constitutional convention held in Canberra in 1998.

These developments have spawned an increasing number of books on the republic, citizenship, federalism, and the constitution in general. The idea that these concerns were confined to a few academics and lawyers was dispelled by the wide popular interest in the convention. Apart from the issue of the monarchy, the Australian constitution has none of the rhetoric and inspiration of the American. It was primarily the result of negotiations by British colonies, which accepted without much questioning the British system of government, although with a more populist tinge than was true for Britain. The constitution has proved very difficult to amend through the required referendum procedure, and most Australians do not have a clear idea of its relatively mundane contents. Some scholars, such as Alastair Davidson, would clearly prefer to start all over again on the basis of modern ideas of citizenship rather than somewhat archaic concepts of the relative powers of units within a federal system. Many would favor the inclusion of a bill of rights or a preamble stating the nature of the society and the rights and obligations of citizens. A clear majority of public opinion wants an elected head of state, which could produce a massive lurch away from the British and toward the American model.

Until recently the very idea of becoming a republic was usually outside the bounds of political debate. That was not always so, however, as Mark McKenna skillfully outlines in his history of Australian republicanism. Radicals who wanted to assert local autonomy within the British Empire frequently expressed their hostility to the British connection. When Queen Victoria was unpopular in England, as in the 1860s and 1870s, many Australians were willing to argue that she should cease to be the focus for loyalty and patriotism. But this was all swept away by the enthusiasm for the empire, which reached its height in the Boer War and was sustained by World War I, when Australian loss of life was proportion-

ately very high, though suffered on far distant battlefields. From 1918 until the 1960s it was political death to advocate a republic, and few did so.

McKenna is clearly a republican, but his basic argument is that Australians have been very ambivalent and sometimes indifferent to constitutional issues. Other matters were more important, especially the relations between labor and capital and the desire to exclude non-European immigrants. Now that half the immigrants are non-European and trade union membership has declined, other issues have become more important, including the nature of the political system. The obsequious monarchism of the postwar Menzies government has for long been a subject of ridicule. McKenna provides some amusing illustrations from official briefings on how to behave during the royal visit of 1954. But he rejects the idea that republicanism was mainly of Irish-Australian inspiration: "In an Australian context the Irish have supported the maintenance of the connection with Britain" (p. 211). As he details, most earlier republicans were born either in England or Scotland.

The most important turning point was the dismissal of the Whitlam Labor government by the governor-general in 1975. Queen Elizabeth remained firmly in her London bed at the height of the crisis. That an elected government could be overthrown by her representative certainly sharpened debate, even though the governor-general was Australian-born and had been appointed by the very prime minister he dismissed. McKenna places the end of the "colonial" relationship as early as 1963, but many others would prefer 1975. Either way, it has been all downhill for the past twenty years, despite residual monarchism among the Liberal and National parties currently ruling Australia and five of its six states. McKenna concludes that "the more substantial and potentially invigorating republicanism is that which seeks to move the republican debate beyond the familiar framework of monarch or president to encompass the essence of 'respublica' and the commonwealth—government for the common good" (p. 267). Similar themes are taken up by Davidson and Marginson.

McKenna's study is excellent political and ideological history. It shows that some arguments have been in use for 150 years, a remarkable continuity in a system little more than two centuries old. Perhaps he underestimates lingering nostalgia for British traditions in a country with more than one million British-born immigrants. Perhaps he plays down the Irish contribution to Australian radicalism, although he is quite right in seeing most Irish Catholics as basically conservative. The real test of republicanism will come when constitutional change is put to a referendum, as it must be. Australians have a remarkable history of voting against such changes. The current prime minister probably hopes that they will do so again. McKenna shows that republicanism was rarely a mass popular sentiment. It may yet be defeated by popular apathy or suspicion. Unless the political parties can agree on details, which is currently unlikely, Australia may still be a "monarchy" into the next millenium. This will not prevent the broader debates on national identity and active citizenship that McKenna, Davidson, and Marginson want, any more than it does in Britain, Canada, or Sweden. But it will be an odd, and to many a disappointing, outcome.

McKenna writes clear, chronological, and polemical history, and his arguments are certainly easier to follow than those of Davidson. This is partly because Davidson is trying to do something more difficult, partly because Davidson uses a less rigorous framework, and partly because he is strongly influenced by European models, which have historically had little influence on Australia compared with those derived

from Britain or the United States. The intellectual context within which Davidson writes is thus less familiar and would certainly prove to be so to most people active in Australian public life over the past century. Unlike McKenna, he comes out of a Marxist tradition, which still colors his arguments, despite the peripheral influence of Australian Marxism throughout this century. Thus, he stresses the dilemma of those excluded from the political system for various reasons, particularly aborigines and immigrants. As the organized working class has taken a major role in Australian politics, he is less concerned about them. But an "excluded" element to which much attention was paid in the 1996 election—uneducated blue-collar workers—gets less attention than it deserves. Australian political leadership now rests to a greater extent than ever before in the hands of university-educated professionals. If Australia was ever a workingman's paradise, as many believed at the turn of the century, then it no longer is, at least in terms of political power.

Apart from being a monarchy, another historical anomaly is that Australia did not have legal citizenship distinct from the British until 1949. Davidson traces the development of a distinct citizenship based on an agreed national identity and then argues that much remains to be done. Formal citizenship is not the same as an active democratic citizenship. Public apathy is masked by compulsory voting in Australia, so it is often hard to know how interested or informed the voters are about political affairs. Davidson suggests that many of the excluded have been consciously repressed by the holders of power and that the task is to rearrange that power through a bill of rights and by an actively engaged citizenry. He draws extensively on debates in France and Italy and on the formulations of the European Union, none of which have had much effect on Australia. He also believes that there is a largely frustrated urge for greater participation in government, a view institutionalized in the recent past by public consultation and the creation of a multitude of advisory councils. Yet, the public sense of alienation remained, and revenge was taken in 1996 on the very government which had so greatly extended participation, however artificially.

Marginson's study is ostensibly narrower in focus: developments in Australian education over the past 35 years. He is scathing (as are most professional educators) about the victory of so-called economic rationalism in public policy. By this is meant the primacy of free-market ideology and the consequent emphasis on education as vocational and market driven. He responds more directly to the 1996 election reversal than do McKenna and Davidson, but he wants the same active, educated citizenry. He traces the rise of the New Right, with its influences from Thatcher's Britain and Reagan's America running counter to the previous Keynesian consensus, which had dominated governments for the previous thirty years. In his view, "education's role in producing and reproducing social hierarchy would increasingly overshadow its role in the constitution of universal citizenship" (p. 144). Marginson knows what he is talking about when it comes to education policy. But one might ask whether the traditions of public education in the past were not even more hierarchical and vocational than they are today. From this perspective, the rapid expansion and liberalization of education in the 1960s and 1970s seems like not only a lost golden age but also a transient phase.

These three books reach rather similar conclusions from quite different directions. Australia is presented as searching for its identity and destiny as a pioneer of popular democracy; having lost its way, it now has an opportunity to find itself again. This presupposes that an informed democracy has been frustrated by conservative institutions and attitudes

and can be liberated by suitable political and constitutional changes. As McKenna's study shows, something similar has been urged throughout Australian history. But the drive usually peters out, and the masses sink back into a self-satisfied slumber in a normally peaceful and relatively harmonious society. Certainly, Australians are far better educated than ever before, far better informed through the media, and far more in touch with global trends. Yet, they remain just as likely to view politics as a game, just as likely to be unsure of who they are, and just as unlikely to organize themselves into active citizens, despite ample opportunity to do so.

The Fragmentation of Yugoslavia: Nationalism in a Multi-national State. By Aleksandar Pavković. New York: St. Martin's, 1997. 222p. \$59.95.

Sabrina P. Ramet, *University of Washington*

The Preface promises "to avoid a discourse of moral indignation and condemnation" (p. x) in discussing the 1991–95 war in former Yugoslavia and its prelude. The author also asserts, on the same page, that he finds "nothing appealing in any national ideology, however romantic some of them may appear to intellectuals." Leaving aside the question of whether nationalism holds attraction only for intellectuals—a dubious implication that the author may not have intended—these prefatory remarks incline one to expect a balanced treatment in this book.

What follows is, however, disappointing. The first sixty pages are devoted to 1918–53. Although the author maintains a scholarly tone in these pages, there are already warning signs, such as the omission of any discussion of Chetnik leader Draža Mihailović's collaboration with the Nazis during World War II or of the collaborationist activities of Serb quisling Milan Nedić or Serb fascist Dimitrije Ljotić.

Another sixty pages are devoted to 1953–90. While the reader may obtain a handy summary of events from this section, it is probably not coincidental that Pavković, in referring to the respective aspirations of Croatian and Serbian nationalists in the early 1970s, writes that Croatian leaders Miko Tripalo and Savka Dabčević-Kučar "argued" certain positions (p. 67), while Belgrade legal theorist Djurić "noted" certain facts (p. 71). Implicitly, the reader is already given to understand that the latter's demands were reasonable, while those of the former evidently were not.

In the final section of the book, covering 1990–95, the author's agenda comes into clear focus. At the start of chapter 9 (p. 122), Pavković traces the emerging tensions in Yugoslavia to the alleged fact that "the new Croatian and Slovenian governments were committed to extricating their republics from the Yugoslav federation either by transforming the federation into an alliance of sovereign states, or by unilaterally declaring independence." Left out is the fact that the Croats and Slovenes made this "commitment" in desperation, after Milošević had extirpated the two autonomous provinces but pocketed their votes in the state presidency, overthrown the elected government of Montenegro in a putsch, and begun to demand that Slovenia and Croatia submit to a revision of the federal constitution already drafted in Belgrade. Thus, in Pavković's revisionist history, it was not Milošević who took the country to war, but Slovenia and Croatia!

The bias continues throughout the remainder of the book. Thus, the reader is told of the Croatian government's instructions to the Croatian media but not of the way in which

Milošević's control of television left many Serbian viewers suspecting, during the siege of Sarajevo, that it was Croatian "fascists" and Muslim "fundamentalists" who were shelling the innocent Serbs trapped inside the city. A commitment to balance could have been demonstrated by including this side of the story as well.

In the Bosnian chapter, the author claims that all three sides were arming in 1991–92 but says nothing of the fact that the Bosnian Serbs started arming first and by early 1992 were vastly better equipped than Bosnian Croats and Muslims combined. He implies (p. 167) that the UN declaration of "safe havens" was an anti-Serbian step. In his recollection of the war, moreover, there are only Serbian refugees, and the Serbian side engaged in "self-defense." No Croat or Muslim refugees are mentioned, but there are "Croatian mobs" (e.g., p. 186); I could find no references to "Serbian mobs." Furthermore, when the Serbs reject a peace plan, Pavković expresses his understanding for their concerns; when the Muslims reject a peace plan, he expresses outrage. He even advises the reader in connection with photos taken at the Serb detention camp at Trnopolje that "not all prisoners pictured were starving" (p. 171). Is the reader expected to conclude from this that there was no harm done at Trnopolje? The list goes on and on. In a nutshell, Pavković has produced an oddly one-sided book reflecting the standard Serb nationalist line.

The index omits the names of a number of persons mentioned in the book, such as Tito, although Tudjman, predictably, is amply represented there.

Through Corridors of Power: Institutions and Civil-Military Relations in Argentina. By David Pion-Berlin. University Park, PA: Penn State University Press, 1997. 241p. \$45.00 cloth, \$17.95 paper.

Incomplete Transition: Military Power and Democracy in Argentina. By J. Patrice McSherry. New York: St. Martin's, 1997. 408p. \$45.00.

Paul W. Zagorski, *Pittsburgh State University*

At a certain level, *Through Corridors of Power* and *Incomplete Transition* might be considered complementary. They cover approximately the same period of Argentine civil-military relations (the 1980s and early 1990s) but, with one major exception, focus on quite different topics. While Pion-Berlin concentrates on the issues of rights trials, civilian control of military policy, and the military budget, McSherry is principally concerned with revanchist factions within the armed forces and their attempts to reestablish a domestic—specifically, an internal security—mission for the military. A well-rounded picture of recent civil-military relations in Argentina requires an understanding of the varying positions of the Alfonsín (1983–89) and Menem (1989–) governments on military issues, and this is Pion-Berlin's focus. Yet, the picture would not be complete without an understanding of military reactions to civilian attempts to control the armed forces or an appreciation of the reaction of civil society to the maneuvers of both politicians and military men. This is where McSherry presents the more detailed account.

The events surrounding the human rights trials in the mid-1980s are so obviously important that both books cover them extensively. The general outline of what happened during this period is not a matter of dispute. Although Raúl Alfonsín ran as the presidential candidate most likely to bring the armed forces to book for the up to 30,000 "disappearances" during the "dirty war," he never fulfilled popular expectations. Even his early moves were crafted to prod the

military into self-purification and limited the number of those subject to prosecution. Yet, despite these limited objectives, the military delayed and resisted, and three open revolts in 1987–88 caused the government to backpeddle repeatedly. Eventually, under the Menem administration, the rights violators and those who had rebelled (except participants in the 1990 coup against Menem himself) were given amnesty. The difference in the accounts provided by Pion-Berlin and McSherry lies less in the general history or even the details of the revolts than in their implications and interpretations. The former concludes that the failure of the revolts ushered in a new period of civil-military relations: "The social connections that military conspirators had come to rely upon and had drawn sustenance from were now severed" (*Corridors*, p. 74). The latter describes the revolts as "low intensity coups" that succeeded in imposing "a sort of slow-motion pact or imposition from above" (*Transition*, pp. 226, 229).

It is not surprising, then, that the authors disagree on other important issues as well. Pion-Berlin sees the 1982–83 transition to democracy after the debacle of the Falklands/Malvinas War as a regime collapse (*Corridors*, p. 7), while McSherry argues that it lies somewhere between a "transition by extraction" (in which the armed forces abandon the rules of the military regime but negotiate the transfer of power) and "transition by reform" (in which the rules established by the military regime remain in place) (*Transition*, p. 9). "A central argument of this study," McSherry writes, "is that the volatile civil-military conflicts of the 1980s are best understood as clashes between democratizing sectors and recalcitrant elements of the military security apparatus... in a struggle to define the nature of Argentina's emerging democracy" (*Transition*, pp. 3–4). He goes on to paint a picture of a recrudescing military that successfully reclaimed its core prerogatives and regained political power (*Transition*, p. 7).

Pion-Berlin portrays the armed forces as severely factionalized. He describes the failure of both civilian reformers and uniformed officers to modernize the institution successfully, and he analyzes in detail the conditions that led to budget stringency for the armed forces under both Alfonsín and Menem. To simplify, under Alfonsín low military budgets were largely the government's reaction to persistent armed forces resistance over the rights trials. Under Menem, the military suffered along with other state-funded sectors. Surprisingly, neither the negative policy of "starving the elephant" nor efforts to rethink the mission of the Argentine armed forces in a changing world produced systematic military reform under either government. Units were shifted about; the intake of conscripts and overall strength fell; the purchasing power of officers' salaries declined; and combat readiness plummeted. Yet, old structures and habits of mind remained. While Pion-Berlin addresses the topic of military reform in detail, he pays little attention to a central topic of McSherry's account: military and civilian efforts to establish policies and procedures that would allow the armed forces to intervene in situations of domestic unrest. He does not view these efforts as indicative of a resurgent national security doctrine. Thus, the two books present quite different assessments of military politics in Argentina.

This difference is, in part, foreordained by methodological and philosophical differences. Pion-Berlin takes a self-described combination of a "new institutionalist" and "rational choice" approach (*Corridors*, p. 22). He argues that the national security doctrines—the military theories that sanctioned military coups and the Argentine military's "dirty war" against subversion—are in disrepute (*Corridors*, p. 18). One of his major concerns is for the consolidation of democracy, that is, giving the military's apparently "utilitari-

an" acceptance of subordination to civilian authorities an ethical foundation (*Corridors*, p. 16). Beyond this, he is concerned about building the institutions that will make civilian control truly effective. In contrast, McSherry takes an approach that is both "historical-structural" and "institutional." His overriding concern is the "quality of democracy, rather than its formal procedural elements" (*Transitions*, p. v). And the armed forces he describes are, in fact, not subordinate to civilians, even on utilitarian grounds. As a structuralist, McSherry is much more prone to assert a stronger connection between the most hardline sectors of the armed forces and the interests of the institution as a whole than Pion-Berlin would seem to admit. And, for a similar reason, McSherry tends to emphasize the link between the interests of the military and international capital beyond what the evidence warrants.

The strongest point in McSherry's brief is the united opposition of the armed forces to rights trials. Yet, this unity can be explained on other than structuralist grounds. Given the widespread participation of officers in rights violations, almost the entire officer corps had legal and psychological reasons for opposing the trials, but their unity was both limited and fragile. Even the three military revolts under Alfonsín were directed against the prosecution of officers and did not represent attempts to seize political power. As an Argentine journalist once remarked to me, the revolts represented "trade union actions." Moreover, these rebellions split the armed forces themselves and resonated favorably only with the most extreme and marginal sectors of the Argentine right. And the coup attempt of 1990, which did have grand political objectives, was easily put down.

The armed forces of Argentina are notoriously difficult for outsiders to penetrate and read accurately in any detail. Future historians may well discover clear evidence of the sort of connections among the military rebels, the institution as a whole, and the designs of international and big domestic capital that play a prominent role in McSherry's account. Until then, it is probably prudent to remain cautious about the true scope of such conspiracies. Thus, while both Pion-Berlin and McSherry contribute to our knowledge of Argentina's civil-military relations, the more nuanced presentation of the former is less likely to mislead those who are unfamiliar with the subject.

Redefining Mexican "Security": Society, State, and Region under NAFTA. By James F. Rochlin. Boulder, CO: Lynne Rienner, 1997. 217p. \$49.95.

Maria Lorena Cook, *Cornell University*

Observers of Mexican politics may have longed for a study that joins under a single explanatory framework the diverse problems that have afflicted Mexico since NAFTA's passage: peasant uprisings, heightened crime, economic crisis, political assassinations, militarization, and drug trafficking. James Rochlin's brief but ambitious book tries to do just that by redefining these and other developments as dimensions of Mexican "security" that have emerged in a new, post-NAFTA environment. The author's innovative treatment of security concerns as those that transcend traditional conceptions of military surveillance of national borders or domestic counterinsurgency is certainly welcome. It is also intriguing to explore how new notions of regionalism under NAFTA may redefine security issues. But despite the promise of Rochlin's idea, the cluttered presentation and confused analysis left this reader disappointed rather than enlightened.

The key argument in *Redefining Mexican "Security"* is that

the rise of "neo-liberalism" after 1982 contributed to the erosion of the legitimating myth of Mexican politics, revolutionary nationalism, which in turn forced the state to adopt more coercive measures against its own population. This loss of hegemony of the Mexican state is presented alongside the new disruptive forces exacerbated by regional economic and military integration under NAFTA, such as immigration, drug trafficking, increased militarization, the Chiapas peasant uprising, environmental disasters, and increased human rights violations. The author acknowledges that positive forces, such as the emergence of nongovernmental organizations and transnational networks, are also part of this new regional setting. The net effect on Mexican civil society, however, is to render it fragmented and incapable of articulating a counterhegemonic alternative of politics and economic integration. Rochlin argues that state definitions of security problems and societal definitions, which view security more in terms of the satisfaction of basic needs and quality of life, have become increasingly counterposed. Successful economic integration, he concludes, will only come about once these two conceptions are fused.

Unfortunately, the story lacks focus and conceptual clarity. The category of "security" is so varied and broad as to render the term meaningless. For instance, environmental degradation, human rights violations, neoliberalism, illegal immigration, drug trafficking, the plight of Mexico's indigenous minority, and an incomplete transition to democracy are all discussed here as if they were manifestations of the same phenomenon. Yet, their precise causes and interrelationships are left undefined. At the very least, illegal immigration, environmental decay, human rights abuses, and the impoverishment of Indians predate 1982, the year Rochlin identifies as the beginning of the decline of Mexican political stability. Even if these developments have been made worse by NAFTA, the book sorely needs a more nuanced analysis of how and why this is so.

The mostly descriptive chapters contain oversimplifications and some annoying mistakes. For example, *maquila* is misspelled "maquilla" throughout the book, and the decline of the PRI is directly attributed to a rather abstract "advent of neoliberalism" after 1982 (p. 24), whereas a more accurate and actor-centered view might have given political opposition forces some credit. The author gives a great deal of weight to the role of "legitimizing myths" in the erosion of political stability, at the cost of explaining how specific economic and political developments have undermined support for the PRI and contributed to an increase in security problems. Indeed, the too-frequent references to the decline of revolutionary nationalism make the author seem nostalgic for the "good old days" of import substitution and PRI hegemony. Never mind that those days were marked by electoral fraud, limited citizen participation, and restricted public debate.

Despite the author's claim to offer a novel perspective, reflected in part by the postmodern phrases that litter the book (e.g., "the time/space compression" in reference to technologies such as the Internet), his analysis is surprisingly conventional. Rochlin attributes much of the current crises to the decline of PRI hegemony and the compensating increase of coercive state power, a traditional top-down view of Mexican politics. By comparison, societal actors play a derivative role. Rochlin downplays the important achievements of Mexican civil society in recent years: the growth of a unified leftist party; electoral reforms, including independent oversight of the electoral process; the emergence of a more active and independent print and electronic media; a vast network of nongovernmental organizations; the role of citizens in seeking a peaceful solution in Chiapas; and so on. We are left

without a better understanding of how these more positive developments affect and coexist with the very real problems Rochlin has identified.

We are also left without a clear sense of what is needed to ameliorate these problems in Mexico and of how that change might come about. The conclusion is not only vague but also remarkably moderate. The "fusion between state and societal security" can be achieved with "a functional economic system paired with legitimate political structures" (p. 187). There is no reason to believe that the author is referring to anything other than a capitalist democracy. It is puzzling, therefore, that Rochlin should call this a "fairy-tale scenario of major structural reform" (p. 187), given the modesty of the prescription as well as recent advances in Mexican economic growth and democratization. What is needed, Rochlin says in the final paragraph of the book, is "good government and . . . policies that generate social consent" (p. 190). Unfortunately, the book does not move us beyond this self-evident conclusion to a better appreciation of what such policies should be.

Democracy in Asia. Edited by Michèle Schmiegelow. Frankfurt: Campus Verlag; New York: St. Martin's, 1997. 555p. \$55.00.

James Cotton, *University of New South Wales*

The views of Michèle Schmiegelow on the way democracy in Asia should be understood are clear. In the lengthy Introduction she argues that the trend to democratization is a major phenomenon of our time, and while economic development may have been one cause, cultural forces have also been important. The power and example of Western democracy have played their parts, but the compatibility of democratic values with elements of the traditional cultures of Asia has helped spread democratic standards across the region. This latter point seems to indicate the way out of the impasse of cultural relativism, which Schmiegelow finds implicit in the "Asian values" debate. While the relativism presupposed in the clash of civilizations scenario of Samuel Huntington seems to be reinforced by the rise of fundamentalist movements of various kinds, Schmiegelow is of the view that critical rationalism, informed by insights to be derived from across all cultures, can nevertheless provide a convincing grounding for a preference for democracy. Democracy should be understood not merely in the limited manner of Schumpeter, that is, as a method of appointing governing elites, but also should incorporate normative perspectives.

This book originated in a conference convened in Louvain in 1994. The authors of the 23 chapters are drawn from the international scholarly community and were evidently given some latitude in addressing the general theme. The contributions are arranged in two broad sections, one on religious and philosophical foundations for democracy, one on the historical record of democratization in a range of Asian political systems. Although many authors address some or other of the editor's concerns, for the most part they do not seem to follow the single research program that Schmiegelow's views might have proscribed; some have been content to follow their own interests, and others have disagreed explicitly with some or all of her propositions. There are some gems of historical and institutional analysis—Gilbert Rozman on Confucianism in China and Japan and Greg Barton on trends in Indonesian Islamic thought are especially noteworthy—but there are also some examples of obscurity and even irrelevance.

The general criticism that might be made of the material is

that there is far too much historical detail. Brigitte Piquard offers some interesting observations on the inapplicability of such antinomies as "tradition and modernity" and "religion and secularism" in the political evolution of Pakistan, but much of her 34 pages are concerned with a political chronology. Philippe Regnier's comparison of South Korea and Taiwan devotes most attention to the period prior to the last ten years and fails, perhaps for that reason, to capture the considerable differences in their respective patterns of democratization, a point stressed by Huntington and other students of the third wave. The chapter by Junko Kato on party factionalism in Japan and Italy, though workmanlike, would have been more at home in a collection on comparative party systems.

There are some cases of judgments that are eccentric if not obtuse. Thus, in the only contribution that ranges over the whole terrain, Seizaburo Sato offers the extraordinary ad hoc hypothesis that Singapore's advanced level of development has not fostered further democratization because "it must be that Singapore happens to be of a size which is small enough to permit an effective control of the whole society by one leader as long as he provides an exceptionally capable leadership" (p. 89). And the editor herself sees Malaysia as most emphatically a participant in democracy's third wave as a result of the outcome of the 1995 national elections (p. 38), whereas many commentators have offered quite a different assessment in the light of the decimation of the parliamentary opposition at that election. A little less controversial is the claim, made by Raoul Jennar, that Cambodia's unhappy experience with political competition following the UN-sponsored elections has been the outcome of the practice, by the "Anglo-Saxons," of "a sort of puritanism or democratic fundamentalism" (p. 518) that made no allowance for Cambodia's past or existing state of political consciousness. Finally, though Kingsley de Silva presents a defensible argument on the nature of the continuing communal conflict in Sri Lanka, the 34 notes include 20 with references to other works by the same author, which must be a record in self-citation.

Thanks to the generosity of the Japan Foundation, this diverse material has been made available to the academic community in a single volume. In general it conforms to the standard set by most of its genre, but what makes it somewhat unusual is the format of the editor's concluding chapter. This incorporates sixteen "propositions" that summarize the themes of the book and represent "plausible paths of cognition and action" (p. 534). These range widely over issues in the philosophy of the social sciences but generally defend a multicausal account of democratization that rejects cultural relativism and affirms the normative understanding of democratic practices. Although the propositions are the editor's responsibility, they apparently follow an extensive postconference correspondence with the contributors and thus represent something of a consensus. They are illustrated in a chart (Figure 1, p. 538) "consciously designed to resemble a circuit diagram of a fuzzy logic rice cooker" (p. 533), which may induce puzzlement in some readers.

The Soviet Experiment: Russia, the USSR, and the Successor States. By Ronald Grigor Suny. New York: Oxford University Press, 1998. 540p. \$35.00.

Eugene Huskey, *Stetson University*

"Stalinist culture established what was acceptable or possible, but within that permissible range art could provide emotional and aesthetic pleasure, bring people to tears or laughter, and make them feel good about the lives they lived" (p. 274). One could ban saxophones—as the Soviet Union did in the late

1940s—but not the spirit that leads men and women to make music. In these and other observations in *The Soviet Experiment*, Ronald Grigor Suny reveals the humanity of a population subjected to a century of lawlessness and indignity. To be sure, episodes in Soviet history, such as those recounted in Varlam Shalamov's chilling tales of the Kolyma death camps, could destroy the spirit as well as the lives of individuals. But Russian society exhibited a remarkable resilience and instinct for survival in the face of the relentless campaigns of a messianic state.

If the Soviet experiment bequeathed at least some "usable history" with which to build a new, postcommunist culture and society, it could contribute little of value to a revival of politics in the 1990s. Unlike in Latin America and southern Europe, the transition from authoritarianism in Russia and the other post-Soviet states requires the razing of the entire edifice of political and economic relations. During the last decade, reform-minded Russian leaders have found it immensely difficult to dispose of a history conditioned by a command economy, by the Communist Party's monopoly of political organization and discourse, and by habits of the heart that discourage trust and personal responsibility. Although the author does not explicitly link the past to the present—this is, in that sense, a traditional history text—there is in *The Soviet Experiment* a wealth of material to be mined by those who seek to understand how the burden of Soviet history weighs on transition politics in Russia.

Writing in the tradition of historians such as Moshe Lenin, Suny presents an interpretation of the Soviet legacy that gives as much emphasis to circumstances and human and economic resources as to ideology and elite tactics. It is not history from above or below but history from all over. Making excellent use of the secondary literature on the Soviet era, including some works grounded in recently released archival material, Suny weaves a lucid and convincing narrative across topics as diverse as high politics, agricultural policy, diplomacy, and film. It is a comprehensive, in places almost encyclopedic, history of the USSR. For some, the treatment of Lenin may appear insufficiently critical. Suny takes seriously the prerevolutionary writings of the Bolshevik leader that anticipate the establishment of an egalitarian commune-state. But once in power, Suny writes, "Lenin pulled away from his vision of radical democracy" (p. 124), in part because of the circumstances of a deepening domestic crisis and the receding prospects for a revolution in Europe. Whatever one's view of the relationship between Lenin as writer and Lenin as ruler, there is here a strikingly even-handed presentation of the competing Western interpretations of Soviet political and economic development.

Where the author exhibits a clear preference is in the disproportionate attention accorded the early decades of Soviet rule. The book devotes 350 pages to the first 36 years of the Soviet era—from the revolutions of 1917 to the death of Stalin in 1953—and only 60 pages to the following 32 years, which takes the story to Gorbachev's accession to power. Without question, the years under Lenin and Stalin laid the foundations of the Soviet order. But in a book of more than 500 pages, one would expect a more extended analysis of the Khrushchev and Brezhnev eras, when the Soviet Union came of age. It was during this period that Soviet leaders struggled to satisfy the demands of a more sophisticated society without abandoning the principles of state socialism. A similarly brief treatment of the Yeltsin years leads the author at times into oversimplified and hurried accounts of key events, such as the violent confrontation between parliament and president in October 1993. To correct a minor error in the final section of the book, the Duma has 450, not 550, members (p. 502).

One reason for the underweighting of the last half of the Soviet era is undoubtedly the relative paucity of serious historical research on Soviet rule under Khrushchev and Brezhnev. While graduate students in the last two decades have flocked to the interwar years, encouraged by advisors who are themselves specialists in this period, few have tackled subjects in the postwar era. Indeed, the years between 1945 and 1985 represent a kind of academic no-man's land, falling between the interests of political science and history. For historians, the problem lies as much in the poverty of sources as in the chronological proximity. For all the horrors and brutality of the decades between the wars in the USSR, there were still lively and revealing debates on the pages of contemporary journals. The range of ideas and emotion contained in published materials were far narrower in the decades after World War II. Thus, conducting serious research on most postwar topics requires access to the archives, which have only recently been opened to foreigners.

The Soviet Experiment is a lucid and accessible introduction to the staggering complexity and drama of communist rule in the Soviet Union. Even specialists in the field will find here new detail and insights, especially on long-neglected ethnic issues and on Soviet rule in the Caucasus, the region on which the author is the West's leading scholar. But one may ask whether the end of the twentieth century is, as the author argues, "the right moment to tell the story of the Soviet Union as a whole." Yes, the Soviet Union now has "a beginning, a middle, and an end" (p. xiii). However, it will almost certainly be another generation before we have a mature literature on the last decades of Soviet rule and before we begin to understand how the Soviet experiment fits into the longer sweep of Russian and world history. When and how Russia emerges from its most recent time of troubles will shape our perceptions of Soviet history and our sense of the questions that should be asked about it.

Economic Strategy and the Labour Party: Politics and Policy-Making, 1970–83. By Mark Wickham-Jones. New York: St. Martin's, 1996. 294p. \$65.00.

Mark D. Harmon, *University of California–Santa Cruz*

From 1973 until 1983, the British Labour Party articulated and advocated a series of radical economic policy proposals that together became known as the Alternative Economic Strategy (AES). The AES consisted of six interrelated policy planks that were presented "as an economic strategy aimed at regenerating the British economy and providing the basis for a society built on socialist values" (p. 53). These proposals included the reflation of demand, a substantial expansion of public ownership, formal and compulsory economic planning with privately owned firms, price controls, industrial democracy as part of a strategy to transfer power from private firms, and (after 1975) import controls to prevent a recurrence of balance-of-payments crises and to protect particular industrial sectors.

Wickham-Jones provides the first book-length treatment of the AES—its intellectual origins, the politics within the Labour Party that surrounded it, its consequences for the party, and more broadly what the AES can tell us about the prospects for social democracy. While a good deal of excellent work has been done in recent years on Labour Party politics in the 1970s and 1980s, on constitutional reform, on factionalism, on the rise and eclipse of the Labour Left, and so on, this book is distinct in its focus on the AES as the primary object of study. For a variety of reasons, Wickham-Jones argues, the AES is important: "It marked a departure

for the Labour Party [and] . . . represented a fundamentally different economic strategy based on a new theory with fresh objectives distinct from its predecessors" (p. 6). It is relevant to any analysis of the Labour Party's social democratic commitments, it is indicative of the kind of party organization that developed in Labour after 1970, and it is important because its adoption had significant consequences for Labour (pp. 6–7).

The overall argument has several parts. After demonstrating that the AES constituted "a qualitative break with Labour's Revisionist past" (p. 7), Wickham-Jones argues that "whatever the formal content of party policy documents, most of Labour's leaders did not reconcile themselves to the AES . . . I demonstrate that the institutional character of Labour and its pluralist nature were important in allowing this divergence to occur . . . [and] that the disunity which became endemic in Labour with the failure of its leaders to accept party policy was the chief cause of the left's demands to reform the constitutional nature of the party [after 1979] . . . I conclude that any analysis of Labour's decline must examine the internal determinants of the party's crisis as well [as] the external causes" (pp. 7–8).

The Labour Party's policymaking structure during this period is crucial to Wickham-Jones's account of how the AES emerged. Because of the generally acknowledged economic policy disappointments of the 1964–70 Labour government, led by Harold Wilson, the party when it went into opposition took on the task of rethinking its revisionist/Croslandite policy orientation of the 1950s and 1960s (see Anthony Crosland, *The Future of Socialism*, 1956). Policymaking subcommittees were established that "became a direct part of the policy process" (p. 120). The Labour Left was able to dominate these committees and to pull party policies in a more radical direction. While Tony Benn became the most outspoken public advocate for the AES from the mid-1970s onward, it was most notably Stuart Holland, an economist at Sussex University, who provided the theoretical work on Labour's policymaking committees that underpinned the AES, especially on the public ownership and economic planning proposals (see Stuart Holland, *The Socialist Challenge*, 1975). The Labour Right was outnumbered and, in any event, tended to be marginalized because of its support for Britain's Common Market membership (the official Labour position in the early 1970s was to oppose joining Europe).

Also important to Wickham-Jones's argument is the divergence in views between the Left-dominated policy committees in the party and the more revisionist Labour leadership in the Parliamentary Labour Party (PLP). Because of Labour's organizational structure and broader trends within the party, the PLP was unable to dominate the development of party policy. Given that the PLP was generally disapproving of the leftward drift of policy during this period and that party activists were intensely suspicious and distrustful of Labour's leadership in Parliament, the two were frequently at each other's throats. (Labour Chancellor of the Exchequer Denis Healey once quipped that party leftists were "out of their tiny Chinese minds.") There was sharp conflict over the 1973 commitment in *Labour's Programme 1973* to nationalize "around 25 of the top 100 firms" (p. 63). When Labour was in power from 1974–79, there were repeated party conference resolutions critical of the government for its failure to carry out party policies (pp. 150–4). When Labour went into opposition again in 1979, the sense of betrayal felt by the party vis-à-vis the PLP was a primary cause of the bitter and fratricidal internal debate that followed over the party's

organizational structure; "the overriding reason for reform, leftwingers argued, was the need to render the party leadership accountable" (p. 158). Wickham-Jones argues that this internal party conflict "did great electoral damage to Labour . . . The bitterness and factionalism meant that Labour ceased to present a credible image to voters" (p. 204). The most damaging split of all occurred in 1981, when prominent right-of-center Labour MPs and former ministers left to form the Social Democratic Party and Labour's position as the main opposition party to the Conservatives was threatened.

Wickham-Jones has conducted interviews, made ample use of the relevant memoirs and secondary literature, and carefully sifted through the research papers and minutes of committee meetings in the Labour Party's files to put together his argument. His judgments about the development and consequences of the AES are usually fair and astute. That said, I found two weaknesses that undermine the overall effort.

First, Wickham-Jones accepts the point that the AES on its own merits was a viable economic strategy for a modern industrial economy and that Labour's failure to implement the AES while in power was primarily because the party was disunited (p. 206) rather than because the AES was impractical or perhaps even unworkable. He argues that "the AES would have required adaptation, but a reformed yet radical version might have been the basis for a feasible economic policy" (p. 197). I am more skeptical regarding the potential of the main elements of the AES—expansion of public ownership, compulsory planning agreements, import and price controls, and so on—to foster dynamic conditions of economic growth in an increasingly globalized economy. Wickham-Jones is overly generous with respect to the AES when he concludes that the question of whether it met its objectives remains "unanswered" (p. 197).

Second, because of the organizational structure of the argument, the broader economic environment confronted by the Wilson/Callaghan governments in the 1970s is usually discussed apart from the AES and seems underemphasized within the narrative. For example, in Wickham-Jones's discussion of the party proposal that was passed by the 1976 Labour Party conference to nationalize the big four clearing banks, seven large insurance companies, and one merchant bank (p. 65), no mention is made that the government at the same time was announcing its application for a conditional IMF loan in order to cope with the sustained loss of investor confidence made manifest in the steady slide in the sterling exchange rate. The broader economic environment was extraordinarily hostile, and it is important to keep in mind when discussing the 1974–79 Labour government's failure to implement the AES that this was a period of high inflation (more than 20% in early 1975), repeated and heavy selling pressure on sterling, a difficult and painful conditional loan from the IMF, problematic annual negotiations with the trade unions over incomes policies, and finally an explosion of industrial relations conflict that shattered the government's assertion that it could effectively manage the unions. Attempting to implement AES policies would have been difficult under the best of economic conditions, and the 1970s were far from the best.

These more critical points notwithstanding, this book should be of interest to specialists in British politics and in social democracy and, more generally, to anyone interested in the politics of the Left in advanced industrial societies. It is carefully researched, engagingly argued, and concerns an important period in Labour Party history that we are unlikely to see again.

International Relations

War and the Red Cross: The Unspoken Mission. By Nicholas O. Berry. New York: St. Martin's, 1997. 159p. \$35.00 cloth.

Larry Minear, *Brown University*

The central issue in today's widely ranging but still jumbled debate about humanitarianism involves its relationship to politics. The debate engages the UN Security Council and General Assembly, UN member states, parliaments and administrations of donor and recipient governments, the concerned international public and the media, and, of course, humanitarian agencies themselves.

Some aid organizations, with the International Committee of the Red Cross (ICRC) in the vanguard, embrace the classical principles of neutrality and impartiality. Life-saving assistance and protection, in their view, should be provided to persons in ways thoroughly divorced from any and all political objectives and conditionalities and solely in proportion to the severity of need. The ICRC acknowledges that its aid work on the ground and its advocacy of humanitarian imperatives at the local and international political levels have political effects and implications, yet it does not see itself as a political actor as such. It keeps its distance from efforts to use humanitarian aid to achieve political objectives, however supportable they may be in their own right. If emergency aid can be an instrument for healing tensions, then well and good, but that should not be its purpose, and it should not be withheld in exchange for better behavior among belligerents.

Other humanitarian organizations are, by their own terms of reference and/or by their scripts, directly engaged in the political sphere. Although working to provide assistance in proportion to need, they are not neutral with respect to belligerents, some of which have more legitimate claims than others, or with respect to war, a plague against humanity. Indeed, such groups, including some nongovernmental organizations (NGOs) and some UN agencies, affirm an obligation that entails explicitly political tasks. They seek not only to ameliorate but also to prevent suffering by addressing its underlying causes: ethnic tensions, racism, conflicts over resources, warlordism, criminality, and, above all, war and injustice. Such groups, with increasing support and pressure from the UN and governments, situate their emergency relief and protection activities squarely within the broader ambit of conflict prevention and conflict resolution. Their work is part and parcel of the UN's peace agenda and of international efforts to bring violators of international law to justice and to rebuild war-torn societies along democratic and participatory lines.

In *War and the Red Cross: The Unspoken Mission*, Nicholas Berry positions the ICRC, the most omnipresent source of succor in today's complex emergencies, with a foot in both camps. Berry portrays the ICRC as continuing to embrace, as it has since its inception, impartiality and neutrality in assisting the victims of war without regard to ideological considerations. At the same time, however, he is convinced that in recent years the ICRC has been engaged in a secret and highly political mission: the abolition of war. He bases his contention on ICRC documents and numerous interviews with ICRC officials, quoted at great length. He finds further evidence of the secret mission in his review of the organization's activities in conflicts in former Yugoslavia, Rwanda, the Sudan, Afghanistan, and Guatemala.

While presented with the flair of a mystery writer, Berry's thesis and documentation are flawed. His central hypothesis fails to distinguish between political objectives, which the ICRC disavows, and political effects, which it acknowledges.

Berry is correct in observing that all humanitarian actors and activities in today's complex emergencies have political effects, although these are often soft-pedaled by the aid agencies themselves. These include, as he enumerates them, monitoring—and thereby deterring—the levels of violence, helping to stalemate wars, serving as neutral intermediaries between the parties, and pressing for intervention by the UN and outside governments. Yet, to construe such activities as evidence of an "unspoken new mission [that] is nothing less than the sabotage of war" is not borne out by either ICRC theory or practice.

Berry is surely also correct in delineating the close connection between the institution of war and the work of the ICRC in assisting and protecting its victims. "Humanitarian intervention," he rightly notes, "upsets the natural flow of war," although he goes too far in suggesting that such intervention takes war "out of the control of the warring parties," as those who manage Operation Lifeline Sudan or other such interventions will attest. The sum total of activities by the ICRC and other international humanitarian agencies does indeed make it harder to wage no-holds-barred war. As custodian of the Geneva Conventions and Protocols and promoter and disseminator of international humanitarian law, the ICRC is itself at the forefront of global efforts to humanize—that is, to delimit—war making. "War was the making of the Red Cross," observes Michael Ignatieff in his own study of these issues, "and it is at the heart of its complexity as an institution that war remains its reason for being" (*The Warrior's Honor: Ethnic War and the Modern Conscience* [New York: Metropolitan Books, 1997], p. 119).

Yet, however much ICRC activities may constrain belligerents and however strongly individual ICRC staffers may wish to end today's uncivil civil wars, the organization itself is not committed, even implicitly, to the abolition of war itself. Were that the case, its humanitarian activities within armed conflicts would at once become politically suspect. The relationship between war and humanitarian action is captured more faithfully in the more generic observation of analyst Hugo Slim that, "as it has developed next to war through the centuries, humanitarian assistance is much more a priestly rite of cleansing and boundary setting in war than a prophetic movement of political and social challenge to war itself" ("Sharing a Universal Ethic: Spreading the Principle of Humanity Beyond Humanitarianism," address to a conference sponsored by the European Community Humanitarian Office (ECHO) and the Overseas Development Institute, "Principled Aid in an Unprincipled World," April 7, 1998, p. 2). Moreover, available evidence hardly supports Berry's contention that "war is becoming obsolete." The ICRC itself has even been criticized for the opposite result: that humanizing war, rather than abolishing it, renders war more acceptable.

Precision, which is of the essence in traversing the humanitarian and political interface, is quite absent in this volume. Berry's presentation and analysis of data lack rigor and discipline. The ICRC is introduced as one NGO among many, ignoring its special status. Yet, the ICRC is not "the only NGO accredited to the UN, allowing it to voice its opinion directly and giving it access to meetings of the General Assembly and committees." Lengthy excerpts from ICRC documents and interviews, off-putting in their intrusiveness, do have the value of allowing the reader to render independent judgment about the author's conclusions. Berry's thesis leads to other proof-texting distortions as well: for example, the treatment of the NGO Code of Conduct as an antiwar tract rather than a set of principles for humanitarian operations. Although the ICRC did play a role in interna-

tional efforts to end the conflict in former Yugoslavia, an Oscar for best supporting actor would be inappropriate.

In sum, the book highlights the complex interaction between humanitarian action and the political realm. Yet, its treatment of that interaction reflects the confusion in the current debate about humanitarianism and politics rather than contributing to a long overdue understanding of the key issues and options.

Africa and the International System: The Politics of State Survival. By Christopher Clapham. New York: Cambridge University Press, 1996. 340p. \$59.95 cloth, \$19.95 paper.

William J. Foltz, *Yale University*

In this major contribution both to our understanding of African politics and to our understanding of the interplay between the international system and its weakest members, Clapham gives us a view of international politics from the bottom up. His focus is on how African leaders have sought to extract resources from the international environment in the attempt to survive. Their task has never been easy, and in Clapham's reckoning not only the leaders but also their states face even harsher struggles for survival in the post-Cold War era.

Clapham builds from Robert Jackson's (*Quasi-States*, 1990) view of African states as "juridical states," demarcated and defined by international convention and dependent on the Westphalian order for the sovereignty that gives their rulers standing to bargain in the international system. Their legitimacy and sovereignty are externally vouchsafed, whatever may be their relations with the peoples living within their official borders. That sovereignty in turn provides a "bargaining counter" with which African leaders hope to extract economic aid, political support, and weapons with which to enhance their ability to hold onto power. Such support could consort with a neopatrimonial internal political and economic order that could give the regime monopoly status without ever effectively penetrating or mobilizing the energies of ordinary peoples through a serious process of nation-building.

The Cold War provided an ideal environment in which African leaders could seek external resources without embarrassing questions being asked or encumbering conditions being imposed. The regimes most confident of their domestic base and regional security could abjure the extra protection and play the nonaligned game; most African leaders found it expedient to tilt one way or the other, depending on opportunity and need. (The West was a better source of money, the Soviets of arms.) The 1977 reversal of alliances when Ethiopia and Somalia exchanged superpower patrons demonstrated how labile ideological commitment could be. In turn, the Cold War's end—"overwhelmingly greeted by African rulers with regret" (p. 159)—took away much of the leverage African states possessed and left the field clear for the state-transcending forces of globalization.

The international community's continued support for the juridical states was overmatched by disaggregative pressures. The international financial institutions insisted on shrinking the state while subjecting what was left to external supervision and "conditionalities." Bilateral economic aid was increasingly funneled through NGOs, many opposed to the regime in power. What had been state services, such as health and education, were privatized or devolved to regional or local bodies. International organizations, the UN High Commissioner for Refugees most notably, came to exercise de facto responsibility for the survival of millions of people.

Insurgencies multiplied. For the African states' inability to withstand these pressures, Clapham faults their dismal economic performance, which has driven economic activity underground and out of the state's grasp, and which has curtailed, petroleum aside, whatever international investment interest there might be. Clapham puts "corruption" at the center of his explanation for economic failure, although well-meaning incompetence plays its role, ranging from the "awe-inspiring stupidity" (p. 170) of Tanzania's development schemes to the Organization of African Unity's "economically illiterate" (p. 176) Lagos Plan of Action for an African Common Market.

African leaders' maneuvers to stay in power provide the entry point of Clapham's analysis, and their responsibility for current woes gets pride of place. None of the significant actors comes off well, however. Among the former colonial powers, France is faulted for its support of corrupt francophone tyrants and its aggravation of civil wars in Nigeria, Liberia, and Rwanda. If France has acted like an interfering parent, then Britain has been a neglectful one, seeing Africa "as a source of trouble rather than opportunity" (p. 88), an attitude that British officialdom extended to Lonrho, the one British firm closely involved with a number of African governments. Yet, as Clapham points out, the legacies of the lesser colonial powers are worse. Whereas several of the former French and British colonies have had serious troubles, every single African country not colonized by Britain or France has had a "dramatically greater level of insecurity" (p. 85). As for the superpowers, the best that might be said is that during the Cold War the African leaders found them easier to manipulate than the former colonial powers.

African insurgencies are dealt with in a particularly acute chapter. For Clapham, these are the "ultimate proof of the failure of monopoly statehood" (p. 209) and are part and parcel of the failure of the African state system. While insurgencies have domestic roots (only Mozambique's Renamo was evidently external in origin), they are dependent on external support. It is neighboring states, not outside powers, that provide the key support. Few of these insurgencies live up to Mao's romantic image of fish swimming in a sea of peasant support; most have victimized whatever local population was unlucky enough to find itself in an operational area. (The successful Ethiopian and Eritrean insurgencies may be exceptions to Clapham's strictures.) The norms and executive weakness of the OAU and other structures of the African state system have rendered them nearly incapable of dealing with the challenge of insurgency, Clapham argues. The recent, and perhaps transient, success of the Nigerian-led interventions in Liberia and Sierra Leone may open room for a slightly more hopeful judgment, as may the unprecedented Franco-Anglo-American cooperation in equipping, training, and providing logistical support for units of selected African armies for eventual peacekeeping duties. Still, one can hardly dispute Clapham's judgment that just as the insurgencies overwhelmingly resulted from internal factors, so they likewise must be settled internally.

Clapham's book is not written in the language of international relations theory, but theorists will have much to learn from it. State-centric neorealism has little relevance to a world in which the interests served by political action are narrowly those of the leader. Leadership, seeking to maximize and eternalize its grip on power, serves the state only coincidentally; statehood, however, is the rapacious leader's prime resource. Clapham urges greater attention to, in effect, "second image reversed" analysis of the domestic political effects of international structure. He also calls for focusing on the struggle for control of resources flowing across state

boundaries. A new field beckons to the theoretical and empirical researcher alike: the international relations of statelessness.

New Thinking in International Relations Theory. Edited by Michael W. Doyle and G. John Ikenberry. Boulder, CO: Westview, 1997. 296p. \$69.00 cloth \$25.00 paper.

Robert W. Cox, *York University*

This book implicitly reaffirms what Stanley Hoffmann wrote over two decades ago, that international relations (IR) is an *American* social science [*Daedalus* 106(1997):41–60]. Not only are the contributing authors all Americans, teaching in American universities, but the frame of reference of discussion concerning IR theory is also specifically American. Among the names of noncontributors prominent in the index are (in no particular order) Keohane, Gilpin, Ruggie, Katzenstein, Krasner, and Waltz. The issues for debate have been defined by these scholars; and the newer generation of contributors to this book have joined in the debate with the aim perhaps of broadening its range, considering alternative answers to the questions raised and, in particular, introducing a concern for understanding “change.”

Within the limits of this intellectual framework, the book has considerable merit. Miles Kahler’s excellent chapter on the postwar history of IR theorizing in the United States takes reflective distance from its object in discerning the forces shaping this theory: the demand from government and foundations for knowledge to match the new global interests of the United States (p. 28), which made influencing the minority that shapes public opinion the primary goal of theorizing (p. 29). He links the individualist rationalist models that became a feature of this theory with a traditionally American ahistorical liberal exceptionalism (p. 39).

The book signals a late entrance to the American debate by postmodernism and feminism. The ironic self-deprecating notes struck occasionally in James Der Derian’s chapter suggest a lingering uncertainty about postmodernism’s acceptance as a “dialogical” partner, the concept of “dialogism” being derived from the Russian literary theorist Mikhail Bakhtin. The monologue, for Bakhtin, is the single acceptable framework of discussion to which all participants must conform if they are to be admitted to the debate (what the French call *la pensée unique*); dialogism accepts a plurality of discourses each continually generating new meanings and new identities. Der Derian thus potentially undermines the *American* character of IR as a social science by postulating a plurality of realisms for a multipolar and multicultural IR (p. 57).

Jean Bethke Elshtain continues this theme with a critical review of the classic foundations of the dominant IR discourse. She argues that the contemporary neorealist readings of Thucydides and Machiavelli are one-sided whereas these classics of theory are open to alternative and more complex readings that, in the case of Thucydides, see the relations of states as shaped by forms of knowledge and civic identity rather than by some essential quality of “stateness” and, in the case of Machiavelli, which bridge the dichotomy of public and private. The gender factor for her is not a question of “adding women” but of discarding the genderless rational actor model in favor of greater awareness of modes of social organization and the perspectives of subjectivity.

From here on only Matthew Evangelista looks seriously within the encasement of the state to examine the link between domestic structures and international behavior in a very clearly written chapter. Daniel Deudney seeks to revive

interest in geopolitics. While acknowledging German sources, he assimilates geopolitics to the vocabulary of American social science by defining it as a “structural-functional security materialism” (p. 93). He would bring “nature” into the calculations of IR theory—nature considered not only as factors like climate and access to the sea but also nature as modified by technology. “Materialism” for this author is the interaction of geography and technology (p. 100). James De Nardo makes a fairly complex attempt to explain why mathematical modeling does not yield definitive conclusions for policy. His answer is that models rely on the assumption that both sides in a conflict perceive the world in the same way (p. 136), an assumption (we may add) that anyone taking a dialogical position (Der Derian, above) would have rejected at the outset. He concludes with the rather minimalist justification that the benefit of modeling is to underline the complexity and uncertainty of things (p. 156).

Joseph Grieco seeks to reaffirm realism—although what he calls realism seems more like American neorealism than the realism of, for instance, an E. H. Carr—while acknowledging that there are some problems in explaining why states invest time and resources in international institutions like the European Union, and in knowing whether, given the posited condition of anarchy, states will seek to maximize either security or power (or whether perhaps they amount to the same thing). Steven Weber argues, beyond Grieco’s realism, that states pursue not just interests but purposes that are infused by ideas and values, and this is what leads them to join with other states in creating international institutions, institutions which are thus endowed with a distinct ontological status, no longer to be considered as just part of the environment in which rational-actor states pursue their particular goals.

Since this book is intended to be assigned in international relations theory courses it is important to consider its implications for the understanding of the world by a coming generation of Americans who will have something to say about America’s role. In this regard some serious questions arise. Does it focus attention on the problems the world faces and what the United States can and should (yes, there is a moral question that cannot be evaded by a commitment to “science”) do about them? Does it lay down an approach to knowledge that would be conducive to confronting these problems?

The “American social science” of IR has had these features: (1) an aim to constitute an “objective” science that would include testable generalizations of universal application about politics beyond the domestic level; (2) a separation of political and economic spheres, which means that social conflict and cleavages arising in the economic sphere are excluded in favor of “interests” that are an acknowledged part of the political; and (3) a definition of “reality” in world politics as something that is knowable in the same way by all rational observers. This set of assumptions, viewed historically, may be seen as characteristic of the eighteenth-century Enlightenment thought in which American political institutions and the tradition of American political thought were conceived. They have been accentuated by recent decades of Cold War in which the European alternative of Marxism has been anathematized, effectively excluding that rival form of knowledge.

Even though the United States has emerged as the greatest single state and societal power in the world, that power is probably not great enough to organize the whole world in its image. The question is, then, whether the coming generation of American thinkers about world affairs does not in the first instance require a deep awareness of the different modes of

thought about the nature of world problems to be found in other coexisting and developing cultures and civilizations—in other words of the different “realities” that confront one another.

Taking this approach would also yield a different sense of problem priorities from those discussed in this book. The polarization of rich and poor, not just among but within countries, developed and less developed, would loom as a principal problem of world politics. Elshtain, in this book, points to the effects of the separation of public and private but none of the authors discuss the consequence of the separation of the economic from the political in allowing free rein to economic power to dominate and deprive, thereby creating conditions of political instability.

Deudney introduces “nature” but neither he nor any other contributor to the book considers the problem of the biosphere as the ultimate material constraint on politics and economics. Perhaps the explanation of this gap is embedded in ideology. Just as social cleavage may have been marginalized in IR thought by the anti-Marxism of the Cold War, so ecology may be set aside for economic reasons as posing a threat that it could revive claims analogous to those of the aborted New International Economic Order of the 1970s—cost-raising constraints upon global economic expansion.

The editors, in conclusion, suggest that “it is necessary to look more deeply into the character of societies and states to find out how they construct goals and expectations” (p. 278). Unfortunately, the book does not go very far in this direction toward an emphasis on the development of civil society as the foundation for new political authorities from local to global levels.

Perhaps what is most needed for a radical understanding of “change” in the condition of world order is a retreat from the constraints of the persistent attempt to emulate the physical sciences and a new openness to a more historically based interpretive or hermeneutic understanding which would broaden considerably the range of disciplines that have a contribution to make. History (e.g., Fernand Braudel), anthropology (e.g., Karl Polanyi), economic history (e.g., Harold Innis), and the classics of social and political theory (e.g., Max Weber and Karl Marx, going back even to Ibn Khaldun, Machiavelli, and Gianbattista Vico) still have much to offer as guidelines for understanding historical change in which the level of state interactions cannot be meaningfully separated from the total process. One would hope that alongside books like the one reviewed here students of IR would be exposed to readings from outside the specifically American theorizing of IR. As examples, see Susan Strange, *The Retreat of the State* (1996), and Bertrand Badie and Marie-Claude Smouts, *Le retournement du monde* (1992), both of which in different ways expand the scope of power relations beyond the interstate sphere and focus on vital problems that are largely obscured in the narrower lens of conventional IR theory.

Strategic Assessment in War. By Scott Sigmund Gartner. New Haven, CT: Yale University Press, 1997. 256p. \$30.00.

James J. Wirtz, *Naval Postgraduate School*

Although operations research often shapes how militaries conduct war, scholars have not paid much attention to the way military establishments employ quantitative analysis to evaluate strategy and policy. This state of affairs is perplexing, given the statistical and analytical dexterity often displayed by political scientists, for instance, on the pages of the *APSR*. Maybe “systems analysis,” Robert McNamara’s effort to use statistical indicators (body counts, aircraft sortie rates) to

gauge progress in the Vietnam War, was so politically and strategically disastrous, that it discredited study of the effect of military operations analysis on organizational and state behavior. Alternatively, those interested in explaining the behavior of military organizations generally eschew quantitative methods. Not surprisingly, their analyses of the way organizations develop and modify strategy often gloss over the effect of statistical indicators as an independent variable influencing organizational behavior. Realism, bureaucratic politics, and strategic culture are preferred explanations in accounting for the origins and implementation of military doctrine and operations.

Strategic Assessment in War thus represents an important and overdue contribution to the extensive literature on the way military organizations select and assess strategy in wartime. In Scott Gartner’s view, organizations do not judge their performance by surveying the universe of available data; instead, they select “dominant indicators” (measures of effectiveness) to assess progress toward achieving organizational objectives. These measures of key aspects of the operating environment are often unique to specific institutions because they reflect organizational cultures, missions, and goals. Gartner also suggests that decision makers do not use dominant indicators as a sort of cumulative index to judge the success and failure of their policies. Officials estimate the prospects for success by monitoring positive or negative trends in dominant indicators and the direction and acceleration of these trends. In other words, bureaucrats could believe that a deceleration of a positive trend is more alarming than a negative trend that does not appear to be worsening.

To demonstrate the usefulness of his decision-making theory, Gartner describes four instances in which organizations reassessed their preferred strategy in light of battlefield developments: British anti-submarine warfare in World War I and World War II; the debate about U.S. policy in Vietnam following the 1968 Tet offensive; and the Carter administration’s deliberations during the hostage ordeal in Iran. Gartner’s theory works best when applied to the way a particular institution interprets events. For example, in the aftermath of the Tet offensive, army officers were encouraged because Tet produced a sharp jump in the rate allied forces were inflicting casualties on North Vietnamese and Viet Cong units. This represented an acceleration of a positive trend in the dominant indicator that the army was using to measure progress in the war. Others in the Johnson administration and, for that matter, the American public were more concerned about the sharp increase in the rate American units suffered casualties during Tet. As a result, the army’s claims of victory in spring 1968 were difficult to comprehend for many Americans both in and out of government.

The policy debate following the Tet offensive also demonstrates the limits of Gartner’s approach. What broke the back of the Johnson administration’s commitment to Vietnam was General William Westmoreland’s post-Tet request for about 200,000 additional troops. General Earle Wheeler, Chairman of the Joint Chiefs of Staff, apparently encouraged Westmoreland, who commanded American forces in Vietnam, to make the request. Wheeler was concerned because the army lacked reserves for additional contingencies; all available forces had been sent to Vietnam. The troop request would have forced President Johnson to call up the reserves, a politically charged decision that Johnson had sought to avoid. The army’s claims of victory, the call for additional forces, and the prospect of a reserve call-up, created a political fire storm, leading Johnson to announce that he would not seek another term as president. Although Gartner’s theory of

decision making helps to identify the context in which various players viewed events in Vietnam, it cannot capture the rich interplay of competing political positions and policy preferences that shape governmentwide policy outcomes.

Gartner's work represents an important theoretical contribution to the literature on bureaucratic policymaking for both political scientists and systems analysts. In terms of operations research, it suggests that organizational culture influences the way people select and use measures of effectiveness to evaluate institutional performance. For political scientists, it can explain when organizations will identify some event as a problem or opportunity, and it helps to explain the context used by organizations to view their domain. Gartner also offers a key methodological insight in warning against placing too much analytical emphasis on the cumulative effect of battlefield activity, a measure of effectiveness which appears persuasive in hindsight but is of less significance to officials struggling to overcome an ongoing problem. Gartner probably asks too much of his theory to explain outcomes that reflect many competing political currents and interests, but his approach does identify the "statistical" context of political debates. Indeed, the selection of measures of effectiveness can only take on increasing importance in an information age, a time when the cost of collecting and analyzing quantitative data is diminishing.

China's Security: The New Roles of the Military. By Mel Gurtov and Byong-Moo Hwang. Boulder, CO: Lynne Rienner, 1998. 349p. \$59.95.

David Lai, *University of Colorado*

China is determined to regain its national strength, national unity, and international prestige. This book is about the People's Liberation Army's (PLA) role in this mission. Gurtov and Hwang have provided an excellent account of the Chinese military establishment, its relation to the Chinese Communist Party (CCP) and China's foreign policy. They have also shown how economic and technological development and domestic and international factors have substantially reshaped Chinese military thinking and behavior. This is one of the best books about China's military published in the 1990s. It is a must-read for students of China politics.

The authors begin with an insightful analysis of the Chinese civil-military relations. In China, the ruling party commands the gun. Leaders of the party and the military are so interconnected, however, that the party and the military are in essence an organic whole with no separate and competing interests. As such, Gurtov and Hwang are correct to point out that conflicts between high-level civilian and military leaders are intraparty elite conflicts. Accordingly, occasional PLA intervention in domestic politics results not from party-military conflict but from intraparty debate and decisions. In this sense, military involvement in domestic politics is a stabilizing action. Furthermore, the PLA is much more than a fighting force. It has served a whole range of domestic, political, social, and economic functions. It is the party's important instrument for Chinese politics.

With a clear delineation of the party-military relationship, Gurtov and Hwang proceed to discuss Chinese military thinking and the approaches in national defense (the authors call them doctrines). Since the founding of the people's republic, China has had a national defense policy of active defense. The people's war doctrine lays the foundation for this policy. It emphasizes the following principles: primacy of politics, primacy of people over weapons, the strategy of using a weak force against a strong force, the mobilization of

the masses to fight a protracted war against invasion, and multiple roles of the PLA.

The people's war doctrine came out of the Chinese experience against foreign invasions. In the past, the Red Army was weak and could not prevent its enemy from invading China; however, the Chinese people had a great capacity to endure the initial suffering from the invasions. The CCP eventually led them to defeat their enemies through protracted guerrilla warfare. Times have changed. The Chinese military today is much stronger. China now finds it possible to stop potential enemies at the borders and even deter them from contemplating an invasion. Deng Xiaoping and other top leaders in 1981 modified this old doctrine, dropping the part about luring enemies deep into the Chinese territory and then waging a people's guerrilla warfare against them. Today, active defense means confronting enemies in the outer stretches and stopping any advance before an incursion in China's territory.

Gurtov and Hwang have carefully documented the evolution of the new military thinking and the modifications made to the people's war doctrine in the last two decades. They have shown that Chinese military leaders have expanded their strategic thinking from the traditional geographical territory (primarily the land) to strategic boundaries of the so-called three-dimensional frontier, with more attention given to the ocean outstretch and outer space. The Chinese navy, for instance, has advanced an offshore active defense approach, which allows it to exert greater control over a vast ocean front surrounded by Korea and Japan in the northeast and the ASEAN (Association of Southeast Asian Nations) nations in the south. This approach has allowed the Chinese military to put new pressure on Taiwan. It has also put a backbone in China's diplomatic dealings with the ASEAN nations over the South China Sea islands.

The Taiwan issue and the disputes over the South China Sea islands are in fact test cases for China's new military doctrines. Gurtov and Hwang include an excellent discussion of these two cases in chapter 8. The authors point out that the ways in which the Chinese deal with the Taiwan problem and island disputes are embedded in a multitude of other issues: China's national unity and sovereignty, Chinese domestic politics, China-U.S. relations, and China's regional relations. The military's role is especially significant in these areas. Yet, while Chinese military has made some headway in its offshore active defense, its experience in these areas has also exposed the weaknesses and limitations in the PLA's offshore fighting capabilities. It is believed that a full-fledged offshore active defense is still decades away.

In addition to the fundamental issues mentioned above, Gurtov and Hwang have three interesting chapters on issues that are of interest to outside observers. These are the Chinese military's involvement in China's economic reform. Through these three chapters (5, 6, and 7), Gurtov and Hwang discuss the issues and problems in China's defense industry and armament production and sales. The authors have shown that the effect of China's economic reform on the military behavior is mixed. While the military has derived some limited income from its economic activities and made some headway in military-civilian production conversion, the PLA has been drawn into a money-making business. This erodes the discipline and morale of the PLA. As I am writing this review, news from China reports that Jiang Zemin and the top leaders have launched a campaign to crack down on corruption in the military's economic dealings and scale down the military's business ventures.

The rise of China and its implication for world affairs have been a subject of debate in the last several years. At issue is

whether this rising China will be a militant one. Critiques in the West are quick to put forward a China-threat thesis. They charge that as its power base expands, China is bound to be more aggressive on a whole range of issues such as Tibet, Taiwan, territorial disputes over the South China Sea islands, military modernization, armament development and sales, and military competition in open seas and outer space. Led by a cover article in *The Economist* in August 1995, advocates of the China-threat thesis have been calling for containment. They charge that if not stopped or at least constrained, a rising China is bound to pose a great security threat to its neighbors and ultimately come into conflict with the United States.

Gurtov and Hwang did not write this book to join the debate. Their findings, however, compelled them to reject the China-threat thesis. They point to the fact that instead of menacing its neighbors, China has normalized relations with each of them. In the coming decades, China's priority is economic development. It needs a peaceful international environment. China's military will be more essential in stabilizing the mounting domestic political and social problems than external adventures. The fundamental national-security function of the PLA is to safeguard China's territory. Defense of the country's lengthy borders and protection of China's sovereignty are therefore the PLA's key missions. Furthermore, the PLA has numerous serious weaknesses acting as constraints on its external ambitions. China is going to be more assertive on international issues. This is normal for such a big power. However, a more assertive China is not necessarily a militant one. The two authors warn against the trap of Cold War thinking.

Sovereigns, Quasi Sovereigns, and Africans: Race and Self-Determination in International Law. By Siba N'Zatioula Grovogui. Minneapolis: University of Minnesota Press, 1996. 282p. \$54.95 cloth, \$21.95 paper.

Leonardo A. Villalón, *University of Kansas and Université Cheikh Anta Diop de Dakar*

The ambiguities in the notion of sovereignty and the limitations on the independence of the former colonies which acceded to the status of autonomous states in the post-World War II wave of decolonization have posed interesting analytical problems for political scientists attempting to understand the fate of Africa. While earlier theorists of "dependency" and of "neocolonialism" described the limitations on African independence in terms of the historical insertion of the continent into the international capitalist economy, more recently others have explored these limitations in terms of the inherent contradictions in the notion of national sovereignty that was elaborated by the major international actors following World War II. The most significant of these recent works is Robert Jackson's (1991) book, *Quasi-States: Sovereignty, International Relations, and the Third World*. Following on Jackson, but breaking with him in terms both of his analysis and his methodology (or perhaps more accurately, his epistemology), Siba N'Zatioula Grovogui undertakes in this book to study the role of international law in the "shortcomings" and "disappointing outcomes" of decolonization in Africa. (pp. 1-2)

The author's point of departure is the premise that there are "connections between historical philosophical systems and the structures of the international order" (p. x). As a result, his approach is based on the analysis of "the structures of the discourses of both international law and politics" (p. 2). In successive historical chapters Grovogui explores the

evolution of the major international legal regimes: the justifications for imperialism and the colonial order; the post-World War I League of Nations mandate system; the United Nations' trusteeship system, and the logic of decolonization. In each of these he explores first the "discursive structures," which characterize the period, and then discusses the effect of this discourse on Africa, and most particularly on the case of Namibia, the former South-West Africa. The account of the legal discussion surrounding the elaboration of these regimes is often interesting; one might note in particular his discussion of the 1884-85 Berlin Conference's understanding of natives "right to dispose of themselves," meaning primarily the right to give up their sovereignty.

It is, however, not always clear—at least to this reviewer—what in fact is meant by certain supposed elements of that discourse. Take, for example, the argument that the "requirements of the dominant Western political economies" have been "legitimized by systems of thought and operation that have anchored the discourses of international law and relations in the Western ego" (p. 3). Or even more opaquely: "[The] fixation on the self and on self-interest can be an obstrusive [sic] self-love (*amour propre*) or an abstruse yet recognizable self-love (*amour de soi*). In the narcissistic moment between the Middle Ages and the Reformation, Christian theologians and other theorists posited the European ego as the sole locus of intercommunal relations" (p. 24).

In addition, the Namibia case itself is unfortunately not always as well presented as it might be. The crucial steps in the moves toward independence from 1978 to 1989, for example, are dealt with in one paragraph (p. 168), leaving the impression that one is not getting the full story. This may be in part because the case does not appear to fully support the argument. After insisting that the Western powers mediating Namibia's independence refused to acknowledge the supremacy of SWAPO (South-West Africa People's Organization) in the independence struggle because it did not serve their interests, the awkward fact that SWAPO emerged as the major force at independence is dealt with by the claim that it only did so by selling out its principles to the West. Indeed, in what sense Namibia's rather recent decolonization can already be said to be "disappointing" is not made clear.

These difficulties would seem to be rooted in a fundamental ambiguity in the argument of the book. The focus on the discursive and philosophical origins of international law suggests a reading of world history, and in particular of imperialism, in which major trends are driven by ideas rather than interests. This is emphasized in the detailed examination of the alleged Western mentality and the conception of "the other" which it entails. This argument is problematic, however, for two reasons. First, the attempt to find the ideas driving major and complex historical processes leads to an unfortunate but pervasive tendency to caricature those ideas. Note, for example, his list of four "authoritative claims and propositions" that he says dominate Western discourse on Africa: (1) "an emotive Western claim to postcolonial redemption and moral rectitude"; (2) "that African and other Third World crises are *solely* the result of inadequate domestic leadership"; (3) "that Western models ultimately offer the *only* reasonable alternative to the current state of international affairs"; and (4) "that Western philosophy, science, and culture remain the *sole* guarantors of international stability and prosperity" (p. 180, emphasis added).

More significantly, as international relations theorists have often noted, a consideration of the behavior of international actors would most frequently suggest the predominance of interests in explaining their actions, with the discourse of

ideas serving primarily as justification for the pursuit of those interests. Indeed, Grovogui's own account of events consistently supports such a reading, insisting as he does on how the West's encounter with Africa has been driven mainly by the effort to ensure its continued economic hegemony.

There is no doubt that centuries of Africa's relations with the international system have not been kind to Africa or Africans, and that much suffering has been the result. This is no less true in the postcolonial period, and the meaning, extent, and effect of the transfer of legal sovereignty to African governments is an important and timely topic of research. Moreover, it makes intuitive sense that, as Grovogui points out throughout this book, the fact that decolonization took place within the framework and rules of international conduct elaborated by the colonizing powers has had a significant and negative effect on the former colonial entities now recognized as independent juridical entities. Scholars hoping to understand the dynamics by which this has occurred might usefully be directed to Robert Jackson's work cited above. Grovogui's book, by contrast, might best be read as an impassioned essay calling for a recognition of the injustices of what he characterizes throughout as a "morally deficient" world order (p. 43). This book ultimately does a better job of decrying those injustices than of explaining how this state of affairs came to be.

The Future's Back: Nuclear Rivalry, Deterrence Theory, and Crisis Stability after the Cold War. By Frank P. Harvey. Montreal and Buffalo: McGill-Queen's University Press, 1997. 193p. \$55.00 cloth, \$22.95 paper.

Walter W. Hill, *St. Mary's College of Maryland*

The immediate reaction of many analysts to the collapse of the Soviet Union in 1991 was that the international system was entering a new era. In this new world order, the lessons gleaned since the end of World War II would become irrelevant. Harvey presents the provocative counterargument. He says that the end of the Cold War is likely to renew and exacerbate questions of nuclear proliferation and deterrence. Our understanding of various types of nuclear deterrence, as was developed in the last forty or so years, is likely to retain its applicability in the current era. Harvey reviews deterrence theory as it appeared and was developed in the Cold War and proposes a more extended form of analysis from that tradition. Despite claims that the collapse of the Soviet Union resulted in a new international system, he argues that events in the future will be partially understood by looking back at the use of deterrence during the Cold War.

The work proceeds by identifying relevant crises within the Cold War and analyzing these cases. Harvey is quite sensitive to the rules employed in the selection of cases. Although he believes that several fine reviews have generated a suitable list (p. 19), there is no consensus on what cases should be included. The lists of different authors do not match. He thinks that continuing to debate methods and case listings has become counterproductive. This position is understandable but probably not consistent with a positivist research program. He critiques critical questions involving coding rules.

One interesting problem is that deterrence may be extremely effective in many unobserved cases. Consider the instance in which the provoking country is deterred from even making the initial threat (p. 136). In a game theoretic sense, the nonequilibrium path is never seen, even though it constitutes the deterred threat. Such a case will not appear in any list, even though deterrence was clearly effective.

Even with a given case, coding presents further problems.

The author lists (p. 49) 28 superpower rivalry crises from 1948 to 1988 and identifies the provoking country as the first superpower to become involved in the crisis. To my amusement, with these rules, the Korean War is seen as provoked by the United States in June 1950. Yet other rules present different anomalies.

Other problems exist when deciding whether a situation belongs as a case. For example, it is difficult to determine the short-range objective of a potential aggressor, particularly in the absence of an attack. To my mind Harvey persuasively argues that clarity need not come even with full access to diplomatic records. Given that uncertainty, it is difficult to evaluate the effectiveness of a given strategy. This is true in cases of general deterrence or immediate deterrence. He examines some cases, such as the 1956 Hungarian crisis and the 1962 Cuban missile crisis to clarify this point.

As should be expected in a book dealing with deterrence, several sections are informed by work in game theory. The writing is such that the technical aspects of the analysis can be easily understood by the general reader. In chapter 4, Harvey reviews various game theoretic strategies as applied to cases. As is typical in the deterrence literature, the games of chicken and prisoners' dilemma are commonly discussed. He favorably cites authors (p. 67) who argue that the traditional structure of the two-by-two game is too simple because perceptions, which are not easily coded in the payoff structure, were critical in the superpower rivalry. For example, credibility of a specific threat in a game might be evaluated outside the game. He reviews and uses material on iterative games, and this interesting reformulation is used in a later chapter. Recent material from complexity theory is not used and could perhaps be fruitfully applied to deterrence theory. The applications might be of particular interest in light of the author's concern with nuclear proliferation in the multiactor post-Cold War world.

In chapter 6 there is a discussion of horizontal nuclear proliferation. Harvey cites the pessimist's argument as compelling, that other states are likely to obtain nuclear weapons, and he notes the weapons program of a number of countries, including Iraq and North Korea, as well as the motivation of poorly paid Russian scientists to spread arms. My sense is that one can find alarms of nuclear proliferation going back at least to the Kennedy administration, and so I have the sense of rereading "the boy who cried wolf" in this section. Of course, the wolf may eventually come, and if weapons extensively proliferate, then decision makers have to worry about the use of the weapons. Toward the end of the chapter (p. 120) Harvey notes that "other factors further undermine the assumption that reduced direct confrontation between the superpowers will necessarily result in harmonious relations at a more general level." He cites Western indifference to post-Cold War international disputes and claims that this myopic viewpoint could be disastrous in the long run.

An alternative proposal for analyzing crises appears in the final chapter. The method begins with a game-theory perspective. Harvey treats what most authors view as a single crisis as a sequence of events in a protracted crisis. He examines events in the former Yugoslavia from April 1993 to September 1995 as a series of encounters rather than a single exchange. He tests to see if there was compliance or deterrence failure at each exchange. He finds this view of the crisis more compelling than a single round of a game. In the final section there is a concise critique, from a realist perspective, of several postmodern schools. Given the continuing debate on the relevance of realism, the interesting ideas in this short subsection could have been extended.

What If They Gave a Crisis and Nobody Came?: Interpreting International Crises. By Ron Hirschbein. Westport, CT: Praeger, 1997. 223p. \$59.95.

Michael J. Shapiro, *University of Hawaii*

According to Ron Hirschbein, most of those seeking to make sense of "international reality" have yet to hear the good news about interpretive theory. In *What If They Gave a Crisis and Nobody Came*, Hirschbein both brings that news and shows how to make use of it. And despite backsliding into realist/empiricist language from time to time, he has been edified enough by his news to recognize that "international reality" is a product of interpretive imposition. Hirschbein's treatment also contains a lot of old news—for example, elaborate exegeses of various contemporary approaches to crisis decision making—to which he applies critiques based on his notions of what constitutes both interpretive and explanatory adequacy.

Happily, unlike the bulk of practitioners in the international relations field, Hirschbein is a post-Kantian. In a refreshingly lively set of discussions and analyses, he portrays crises as "meaning-making projects" (p. 16). This perspective, amplified with extended discussions of interpretive practices in various social science disciplines and with applications to Kennedy's and Nixon's Cuban crises, turns the reader's attention away from a world of unmediated facticity and toward the constructive imaginations of subjects. Kantian epistemology impugned approaches to meaning that relied on a world of things in themselves, and Hirschbein shows that the condition of possibility for the emergence of "international crises" is not the world of raw matter but the interpretive culture of subject/actors who make decisions.

The interpretive culture of Hirschbein's subject/actors articulates itself through metaphors and narratives. These symbolic equivalences and storylines combine to invent what are perceived as urgent situations. Enduring action stories (among others) reach out from the past and continue to impose meanings for those who must respond to the exigencies of the present. In developing this perspective, Hirschbein acknowledges an impressive variety of thinkers—philosophers and practitioners of interpretation, theorists of international decision making, cultural anthropologists, biographers, and media analysts, among others. His book is an ambitious, comprehensive, and focused attempt to improve our understanding of crisis decision making, as it is understood by those who function within a state-oriented, geopolitical imaginary.

I add that last phrase because Hirschbein's project—an attempt to introduce a thoroughgoing hermeneutic mentality into a field dominated by a empiricist-realist perspective—fails on one of the most crucial dimensions of critical hermeneutics; it is not self-reflective about the predicates of the world it imposes. Hirschbein supplies no critical thinking about the practices of space (the geopolitical imaginaries) within which his "crises" emerge; he uncritically adopts the locus of enunciation of state officials as his own. This most serious shortcoming of *What If They Gave a Crisis* is previewed when Hirschbein evokes and then dismisses (a caricature of) a postmodernist perspective because, he says, he does not want to succumb to "the joys of postmodern sects by abandoning the search for meaning" (p. 48).

Apart from the way Hirschbein's remark effectively abandons his own position—that meaning is imposed not found—had he heeded postmodernist insights, he would have found perspectives that challenge his approach to subject/actors. While he succumbs to the joys of abandoning fixed objects

and situations, he joylessly locks his subject into a spatially fixed and psychologized mentality. Despite his reference to the "symbolic turn in international relations" (p. 6), his subject is psychologically rather than discursively constructed. Moreover, his only subjects are U.S. public officials, whose intelligible world is a function of the reigning system of state sovereignties.

A critical approach to "crises" would raise issues about the discourses—the dominant structures of intelligibility—within which decision makers constitute the world of danger. Hirschbein's approach to hermeneutics strengthens the hold of those structures of intelligibility rather than analyzing and questioning them. In addition, granting that Hirschbein's project is to provide a better account of the *terra cognita* he shares with state officials rather than allowing other worlds to presence, his analyses fail even on their own terms. While he evokes the concept of an interpretive culture, his case studies rely primarily on psychobiographical insights into the mentalities of individuals. And while, at a discursive level, he privileges interpretation over explanation, he frequently lapses into empiricist commitments to unbiased explanations (even misreading the Gadamerian idea of prejudice as bias) (p. 97).

Nevertheless, despite its shortcomings, the good news about interpretation in *What If They Gave a Crisis* has redemptive qualities. Hirschbein's text frequently knows more than what it argues. In his construction of crisis decision making as a "meaning-making project" (p. 16), Hirschbein shows himself to be attuned to the limits of a reliance on mentality or structures of apprehension and the "contradictory dimensions of subjectivity" (p. 71). Were he to pursue the implications of a conceptually enriched notion of projects, he would be showing how the worlds of danger emerge not simply because of how people think within their decision-making cultures but because of how those cultures are constituted as a set of involvements or practices with considerable historical depth.

Hirschbein's promising notion of the project, along with some of his other insights into the ways in which the organization of decision-making cultures involves more than mere cognitive styles, should encourage more investigations into aspects of the habitus within which danger emerges. And his attention to the narrative dimension of state actors' projects, which situate danger in an unstable mythos rather than a fixed logos, should encourage an attention to various other narratives. A recognition of other narratives, for example, those of indigenous peoples and other cultures within states who fail to achieve a presence in the discourses articulating state actors' meaning-making projects, would reveal a world of danger for various peoples victimized by the frames of meaning surrounding crisis decision making.

Anarchy and Order: The Interplay of Politics and Law in International Relations. By James C. Hsiung. Boulder, CO: Lynne Rienner, 1997. 245p. \$55.00.

Stephen A. Kocs, *College of the Holy Cross*

There is a wide gap in international politics between states' everyday foreign policy concerns, which revolve to a large extent around the negotiation and implementation of international legal agreements, and the theoretical analysis of international structure, which (at least in the United States) tends to treat international law as though it were irrelevant or nonexistent. Although James C. Hsiung is not the first person to take note of this gap, his book is one of the few to attempt

to bridge it. Hsiung's main target is neorealism, which he castigates for failing to recognize the role of international legal constraints in ordering and regulating relations among states. His avowed goal, however, is not to refute neorealism but to improve and revitalize it by incorporating international law into its explanatory matrix.

Legal order, Hsiung argues, is a necessary—even inevitable—derivative of an anarchic international realm. As sovereign entities, states confront the uncomfortable fact of coexistence with sovereign others. Lacking direct control over other states' actions, they crave legal rules that will impart a degree of order, predictability, and security to their external environment. The emergence of international law is thus dictated by states' self-interest. In the international realm, according to Hsiung, anarchy and legal order are not mutually exclusive; they are complementary and mutually reinforcing. Hsiung repeatedly criticizes neorealism's "fixation" on power to the exclusion of other important factors in international politics such as institutions and legal values (pp. 21, 33, 54). He agrees with Kenneth Waltz and other neorealists on the importance of power and self-help in ensuring states' survival under anarchy, but disagrees with neorealism's tendency to define self-help exclusively in terms of coercive acts and capabilities. States' willingness to accept reciprocal legal constraints on their freedom of action, he argues, is itself a form of rational self-help under anarchy (pp. 9, 183). In the end, the distribution of power matters in determining the fates of individual states, but international legal order plays an equally important role.

Hsiung's most interesting theoretical arguments are found in chapter 2, which treats the relationship between international law and the security dilemma. In neorealist theory, the security dilemma leads directly to the problem of relative gains: Neorealists expect states to have difficulty cooperating under anarchy because of the risk that an unequal distribution of gains from cooperation will lead to a loss of relative capability. But in practice, cooperation involves more than just questions of relative gain. It also involves agreement on a set of "rules of the game" under which cooperative exchange will take place. To thrive under anarchy, states require predictability and transparency in other states' behavior. Securing such transparency is highly valuable to states irrespective of other considerations. Thus, as Hsiung demonstrates, negotiating the legal rules governing cooperation often takes precedence over questions of the distribution of resulting gains. And since transparency has strongly positive-sum characteristics (in contrast to the zero-sum character of relative gains), a focus on rules rather than outcomes enables states to circumvent substantially the relative-gains problem. Neorealism, whose monofactor emphasis on the distribution of power causes it to overlook the value of predictability and transparency in an anarchic environment, fundamentally misapprehends the structural dynamics of cooperation among states in the real world.

In subsequent chapters, Hsiung analyzes the ways in which international legal norms constrain and regulate state behavior in such areas as human rights, decolonization, environmental protection, the resort to force, and the exercise of sovereign jurisdiction. While these chapters do not break much new ground theoretically or empirically, they do perform two quite useful services. First, they provide a concise overview of the substance of contemporary international law in terminology accessible to the general reader. Second, they describe the functioning of international law from a political rather than legalistic standpoint. Hsiung has succeeded in his

attempt to produce a book on international law with which political scientists can be comfortable.

In his concluding assessment of Waltzian neorealism, Hsiung is remarkably forgiving. He praises neorealism's "structural emphasis and logic based on the anarchic premise," which, he believes, provide the theory with "the potential of self-renewal" (p. 215). He acknowledges that neorealism in its current form, which ignores the importance of legal norms in structuring international relations, "does not hold up to the real world at large" (p. 178). As Hsiung sees it, however, the solution is simple. Neorealism should treat power and law as equal and complementary pillars of international structure. Doing so would remedy neorealism's most glaring deficiency and broaden the theory so that it could account for international reality as it is actually experienced by states.

In my view, it is doubtful whether neorealism can be renovated along the lines Hsiung proposes. International relations theorists today fall into two quite distinct groups. One group, which includes the neorealists, consists of those who regard anarchy as the decisive causal force in international politics. For these theorists, the dictates of anarchy are inescapable and ultimately absolute, defining the very terms of states' existence or extinction. In the other group are those who view anarchy as a secondary factor in international life—one whose implications can be shaped and limited by self-interested states through a combination of concrete bargains and diffuse legal and normative constraints. Hsiung seems to be proposing a modified version of neorealism that would straddle these positions; but given the contradictory nature of the two camps' initial premises, it is far from clear that they can be reconciled in a single theoretical framework. Either anarchy is the decisive structural constraint in international politics, or it is not. If it is, then neorealists are right to view international legal agreements as ultimately irrelevant, and it is difficult to see how neorealism would gain additional explanatory leverage by adopting Hsiung's suggested revisions. But what if anarchy does not in itself determine the character of international structure? In that case it would seem that the neorealist paradigm collapses, leaving nothing to salvage. In contrast to traditional realism, neorealism is not a thickly descriptive and historically informed interpretation of international politics, in which selected explanatory variables can be emphasized or deemphasized while leaving the overall analytical perspective intact. It is instead a spare, deduction-based model whose predictions all proceed directly from its *a priori* premise that the consequences of anarchy are immutable and decisive. For neorealists to hedge on this assumption would amount to abandoning the paradigm altogether.

The Clash of Civilizations and the Remaking of World Order. By Samuel P. Huntington. New York: Simon and Schuster, 1996. 368p. \$25.00.

Richard Rosecrance, *University of California, Los Angeles*

Samuel Huntington has made many important contributions to the fields of international relations and comparative politics. He has called to our attention the distinction between quantitative and qualitative arms races, advanced our understanding of modernization and institutionalization processes in the Third World, and contributed to our knowledge of "transnationalism in world politics" and of the effect of democratization. One important measure of creativity in the field is the number of new and important variables a scholar

introduces. Huntington's previous work leaps this hurdle with room to spare. *The Clash of Civilizations* dramatically continues this process, uniting both comparative and international analyses in a forcefully argued analytic tract. Though admittedly not a work of social science, Huntington's new essay offers powerful food for thought for scholars, governments, and revolutionaries: Will differences between "civilizations" agitate world politics? What can be done to reduce conflict and allow Western civilization to survive?

Huntington's broad subject follows in the path of Arnold J. Toynbee and Karl W. Deutsch, who understood that religious, linguistic, and ethnic differences could evoke and even determine social conflict, domestically and internationally. Toynbee observed the response of civilizations to challenge and graded their performances accordingly. Deutsch knew that as latent ethnic populations were mobilized to political activity, the very definition of the nation could undergo change. Toynbee observed that Sumerian, Egyptian, and Classical civilizations ultimately failed to respond to multi-form challenges. In like manner, Deutsch witnessed the transformation of nation-states from one nationality to another. To take but one of his examples, Finland was initially dominated by its mobilized Swedish population, then ruled by Russians. The latent Finnish population became fully politically participant only in the twentieth century.

Unlike Toynbee and Deutsch, however, Huntington offers a theoretical approach to what has happened since the end of the Cold War and what will happen in the future. The division of the world into two blocs, which prevailed during the Cold War, no longer exists. But Huntington does not believe that the world has thereby degenerated into a realist anarchic system of nation-states in which the only protection is nuclear deterrence. The "one-world" theory of politics and economics, he thinks, is also false. The processes of "globalization" ultimately lead to cultural rejection and self-assertion. Instead, Huntington believes major fault lines are being drawn between civilizations: Orthodox vs. Western Christian; Orthodox vs. Moslem; Moslem vs. Hindu; Sinic vs. Hindu; Moslem vs. Western Christian. Sub-Saharan Africa and Latin America remain on the sidelines of these oppositions. There is a link between Sinic and Moslem civilizations which may grow in strength. Western Christian civilization is becoming marginalized. Not only that, it may be weakening in face of the challenge of other cultures. Increasingly, Huntington believes, fault lines between civilizations breed wars, particularly between Muslims and non-Muslims. He contends: "Fault line wars are intermittent; fault line conflicts are interminable" (p. 291). Such conflicts can be briefly interrupted by papal intercession, the intervention of the World Council of Churches, the OSCE, or by Dayton-style accords. But such mediations will not endure.

Huntington distinguishes between civilizations that have major core states (or in which the civilization is a state) and civilizations which have no cores. Sinic civilization has the core of China. Japan has its own civilization. Western civilization has linked cores in the United States, France-Germany, and the United Kingdom. Russia is the core state of Orthodox Christianity. Unlike these cultures, Islam has no core states, only feuding rivals for influence.

Yet, Islam represents, he believes, the future challenge to the West. Its birthrate is higher than that of other civilizations, and Huntington contends that the "Islamic Resurgence" is as historically significant a phenomenon as the European Renaissance, the Reformation, and the Industrial Revolution. The United States and Western Europe are involved in a "quasi-war" with Islam, and not just with Islamic Fundamentalists. Moslems of all political and religious col-

orations reject Western civilization and American influence. Even though direct conventional war only occurs from time to time, Islamic terrorism carries weapons into the citadels of Western power. Thus, the vital reference point for the future is the hostility between Islam and the West.

Huntington also forecasts the emergence of an alliance between China and Islamic nations. China will sooner or later assert its dominance of East Asia. If the United States resists this pressure, Beijing will seek support from Islam. Indeed, it is already doing so. The outcome of the conflict between the West and the United States on the one side and China and Islam on the other therefore depends upon the policy of "swing states"—Japan, Russia, and India. Japan will probably "bandwagon" with China unless the United States adopts an extremely strong line and builds up its military presence in East Asia. Russia will not adopt a pro-Chinese position. A long-term rapprochement between India and China, the world's two most populous nations, is impossible. In one Huntington scenario, "the United States, Europe, Russia and India . . . become engaged in a truly global struggle against China, Japan, and most of Islam" (p. 315). That conflict occurs because one core state intervened in conflicts within another civilization. To avoid war in the future, core states will have to keep out of each other's intra-civilizational quarrels. Will Great Powers heed such limitations? Huntington is pessimistic. As a result, conflict will likely increase between civilizations.

How plausible is such a world? How dominant are the civilizational forces which Huntington describes? As many critics like Edward Said and Bernard Lewis have argued, cultural differences cannot simply be ignored. However, Huntington's synthesis neglects three key points. The first is microanalytic in character. Civilizations have a tendency to break up into contending factions. Subunits emerge which dilute the integrity of the whole. Christianity was riven by the struggle between Protestant and Catholic camps and remains divided today. Buddhism scarcely remains a unified religious movement. In Islam, Sunni and Shi'ite wings vie for influence. There are in fact as many conflicts within cultures and civilizations as exist between them. Indeed, from Huntington's point of view, the Cold War was a struggle between two wings of an essentially Western and Christian civilization. Huntington admits that "the conflicts within Islam were also more numerous than those in any other civilization" (p. 257) about 42% of the total in 1993. When the prominent Arabist, Malcolm Kerr, wrote *The Arab Cold War* in 1965, he observed that rivalries among Islamic nations were just as characteristic as their common hostility toward Israel. Nothing which has occurred since alters this judgment. Taiwan and China, North and South Korea, Afghanistan, and Tajikistan exist within the same civilization yet have signal differences.

And one might ask, if civilization is the true independent variable, why did it give way to power relationships during the Cold War? If civilizations bowed before military power then, aren't they likely to be reshaped by analogous forces now? In the final scenarios of the book Huntington aligns a powerful China with Islam to oppose Western nations. Japan bandwagons in favor of Beijing, leaving India and Russia to join the West. These alignments explicitly cross civilizational boundaries and reflect the interests of powerful states, not overarching cultures. One might then be tempted to conclude that military power and bipolarity can dwarf the influence of cultural determinants.

But state power is not the only relevant factor. Today the "clash of civilizations" is overshadowed even more by global economic power (which is both more seductive and harder to resist) than military strength. Judged by their recent behav-

ior; both China and Iran do not appear to overlook the economic benefits of a closer relationship with Western countries. Thus, macroanalytic forces provide a second basis of criticism. If divisive forces within civilizations are still powerful, so are forces that unite them, militarily and economically. In East Asia, the members of ASEAN are Buddhist, Christian, and Moslem. They include Vietnamese and Thai cultures that are distinct from China's, APEC brings into this group Western nations, China, and Japan. The economic benefits of association appear to transcend civilizational limitations. OECD includes several cultures; G-8 and IMF still more.

In fact, the influence of the world economy is the one variable essentially excluded from Huntington's analysis. Some claim that economic interdependence among states was never higher than in 1913, but this did not prevent the outbreak of World War I. In fact this claim is largely specious. Though foreign investment then was a larger proportion of GDP than it is today, it was overwhelmingly liquid portfolio investment which could be quickly disposed of in a crisis. To the extent that direct investment in physical facilities was involved, it was largely confined to a metropolitan power's empire. European Great Powers did not have a significant stake in the economies of brother nations. This has dynamically changed today. In fact, most developed countries are decentralizing their manufacturing production to other nations and to each other. Most new German production, for example, will be lodged outside of Germany, in the United States, China, Eastern Europe, or East Asia. The United States and Japan are also sending much of their production overseas, with Japanese production dynamically increasing in the American economy, while U.S. production goes to Europe and Latin America as well as China. Largely excluded from this productive relationship is the contemporary Middle East. In that region, most Islamic nations continue to discharge their futile energies in regional rivalries and wasteful military spending, undermining their prospects of economic growth. Culturally, there may be an Islamic Resurgence, but there is no economic or military Islamic challenger to Western leadership and none is likely to arise.

Finally, Huntington's analysis contains methodological problems. Independent variables have to be correlated with dependent outcomes. Civilizational differences have not generally been correlated with the outbreak of strife, either domestically or internationally. If this had been true, multinational or multilingual states could not exist. There are more than 8,000 separate cultural dialects spoken in the world today. If the cultural groups which each of these represent were to become a nation-state, the present world of 200 countries would be smashed to smithereens. In fact, most present states easily transcend or confine cultural conflicts within their borders.

Equally, if civilizational difference is not correlated with conflict, neither is war the product of such differences. The enormous numbers of wars within a single civilization (look at Western European history) makes it clear that the equation does not work whether one starts from the dependent or from the independent variable. And important power and economic dimensions are entirely left out of the equation, even though they centrally bear on issues of war and peace.

This does not mean that Huntington's warning is not a useful corrective to "end of history" optimism that has characterized some recent thought. The rise and decline of civilizations sometimes lead to disturbances which cause conflict. It appears that Chinese though not Islamic civilization is rising. Huntington is right to suggest that Western

states will have to find means of accommodating it within a more pluralistic society of nations.

Gatekeepers of Growth: The International Political Economy of Central Banking in Developing Countries. By Sylvia Maxfield. Princeton, NJ: Princeton University Press, 1997. 192p. \$35.00.

Sofia A. Pérez, *Boston University*

The role of central banks in the political economy has been a subject of theoretical debate and empirical investigation by political scientists for some time now. Taking normative work by economists as its basis, most work by political scientists on the subject has focused on the effects of central bank status (i.e., whether the central bank is subordinated to executive authorities or enjoys some form of statutory autonomy or operative independence in setting monetary policy) on various measures of economic performance (inflation, growth, public deficits, and employment) or on the incidence of electoral business cycles. In recent years, there has also been a growing literature on the political determinants of central bank status, or as it is commonly referred to, central bank independence (CBI). Most work on the causes and consequences of CBI by political scientists, however, has been based on assumptions that fit the political and institutional context of advanced industrialized democracies. *Gatekeepers of Growth*, by Sylvia Maxfield, addresses what thus remains an important void in this literature. It develops a general argument about the determinants of central bank independence in middle-income developing countries.

Maxfield begins by pointing out that most explanations of why governments delegate authority to central banks focus on internal political causes while neglecting external sources. This closed-economy approach, she suggests, is particularly inadequate when it comes to understanding why governments opt in favor of CBI in developing countries. Maxfield acknowledges that some of the domestic variables highlighted in the literature on CBI in advanced industrialized countries (the time horizons of governments and the degree of political competition) may also be relevant in explaining variation in central bank status in developing countries, while dismissing others (wage bargaining institutions, leadership, and ideology). The single most important factor that is overlooked in closed economy models, she argues, however, is the need for international credit and investment faced by developing country governments. She proposes an "investor signaling" model of CBI according to which governments cede authority to central banks in order to signal their country's creditworthiness to international investors. The principal empirical implication of this model is that "actual central bank independence in middle-income developing countries [should vary] with a country's need for credit and investment, as perceived by government politicians" (p. 35).

The book is devoted to supporting this hypothesis through a combination of quantitative data and case study material. Maxfield draws a connection between recent moves toward greater central bank autonomy in Latin America, Eastern and Western Europe, and Asia and the rise in international portfolio finance over the last decade. She also looks at the relationship between CBI and need for international creditworthiness (as measured by foreign reserve coverage of import requirements) over time in four case study chapters on Thailand, Mexico, South Korea, and Brazil. In addition, she seeks to test her signaling hypothesis indirectly by regressing private investment in middle-income developing

countries against a set of variables that includes an index of central bank independence. This eclectic methodological approach allows Maxfield to present a more contextualized account of the subject than is offered in the quantitative literature on CBI, much of which has failed to produce consistent results. It also allows her to move the discussion beyond the problem of finding a valid, quantifiable indicator of CBI, one of the principal points of contention in the literature.

Maxfield is up against considerable data limitations in the regression analysis. She is not able to test her hypothesis directly due to the lack of temporal variation in measures of *de jure* central bank independence. However, she is able to draw a compelling connection between the changing external position of developing countries and changes in the role that central banks play in economic policy in the case study chapters. Indeed, the case study material represents the principal strength of the book. But it also raises some important conceptual issues. Maxfield chooses to measure central bank autonomy not in terms of legal or statutory features, but in terms of a qualitative evaluation of whether economic policy conforms to the preferences of central bankers. She offers a persuasive justification for this choice: There are important changes in the role that central banks are afforded over time that are not reflected in legal statutes. Yet, if such nonformalized central bank authority is a function of a government's need for external creditworthiness (as Maxfield argues) and can be withdrawn as easily as it is granted (as the case studies seem to suggest), then does it represent anything more than a change in government policy preferences? Maxfield does offer one measure of central bank authority that is independent of policy outcomes (governor turnover). But again, as her discussion of Mexico reveals, governor turnover is high when a government's need for creditworthiness is low. It declines when a government's need for creditworthiness rises. Is this central bank autonomy or a convergence in the preferences of governments and central bankers?

The problem is hardly unique to Maxfield's analysis. It is a conceptual ambiguity inherent in any institutional arrangement that involves a delegation of authority. Indeed, Maxfield seems to spell out that ambiguity in arguing that governments grant authority to central banks in order to signal "their" creditworthiness. But why should such a commitment be credible or effective in influencing investors. The answer, the literature suggests, seems to lie in the manner in which formal central bank autonomy alters the rules of the domestic political economy. Thus, while Maxfield persuasively establishes a connection in time between changing external constraints and central bank authority in developing countries, a real understanding of the dynamic here at play requires a more developed model of the domestic politics of economic policy in these countries.

In spite of these conceptual issues, *Gatekeepers of Growth* represents an important contribution to the literature on central banks, and beyond it, on the politics of economic adjustment in developing countries. It establishes a link between changes in the financial needs of developing countries and domestic institutional developments and thereby provides a framework for future research. One of the tasks of this future research will be to explain how central bank independence alters the political dynamics of economic policy in middle-income developing countries, and how this in turn may help us understand the choices that governments in these countries make in response to international financial pressures.

Crucible of Beliefs: Learning, Alliances, and World Wars. By Dan Reiter. Ithaca, NY: Cornell University Press, 1996. 232p. \$35.00.

Patricia A. Weitsman, *Ohio University*

It is often said that military strategists are constantly preparing to fight the last war. They draw on lessons of the past, while neglecting key technological innovations. This leads to critical errors in the prosecution of war. In a similar vein, Dan Reiter develops a theory of learning that facilitates our understanding of how and why small states make the alliance choices they do. In *Crucible of Beliefs*, learning theory is developed and tested against balance-of-threat theory to determine which is the better predictor of small state alliance choices. In the quantitative section of the work, Reiter finds strong support for both of the key learning hypotheses, although especially for the individual learning proposition. Small states will learn from alliance successes and failures—they will maintain a course of action (alliance or neutrality) if they experience success or will change their course (alliance or neutrality) if they experience failure. In contrast, the balance-of-threat propositions do not fare nearly so well (pp. 71–2, 92–6).

The subsequent two chapters explore in greater detail a number of the cases. Chapter 6 analyzes two "clusters" of similar cases, Belgium/Netherlands/Switzerland and Sweden/Norway, that supported the individual learning proposition; chapter 7 closely examines the 16 cases (out of 127) that were not supported by the individual learning hypothesis. The combining of rich qualitative detail to supplement the quantitative findings is an important strength of the work. Reiter supplements learning theory by developing parameters within which learning will translate into policy. He argues that a state's political system will have an important effect on whether or not it acts on the lessons learned from formative events. He proposes and finds empirical support for the argument that democracies will be more apt to heed the lessons of history than will nondemocracies within the foreign policy domain of alliance behavior (pp. 183–9, 195–202).

In all, *Crucible of Beliefs* is a provocative, well-crafted, insightful, and informative work. Reiter is meticulous in developing and testing his theory; he is attentive to potential problems that would inhibit his findings. Furthermore, the prose is crisp and clear, chock full of illustrative anecdotes and examples. An additional strength of the work is its focus on small states—the most numerous members of the international system, yet the least studied. There are, however, a few questions that remain unanswered by the book.

A first issue is the unit of analysis. Reiter's analysis of learning suggests that it is the state that learns lessons from formative experiences. This necessarily begs the question of what happens when decision makers within a state learn divergent lessons from a formative event. Since Reiter borrows from social psychology studies and decision-making theory—theories that facilitate our understanding of the minds and thought processes of individuals—it seems there should be some mechanism through which we better understand how those processes are aggregated. It is not satisfying to equate learning with outcomes; the first is a process, the second, an action.

In addition, learning theory is only applicable to states whose goals do not fundamentally change. Lessons are heeded by status quo but not by revisionist states. For instance, in the brief discussion of the great powers and the applicability of the framework to these states in chapter 5, Reiter examines Germany. He writes that instead of learning how to avert war from the World War I experience,

Hitler accepted war as an important means to attain his objectives; and instead of learning the dangers of alliances, the lesson drawn would be only the importance of autonomy (pp. 114–5). This reveals the ambiguity surrounding the kinds of lessons that can be learned from any one experience. Reiter also writes that the central objectives of Hitler were so different from the largely defensive aims of the postwar Germanies that the “German leaders would be unlikely to draw on lessons from the Nazi experience to guide decisions on alliances” (p. 114). Preferences appear to be exogenous to the theory—learning theory is not really a theory of preference formation as Reiter suggests. The difficulties associated with aggregating the learning process are also clear.

Finally, a formative event is a “small set of high impact, vivid events that spur the drawing of new lessons” (p. 35). Yet, how can we know, *ex ante*, what will be a formative event? This problem is illuminated when Reiter discusses the states that did not learn from the World War I or World War II experience. For some of these cases, “the World War experience was simply not as significant as other political factors, such as the emergence of nationalism” (pp. 181–2). This implies that we only know *post hoc* what is a formative event to any specific state.

A related point is how we know, *ex ante*, when a situation will be analogous to a formative event. Reiter examines World War I and World War II. These are, however, exceptional cases—two systemic wars in the space of 25 years. It is unlikely in the era following the nuclear revolution that conflagrations of this type will take place. How do we extend the insights of Reiter’s work into the contemporary system? What would make for analogous situations? In addition, since the focus of the book is on small states, would experiences such as wars of independence or colonial histories be formative events and more appropriate sources of analogy? Furthermore, to what extent do nonevents or crises averted—formative nonevents—affect learning? In answering these questions, Reiter’s theory may help us understand the perpetuation of the NATO alliance following the end of the Cold War: Member states may have drawn lessons concerning the utility of membership in the organization. It must be emphasized, however, that the fact that these questions arise is testimony to the strength of Reiter’s work, the many directions of research his book has revealed, and the promise of learning theory. They do not detract from the importance of his contribution.

Dan Reiter’s *Crucible of Beliefs* is an outstanding addition to the alliance literature and the literature on international relations theory in general. It is a refreshingly new and innovative advance in the field. The book is a must-read for anyone interested in alternative avenues of inquiry about state behavior that go beyond the rationalist, realist, or institutionalist explanations that have dominated the field for so long.

Winning the Peace: America and the World Order in the New Era. By John G. Ruggie. New York: Columbia University Press, a Twentieth Century Fund book, 1996. 237p. \$27.95.
War or Peace? Nationalism, Democracy, and American Foreign Policy in Post-Communist Europe. By Steven L. Burg. New York: New York University Press, a Twentieth Century Fund book, 1996. 258p. \$35.00.

Tony Smith, *Tufts University*

For the purpose of charting the course of American foreign policy after the Cold War, the Twentieth Century Fund has commissioned a series of at least a dozen books to date—

including volumes by Michael Mandelbaum, James Chace, Janet Heininger, Robert Art, Jonathan Dean, Rosemary Righter, Richard Ullman, and the author of this review—books that either reflect on the overall structure of the international system, as John Ruggie’s work does, or that deal with specific issue areas, as Steven Burg’s volume does. Under the direction of Richard Leone, the Fund’s aim is to sponsor books based on an intimate understanding of world affairs that may be of interest not only to academic audiences but also to the informed public as well as to policymakers in Washington.

John Ruggie is a political science professor at Columbia and former dean of the School of International and Public Affairs there, a man known for stressing the importance of multilateralism in American foreign policy. In *Winning the Peace: America and World Order in the New Era*, Ruggie aims to make three important points. First, multilateral cooperation in economic and security affairs has been one of the most distinctive contributions of American foreign policy to world order since 1945. While the tradition dates back to Woodrow Wilson, it was only with the creation of the Bretton Woods System in 1944, the United Nations in 1945, and the North Atlantic Treaty Organization in 1949 that multilateralism became a central component in Washington’s efforts to create an international system assuring this country’s security.

Ruggie’s second key point is that the contribution of liberal international multilateralism to America’s success during the Cold War has gone underappreciated. Realism in the Academy, and unilateralism (not so much isolationism) in the Congress and the public, have failed to give credit where it is due to the enormous benefits the United States has reaped from a world order many of whose leading institutions have been inspired by American thinking on multilateralism.

Ruggie’s final major concern is that a combination today of protectionism in economic affairs and unilateralism in security matters may lead the United States to turn its back on one of the most important set of policies that has contributed to the current Pax Americana. To counter these trends, he calls for a commitment to social welfare and job training programs at home large enough to insure a domestic consensus in support of international economic openness and for a better understanding of the enormous security advantages that the United States gains with its leadership in international organizations like the UN and NATO. If America would “win the peace” after winning the wars, then it would best sustain those practices which contributed to its current international preeminence.

While I have no quarrel at all with Ruggie’s essential argument, I find the way he makes his case wanting. The overall logic of his book is sound: that past thinking created institutions that made for present greatness in ways that should be respected in future policies. But the amount of space given to the potted history that sets up the argument for the importance of multilateralism in today’s world (surely 80% of this short volume of just 173 pages of text) is totally disproportionate to what should presumably be the work’s major focus: what multilateralism means today.

Three cheers for multilateralism, to be sure, but what does this portend for the way forward? Should NATO be expanded? Ruggie seems unsure. How might the UN better serve peacekeeping functions? Ruggie describes the problem but offers no solution. How might the World Trade Organization respond to China’s bid for membership or the International Monetary Fund more effectively monitor foreign political (and not only economic) performance? Here not a word.

Nor is even Ruggie’s potted history of U.S. support for multilateralism totally satisfying as a basic introduction. He

makes no reference to America's efforts to foster multilateralism by sponsoring democratic governments in a host of countries, certainly a key ingredient of U.S. success. Promoting liberal democratic government in Japan and Germany—with the latter making the European Union possible and contributing importantly to later efforts to democratize Eastern Europe and Latin America, while the former has perhaps had some effect on political developments in South Korea and Taiwan—has been so fundamental to the unprecedented vitality of U.S.-sponsored multilateral economic and security institutions, that it simply cannot be ignored. Surely it is far from a coincidence that multilateralism works best where democracy (and not just capitalism) is most consolidated. I have no idea how a theme of such obvious and basic importance could have been neglected given the vast literature on the subject that has appeared since the early 1990s and, if this body of work has any point at all for today's world, the presumed dependence of the future of multilateralism on the strength of democratic governments worldwide.

Ultimately, then, the book fails to deliver on its potential. The strength America has drawn to date from its involvement in international multilateralism is not fully enough presented to make as rousing a case for it as the author (and I) would like, while the lessons from the experience of the last half-century are not clearly enough drawn to inspire the enthusiasm the author (as well as I) would like to see take hold in official Washington and with the public at large for a continuation of U.S. commitment. A worthwhile inspiration to make a case for American liberal internationalism has not satisfactorily materialized as a book.

Brandeis political science professor Steven Burg's *War or Peace? Nationalism, Democracy, and American Foreign Policy in Post-Communist Europe* is like Ruggie's in its ambition to help us better make important political decisions in challenging new times. Also like Ruggie, Burg is what I like to call a "national security liberal," a person who sees the American national interest linked to promoting a particular kind of world order first outlined by Woodrow Wilson, one where democratic governments unite institutionally to promote openness in international trade and investment and cooperation for security. Both authors also agree that the realist paradigms for analysis and prescription are fundamentally flawed by their inability to take seriously a liberal agenda for world order—the promotion of democratic government abroad (Burg's principal concern) or the sponsorship of multilateral organizations for security and prosperity (Ruggie's main focus). Whereas Ruggie is interested in international organizations, however, Burg's arena of analysis is the challenge of consolidating democratic governments in Eastern Europe, especially in the former Yugoslavia, in the aftermath of the Cold War, although he explicitly endorses multilateralism as an appropriate way for the United States to proceed.

Burg's mastery of the intricacies of the problems confronting liberal American statesmanship in the task of promoting democratic government in postcommunist Europe is quite impressive, for he manages to interrelate three distinct narratives: the evolution of ethnic political forces in the countries of Eastern Europe and the Caucasus in the aftermath of the Soviet implosion; the story of Western and Russian efforts thereafter to promote stable governments in the region; and the collected wisdom of political theorists as to why we in the West should care to ease the transition from authoritarian rule to democratic government so as to avoid having this region descend into murderous anarchy unleashed by ethnic fears and hatreds manipulated by demagogic leaders.

Burg is already known as an expert on the Yugoslav crisis, but in this book he takes pains to make comparative references to analogous situations in the Baltic region, Czechoslovakia, and the Caucasus (especially Armenia and Azerbaijan)—all situations where communist rule collapsed and ethnic politics came to the fore. While events have already moved beyond the histories he recounts, Burg's analysis nonetheless can stand as useful historical case studies. The same is true of his account of international efforts to contain Balkan wars. He completed his book before the Dayton Accords, so much has transpired recently, yet the clarity of his presentation of the deliberations of international actors is such that his analytic framework has not been left behind by events.

Ultimately, then, it is Burg's argument for the importance of democracy in postcommunist Europe, and his confidence that we know enough to make at least some important contributions to bringing a stable peace to the region by promoting such governments there, that emerges as the strongest, because the most enduring, element of his book. Indeed, because the theoretical sections of his book stand so well on their own, someone interested in ethnic conflict in Africa, South Asia, or the Middle East might also well profit from this study.

The essential message of Burg's book is liberal Wilsonianism: that the United States and its allies need to promote democratic governments in postcommunist Europe if they hope to serve their concrete national interests in promoting stable governments in the region. Whereas others (especially realists) tend to assume that there is little that outsiders can do to dampen conflict in the region, and that there is little reason for us to be concerned in any case because of our minimal interests in the region, Burg points out the danger of expanding wars in the region, the challenge of refugee and other humanitarian problems, and the world order need for the United States to affirm its leadership by responding to these crises by developing new multilateral solutions for ethnic conflict in areas important to Western security. As a result, Burg argues against the conventional wisdom that force should be projected only as a last resort into ethnic conflicts of the Yugoslav kind, just as he maintains that outsiders can participate in "nation building" and "state building" schemes despite the concerns of those in the military, the Congress, or the ranks of the realists who favor clear "exit strategies" that avoid "mission creep" (to use some of the terms bandied about today) and so oppose the political and military agendas of liberal interventionists.

If the book has weaknesses, they are those of the liberal argument in general. While personally I would like strongly to endorse Burg's argument, candor requires facing its difficulties. One that Burg seems reluctant to admit is the extraordinary intractability of ethnic relations once they have become polarized. For example, despite enormous outside pressure, only now do the Troubles in Northern Ireland finally seem to be coming to an end. At the same time, the peace accord between Arabs and Israelis today seems to be unravelling, while there are mounting fears of renewed Hindu Muslim clashes in South Asia. In short, much as we may want the international community to make a difference, and compelling as the suggestions Burg makes as to what Washington and its allies might do to foster democracy abroad, how confident can we be that we have anything like the requisite influence to bring about transition to multiethnic democracies in regions like Eastern Europe, the Balkans, and the Caucasus (not to speak of Africa, South Asia, or the Middle East)?

A second limitation is that Burg seems to me to inflate the

dangers to us of our failure to be successful in the liberal enterprise. He is surely correct that it would serve Western interests were democratic regimes to become widely accepted in postcommunist Europe; we should be glad that such seems to be the case in the Czech Republic, Poland, Hungary, and Slovenia. And Burg is right to stress that the United States should promote democratic governments abroad multilaterally—in the case of Eastern Europe, in conjunction with the European Union and Russia especially. However, we must know where not to risk allied unity in pursuit of quixotic undertakings. The likelihood of escalating wars and streams of refugees he warns us against must be weighed against the real costs of the protracted military interventions he seems to envision.

In short, both the inherent difficulties of influencing local circumstances and the vagaries of multilateral cooperation dictate prudence when calling for efforts to promote multi-ethnic liberal democracies abroad. Where the means to ends are not readily available, then however desirable the ends may be, we should be cautious as to the course we take. Burg has written an excellent book, one well worth reading by those interested in the stake the United States has in democratic transitions today in many parts of the world. But he surely knows how difficult the outcomes he hopes for will be to achieve, and he might have been more candid in informing the general public and our policymakers on the problems inherent in achieving the democratic future we all wish for these troubled regions.

Sovereignty over Natural Resources: Balancing Rights and Duties. By Nico Schrijver. Cambridge, UK: Cambridge University Press, 1997. 452p. \$89.95.

Elizabeth R. DeSombre, *Colby College*

In this impeccably documented volume Nico Schrijver paints a thorough picture of the evolution of the principle of international law that he calls "permanent sovereignty over natural resources." This concept, tangentially related to broader discussions of what constitutes sovereignty or to issues of resource conservation, is in practice a legal doctrine of mostly symbolic effect. He traces the development of the idea primarily through examination of General Assembly resolutions, although he also examines its use in arbitration and in writings of legal scholars. The pinnacle of its development came in the 1962 declaration of the United Nations Commission on Permanent Sovereignty over Natural Resources, which affirmed the "rights of peoples and nations to sovereignty over their natural wealth and resources" (General Assembly Resolution 1803 [XVII]). This principle, originally intended to give developing countries the ability to control their own economic development, was expanded beginning in the 1970s to include state jurisdiction over areas of the ocean, and to ensure rights of states within broader principles of environmental protection.

The genesis of this principle can be traced to two different sources. First, newly independent developing countries (primarily in Latin America) pushed the idea of permanent sovereignty as a way to gain control over their own resources, often exploited by multinational corporations in vestiges of colonial influence. Initial struggles over the extent to which states had rights to their own resources began with the nationalization of industries, and the ensuing legal battles about whether expropriation of foreign-owned companies should be subject to domestic or international guidelines. This development also played into Cold War rivalries, as the

Eastern bloc supported the rights of these newly independent states against those of the industrialized West.

Second, the principle developed in the context of nonself-governing peoples, to refer to the situation of those under foreign domination and the idea that their territory should not be exploited for the benefit of its occupiers. Schrijver explores this development through examination of the reactions to South Africa's control over what later became Namibia, Israel's occupation of Arab territories, and U.S. control of the Panama Canal Zone. This issue developed concurrently with international human rights law and the acceptance of the idea that people have the right to self-determination. Although it is possible to see in instances of foreign occupation an effort to develop the principle, Schrijver fails to show that this principle has been applied in a meaningful way in these cases. He points to resolutions that call for the rights of peoples in foreign-controlled areas over their own resources, and UN studies of the resource costs to occupied territories, but little evidence of behavior change can be seen coming from these discussions. If present at all, this influence came indirectly. For instance, Schrijver tells of a Dutch uranium reprocessing facility that was taken to task in the UN Council for Namibia for countervailing the "rights of that people with respect to the ownership and exploitation of the natural resources of Namibia" (p. 150) because some of the uranium it reprocessed came from South African controlled Namibia. It is not clear that the finding produced a change in behavior, or that Dutch behavior in uranium reprocessing would have much of an effect on Namibian permanent sovereignty whatever the outcome.

It is at times difficult to distinguish whether the positions taken by states in the development of the idea of permanent sovereignty were due to actual concern over the validity of uses of legal principles (as they and sometimes Schrijver suggest) or to political maneuvering. It often seems that intricate legal arguments were made based simply on what various actors wanted the result of a given debate to be. But the fact that actors are playing politics with law does not prevent the legal arguments from having influence. It may be important to remember that politically expedient arguments can ultimately result in legal principles that have effects outside the issues on which they were formed.

The two main areas in which permanent sovereignty has established itself as an accepted principle are international investment law and laws pertaining to the environment and the international conservation of resources. Within investment law the acceptance of rights to nationalization and expropriation, within some parameters, are an embodiment of this principle. Most recent laws about environmental protection contain some statement about a state's sovereignty over its own resources and its ability to use them as it wishes for its own development.

Interestingly, Schrijver suggests that the emergence of this norm at the intersection of international laws both about how states conduct their economic affairs and how they address protection of the environment will allow for its use in the issue of sustainable development. Perhaps. But national control over resources seems ill-suited to provide guidance in an age of environmental problems that relate to transboundary resources or the global commons, and it does not take into account the importance of geographically fixed resources to world ecosystems. Schrijver does address the analogously developed principle of the Common Heritage of (Hu)man-kind, which also arose out of concerns of developing countries hoping for influence over resources (in the common heritage case it was of resources beyond national boundaries). Because of their similar origin he does not see these

two principles as contradictory, but if you take each to its logical conclusion they may not be compatible.

Ultimately, though, Schrijver asserts that, along with the rights that can be derived from permanent sovereignty over natural resources come obligations. These obligations include some duty to exercise these rights in a way that ensures that the population of the state benefits from the use of these resources, to have "due care for the environment" (p. 391), to recognize rights of other states to resources that are shared or that cross boundaries, and to fulfill international obligations. In part he is making an empirical claim that obligations have tended to follow the development of rights of permanent sovereignty, as a way to restore the shifting balance of influence gained by developing countries. And in part he is making a plea, that we remember that, as the Permanent Court of International Justice ruled in a 1925 case, "all rights of an international character involve international responsibility" (p. 29), and act accordingly.

Rogue Regimes: Terrorism, and Proliferation. By Raymond Tanter. New York: St. Martin's, 1997. 260p. \$29.95.

Beau Grosscup, *California State University, Chico*

Raymond Tanter's *Rogue Regimes*, using a case study approach, offers a few sound insights into how and why American policymakers view the post-Cold War context. First, he contends that they tend to personalize their enemies and demonize those they find most troubling. This has led them to identify those leaders and nations who appear to threaten the new American-led world order, label them "rogue or outlaw regimes," and attempt to contain or diminish the perceived threat. For Tanter, the tendency to demonize provokes policy whose centerpiece is the imposition of sanctions on the rogues for reasons of retribution. This contention helps us understand why and how sanctions have come to dominate the U.S. approach to perceived enemies. Second, Tanter informs us that the policy of the United States toward rogue regimes is often at odds with that of its industrial allies. This important discussion helps to sort out why European nations often oppose or give lukewarm support to U.S. calls for sanctions. It also highlights the fact that the notion of rogue regimes is fundamentally an American creation that principally serves U.S. domestic and foreign interests. Finally, in his case studies of Iraq, Iran, Syria, Cuba, and North Korea, Tanter argues for different policy options depending on the factors involved in their threat, the arena of U.S. interest served, and the status of the various regimes. This is useful because it focuses attention on the complexity of the policy context even in dealing with states and leaders lumped together under a general ideological construct (rogue regime).

Unfortunately, the book has three major shortcomings that severely limit its scholarly contribution. First, there is no critical assessment, or even recognition of such an assessment (as is provided in Michael Klare, *Rogue States and Nuclear Outlaws*, 1995), as to the political nature of the rogue regime label. Instead, Tanter operates within a highly questionable parent-child framework, in which the motives and behavior of the parent are never addressed, and accepts that the criteria by which rogues are designated are useful in separating out these states from the rest of the world. Yet, brief evaluation of the criteria suggests that many states, most notably Israel, Great Britain, France, Russia, and the United States itself, easily qualify as rogue regimes.

Second, Tanter relies wholeheartedly on the U.S. State Department definition and designation of states who sponsor

terrorism to bolster his case for the usefulness of the rogue designation. Yet, the political nature of that terrorist list is well documented (e.g., see Edward Herman and Gerry O'Sullivan, *The Terrorism Industry*, 1989; Beau Grosscup, *The New Explosion of Terrorism*, 1991; and Noam Chomsky, *World Orders Old and New*, 1994). Thus, the reader receives another partial and biased analysis of state-sponsored terrorism that now dominates the Western literature (e.g., see Cindy C. Combs, *Terrorism in the Twenty-first Century*, 1997).

Third, in the analysis of the rogue leaders, Tanter engages in psychological analysis to explain their strange behavior that is by any measure amateurish, if not wrong. In any case, it needs much more depth and documentation in order to pass muster.

The book ends with no conclusion, so there is no effort to summarize or build on the analysis, a weakness only partially overcome by rereading the Introduction.

Risk Taking and Decisionmaking: Foreign Military Intervention Decisions. By Yaacov Y. I. Vertzberger. Stanford, CA: Stanford University Press, 1998. 519p. \$69.50 cloth, \$24.95 paper.

Edward Rhodes, *Rutgers University*

As critics of rational-choice modeling have long observed, when confronted with risk and uncertainty decision makers typically do not make rational calculations and choices. The challenge facing these critics is twofold: first, to develop a general understanding of the process of decision making under risk—one that recognizes the role of affective, cognitive, social, cultural, and organizational influences in determining perceptions of and attitudes toward risk—and, second, to draw upon this understanding to develop predictive models that are sufficiently parsimonious to be useful. Yaacov Vertzberger takes up the first of these challenges in this study of military intervention. He provides a wonderfully rich, highly textured examination of how decision makers actually grapple with risk, exploring the interplay of factors which encourages different assessments of dangers, different tastes in risk-taking, different tolerances for risk, and different behavior in risky situations. This is a welcome addition to the literature, bluntly challenging the narrower, more mechanistic microeconomic conceptions of risk that have increasingly informed political science discussions.

Specifically, Vertzberger is interested in explaining decisions to undertake and persevere in major military interventions. The subject is of more than purely theoretical interest: There are dark mysteries here worthy of resolution, nightmares of ill-judged policymaking that still haunt American and Israeli leaders and scholars traumatized by the Vietnam War and the 1982 Lebanon invasion and that may again come to haunt the creators of today's new global order. First, and perhaps most important, how do decision makers considering military intervention assess risk, how does this process of risk-assessment vary between leaders and between states, and how is this process shaped and reshaped across time? How is the identification and measurement of risk influenced by the context of decision and problem framing; by culture; by personality, individual cognitive structure, the demands of ego preservation, and decision-making heuristics; by group dynamics and composition; and by organizational forces? Second, how can we explain variance in decision makers' willingness to accept, or reject, particular types of risks and to roll the dice on a military solution to foreign policy problems?

The paths to military intervention are both complex and

multiple, and Vertzberger eschews easy and simplistic answers to these questions. As he frankly notes, "the description and explanation of risk assessment and the formation of a risk-taking preference defy parsimony. . . . No single cause effectively explains either risk assessment or the formation of a risk-taking preference; instead, explanations require a broad socio-cognitive approach . . ." (p. 111).

This unembarrassed acknowledgement of complexity is simultaneously the volume's great strength and greatest liability. Vertzberger's emphasis on understanding the full range of influences that shape risk behavior is arguably warranted given the state of the field and casts exciting new light on a set of puzzling intervention decisions. This "everything matters" approach to explanation, though, necessarily limits the volume's contribution to the development of a parsimonious predictive model, one able to compete with the rational-choice models Vertzberger dismisses. This will frustrate those readers interested in applying sociocognitive insights to other decision problems. The step from explanation to prediction is critical if sociocognitive approaches like Vertzberger's are to improve the quality of decision making or to challenge rational-choice explanations of foreign policy. This step is not an impossible one. Indeed, one plausible reading of Vertzberger's analysis and evidence is that decision framing, cognitive belief structures, and simplifying heuristics have an extraordinary effect on risk behavior. Most interesting, although Vertzberger addresses recent work on prospect theory only briefly, the effect of decision framing emerges in high relief from this research—decision makers display a heightened willingness to gamble and decreased inclination to face up to the full scope of risks when they see themselves as acting to avoid loss.

In part, the volume's substantial length and intimidating heft are dictated by the complexity of the process being studied and by Vertzberger's wide-angle examination. In part, however, they also reflect Vertzberger's decision to combine what are essentially three logically distinct studies within a single cover.

The first, densest, and most exciting is an analytical exploration of the concept of risk and the sociocognitive factors influencing risk assessments and preferences. Vertzberger eschews classical microeconomic approaches to risk and regrounds the concept in common usage. He conceives of risk as a situation involving both the danger of an adverse outcome and informational uncertainty—about possible outcomes, the probability of those outcomes, or the validity of estimates of outcomes and probabilities. Decision makers vary in their attitude toward risk, both in their tolerance for risk and in their taste for different "textures" of risks—risks of similar magnitude but possessing different transparency, certainty, horizons, complexity, reversibility, controllability, and accountability. Risk attitudes, Vertzberger argues, must be regarded as created (and revised) through ongoing sociocognitive processes, not as given or fixed.

This approach to risk is intellectually liberating, opening new analytical doors by defining the term in a way that captures the essence of real-life decision processes and problems. At the same time, however, the imprecision of Vertzberger's definition raises significant difficulties, particularly since he remains interested in comparing the behavior of "risk averse" and "risk acceptant" decision makers. Given the multiple dimensions of risk implied by his definition and the absence of any advice on how to combine these dimensions in a single function, it is impossible to ascertain which of any two policies is objectively "riskier" and which a risk-averse decision maker would prefer.

The second portion of the book, coexisting in some ways

only uncomfortably with the first, is an examination of the factors that are likely to affect the success of military interventions and that should therefore be included in decision makers' risk assessments. That decision makers *should* pay attention to military capability, economic power, domestic and external political legitimacy, the nature of the target state, the effect of time on other variables, linkages between military and political outcomes, structural and nonstructural attributes of the international system, and possible responses by third parties when they gauge the risks of military intervention is reasonable enough. Given the logic of Vertzberger's sociocognitive conception of risk assessment and attitude-formation, however, it is much less clear that they *can*. As Vertzberger notes, decision makers are likely to overattend to the military balance and their appraisal of their own situation and to underweigh other risks.

The third component of the book is a focused comparison of decision making in five cases of military intervention—the Americans in Vietnam, Grenada, and Panama; the Israelis in Lebanon; and the Soviets in Czechoslovakia. Vertzberger's treatment is highly effective and the cases prove quite revealing, demonstrating the strikingly different paths leading decision makers to accept the risks of military intervention. His comparison of Grenada and Panama, for example, underscores how two presidents with dramatically different cognitive styles and initial risk preferences could approach risk-assessment and decision in very different ways but in the end both embrace military intervention. In two respects, however, case selection is arguably unfortunate. First, given Vertzberger's interest in advising foreign policy decision makers regarding the dangers and opportunities of military intervention, it is regrettable that he considers only cases from the Cold War. This limits Vertzberger's ability to address questions about the effect of globalization on the risks of intervention and the risk propensities of decision makers. Second, given Vertzberger's interest in exploring the factors that lead to risk acceptance, it is unfortunate that he has chosen not to examine cases in which military intervention was considered but rejected as too risky.

None of these complaints, however, should obscure Vertzberger's achievement and contribution. This volume should be regarded as mandatory reading for scholars grappling with the problem of explaining foreign policy decision making as well as for those wrestling with the issue of military intervention. Vertzberger's insights into the combined operation of sociocognitive influences on decision making under risk promise to spur and refocus theory-building efforts.

The Implementation and Effectiveness of International Environmental Commitments: Theory and Practice. Edited by David G. Victor, Kal Raustiala, and Eugene B. Skolnikoff. Cambridge: MIT Press, 1998. 737p. \$27.50.

Juliann Emmons Allison, *University of California, Riverside*

The process of implementing international agreements is a highly complex and not yet fully understood process. This is nowhere more true than in the area of environmental protection, which is plagued by scientific uncertainty and complicated by the increasing participation of subnational governments and nongovernmental actors. Yet, a better understanding of just how international agreements are put into practice is key to the negotiation of successful international environmental accords, such as those intended to protect rare and endangered species, reduce stratospheric ozone depletion, and regulate trade in hazardous materials. After 25 years and 170 multilateral environmental agree-

ments, what do we know about implementing such accords? In response to this question, the contributors to *The Implementation and Effectiveness of International Environmental Commitments* provide fourteen interrelated case studies evaluating the effectiveness of international environmental accords, or the degree to which nations' commitments are fulfilled. The product of a three-year research project conducted at the International Institute for Applied Systems Analysis, the volume is a welcome complement to prior research on international environmental cooperation focused primarily on the formation of international institutions and the negotiation of legally binding commitments.

The fourteen case studies assess implementation at both the international and domestic levels of analysis in eight substantive issue areas. International systems for implementation review (SIRs) are emphasized in three of these issue areas: the protection of flora and fauna, stratospheric ozone pollution, and trade in hazardous substances. John Lanchbery provides a competent examination of trends in the history of international efforts to collect and disseminate information on wildlife protection, and reports that there have been an increasing number of consistently improving SIRs concerned with the protection of flora and fauna. In the first of two chapters on the implementation of the Montreal Protocol on Substances that Deplete the Ozone Layer, Owen Greene describes in detail the mechanisms dedicated to implementing that accord, as well as the formal and informal activities of complementary institutions, such as the Technology and Economic Assessment Panel (TEAP), that have evolved over time. Greene's study suggests that the increased redundancy and access to data and review procedures associated with multiple, overlapping SIRs have improved the effectiveness of the ozone regime's implementation review process. David G. Victor's excellent analysis of the Montreal Protocol's provisions for managing noncompliance distinguishes between ad hoc and formal procedures for achieving signatories' compliance with not only the accord's regulatory commitments but also with its programmatic requirements, i.e., data reporting. Victor's finding that soft law, or discussion and diplomacy, has proved more effective and easier to implement than hard law, or sanctions, confirms the intuition of casual observers that compliance has been smoothest among nations that are motivated independently to implement the Montreal Protocol. Victor also provides a fine discussion of the prior informed consent (PIC) norm, which has evolved over the last decade to protect the mostly developing importers of hazardous chemicals and pesticides from potentially exploitative trade with their more industrialized exporters.

The domestic politics of implementing international environmental agreements is stressed in three other issue areas: pollution in the North Sea and Atlantic Ocean, commercial whaling, and the dumping of nuclear waste at sea. Jon Birger Skærseth's analysis of international efforts to reduce pollution in the North Sea and northeast Atlantic Ocean focuses on the institutional transition from targeting the reduction of dumping at sea to controlling pollution on land, which has required much greater domestic regulatory activity. According to Skærseth, the emergence of a balance between polluters and environmentalists within a given nation has contributed to the successful implementation of international standards for the quality of ocean waters. Steiner Andresen argues that a lack of restrictions on membership in the International Whaling Commission (IWC) effectively permitted environmental nongovernmental organizations (ENGOS) to pack the commission with nonwhaling nations in favor of a moratorium on whaling. He further explains how ENGOS,

particularly Greenpeace, also influenced national decisions to implement the IWC's preservationist policies. Olav Schram Stokke's study of the London Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter suggests that despite the accord's general failure, it nonetheless fostered the reduction of barriers to public participation in Soviet (and later Russian) decisions pertaining to nuclear waste disposal.

The remaining two issue areas—transboundary air pollution in Europe and the prevention of pollution in the Baltic Sea—include both chapters devoted to the functioning of SIRs and chapters focused on domestic implementation. With respect to transboundary air pollution, Juan Carlos di Primio provides a succinct description of the system for collecting and collating data on air pollution that preceded and continues to underlie the Convention on Long Range Transboundary Pollution's (LRTAP's) SIR. Jørgen Wettestad's complementary comparative study of the implementation of the LRTAP's nitrogen protocol in the Netherlands, the United Kingdom, and Norway suggests that the success of the LRTAP's SIR has coincided with the simultaneous decline in environmental and national ambitiousness with respect to reducing emissions of nitrogen oxides. His explanation for this coincidence is that the inherent difficulty of reducing nitrogen emissions has dampened interest in controlling this source of transboundary air pollution. Vladimir Kotov and Elena Nikitina's linked chapters on the implementation of the LRTAP's sulfur and nitrogen protocols in Russia suggest that the accord's success has been due largely to the Soviet Union's initial interpretation of transboundary air pollution control as a means of cooperating with the West, and centralized regulation of just the transboundary fluxes of sulfur dioxide and nitrogen oxides. According to Kotov and Nikitina, Russia's incomplete transition to a decentralized system of environmental regulation governed by market incentives for air pollution control has made it understandably much more difficult for that nation to continue implementing the LRTAP.

The volume's chapters on the implementation of the Convention on the Protection of the Marine Environment of the Baltic Sea (the Helsinki Convention) provide a provocative look at the role of public participation in the regulatory processes of democratic and democratizing nations. Contributors suggest that participation by environmentalists and the representatives of industries targeted by domestic regulations intended to reduce pollution of the Baltic Sea has mostly improved implementation of the Helsinki Convention in democratic nations; however, in democratizing nations, where environmentalism is weak and the administrative and financial resources necessary to regulate Baltic Sea pollution limited, public participation has arguably hindered it. Owen Greene's excellent description of the Baltic Sea regime's SIR suggests that despite the multiplicity of institutions and other parties dedicated to supporting its implementation, newly democratic members have found it administratively and fiscally difficult to comply with the Helsinki Convention's programmatic provisions, such as data collection and reporting. Alexei Roginko and Ronnie Hjorth both echo this concern in their accounts of Russian, Baltic, and Polish implementation of the Helsinki Convention, respectively. Originally interpreted as a security measure and means of establishing "green credentials," implementation by these nations was administered by the Soviet Union. The general lack of public concern for the environment and limited capacity of subnational governments to regulate environmental quality in these nations since the end of the Cold War support Roginko's and Hjorth's association of implementa-

tion with economic decline, rather than successful regulatory initiatives.

Analyses of the relationship between the political and economic transition of former Soviet nations and the implementation of international environmental agreements, such as the Helsinki Convention, support one of the volume's key conclusions. That is, eliciting international environmental commitments from democratizing and other nonliberal nations will likely require economic sanctions and other disincentives intended to alter their perception of the costs and benefits associated with international environmental cooperation. A greater reliance on nonbinding agreements is another possibility, considering some contributions, such as

Victor's discussion of the PIC norms, relate higher levels of cooperation and more stringent regulatory programs to these less formal instruments. Unfortunately, the volume's length and scope may discourage all but the most diligent and interested readers from appreciating these and other significant conclusions. A less descriptive and more balanced theoretical treatment of selected cases would make it far more accessible and useful to international relations and comparative scholars alike. *The Implementation and Effectiveness of International Environmental Commitments* would, nonetheless, make a nice addition to the library of anyone seriously interested in the practicalities of international environmental cooperation.

The Long Awaited Publication of
ERIC VOEGELIN'S
History of Political Ideas

SERIES EDITOR, ELLIS SANDOZ

VOLUME I

Hellenism, Rome, and Early Christianity

EDITED WITH AN INTRODUCTION BY ATHANASIOS MOULAKIS

Reaching from the decline of the Greek Polis to Saint Augustine, this first volume fills the gap left between volumes 3 and 4 of *Order and History*. The heart of the book is the powerful account of Apostolic Christianity's political implications and the work of the early church fathers. 296 pages, \$34.95.

VOLUME II

The Middle Ages to Aquinas

EDITED WITH AN INTRODUCTION BY PETER VON SIVERS

Voegelin's magisterial account of medieval political thought opens with a survey of the structure of the period and continues with an analysis of the Germanic invasions, the fall of Rome, and the rise of empire and monastic Christianity. 264 pages, \$34.95

VOLUME III

The Later Middle Ages

EDITED WITH AN INTRODUCTION BY DAVID WALSH

Voegelin continues his exploration of one of the most crucial periods in the history of political thought. Illuminating the great figures of the high Middle Ages, Voegelin traces the historical momentum of our modern world in the core evocative symbols that constituted medieval civilization. 296 pages, \$34.95

VOLUME IV

Renaissance and Reformation

EDITED WITH AN INTRODUCTION BY DAVID L. MORSE
 AND WILLIAM M. THOMPSON

By closely examining the sources, movements, and persons of the Renaissance and the Reformation, Voegelin reveals the roots of today's political ideologies in this fourth volume. This insightful study lays the groundwork for his critique of the modern period and is essential to an understanding of his later analysis. 320 pages, \$34.95

VOLUME V

Religion and the Rise of Modernity

EDITED WITH AN INTRODUCTION BY JAMES L. WISER

Examining the emergence of modernity within the philosophical and political debates of the sixteenth century, *Religion and the Rise of Modernity* resumes the analysis of the "great confusion" introduced in Volume IV of *History of Political Ideas*. 280 pages, \$34.95

VOLUME VI

Revolution and the New Science

EDITED WITH AN INTRODUCTION BY BARRY COOPER

Volume VI of Voegelin's account of the history of Western political ideas continues from the point reached in the previous volume with the study of the mystic-philosopher Jean Bodin. For the first time, the theoretical problem of the historicity of evocative symbols of political order becomes the focus of Voegelin's analysis. January, 248 pages, \$34.95

The American Experience

Daniel Patrick Moynihan

Introduction by Richard Gid Powers

"[A] withering account of the Government's bottomless appetite for 'intelligence'—that is, for collecting, concealing, suppressing, and manipulating it. It is a dismaying tale, though Moynihan has told it with uncommon liveliness and a mortant wit."—Sam Tanenhaus, *New York Times Book Review* 12 illus. \$22.50

The Collapse of the Soviet Military

William E. Odom

"A subtle, profound, and authoritative assessment of the life and sudden death of the Soviet military by the former director of the National Security Agency. . . . A careful, thoughtful, and outstanding contribution to the understanding of a tumultuous period."—*Kirkus Reviews* 17 illus. \$35.00

Never at War

Why Democracies Will Not Fight One Another

Spencer R. Weart

"A stimulating, impressive and important contribution. It has three particular virtues. First it is clearly written, and is thus fully accessible to an audience beyond the academy. Second, the scope of the inquiry is wide. . . . Third, [Weart] offers a refined version of the democratic peace hypothesis."—Michael Mandelbaum, *New York Times Book Review* \$35.00

The Bill of Rights

Creation and Reconstruction

Akhil Reed Amar

"Amar takes us on a historical odyssey. . . . [He] offer[s] a striking and original analysis of the political values embodied in the amendments. . . . In a rich clause-by-clause analysis, Amar elaborates his thesis. . . . Amar's stimulating republican interpretation restores the states and the people to their rightful place in the constitutional story."—James Henretta, *New York Times Book Review*

Perception and Prejudice

Race and Politics in the United States

Edited by Jon Hurwitz and Mark Peffley

"This book answers questions that have not been well answered in prior research and provides nuanced understandings of important areas of racial attitudes and beliefs."—James R. Kluegel 18 illus. \$30.00

On Democracy

Robert A. Dahl

In this accessible and authoritative book, an eminent political theorist provides a primer on democracy that clarifies what it is, why it is valuable, how it works, and what challenges it confronts in the future.

"This elegantly written handbook on democracy will be widely read. It is vintage Dahl."—Michael Walzer

THE SHADOW UNIVERSITY

The Betrayal of Liberty on
America's Campuses

**Alan Charles Kors and
Harvey A. Silverglate**

"Kors and Silverglate tell a chilling tale...they expose higher education's underbelly: the assault on liberty and true academic freedom (waged in the name of political correctness and group rights) that is occurring at so many of our nation's colleges and universities."

—Linda Chavez, President, Center for Equal Opportunity, and former Director, U.S. Commission on Civil Rights
1998 ISBN: 0-684-85321-3 \$25.00

BROTHER AGAINST BROTHER

Violence and Extremism in

1998 ISBN: 0-684-82760-3 \$25.00

CREATED UNEQUAL

The Crisis in American Pay
James K. Galbraith

"An eye-opener...provocative, important and readable. Policies tolerating high unemployment have fueled the huge growth in damaging wage inequality and its associated social and political maladies, Galbraith argues. Really full employment is key to a cure. Galbraith offers not just argument but a wealth of good evidence to support his case."

—Robert Eisner, author of *The Misunderstood Economy: What Counts and How to Count It*
1998 ISBN: 0-684-84988-7 \$26.00

SOMEONE ELSE'S HOUSE

America's Unfinished
Struggle for Integration

Tamar Jacoby

"The best documentation yet of how—after the '60s—a burgeoning black power came into sharp conflict with the very racial idealism that had opened the way for it to emerge. A penetrating work of social criticism; it is also the finest history of this period yet written."

—Shelby Steele, author of *The Content of Our Character: A New Vision of Race in America*
1998 ISBN: 0-684-80878-1 \$30.00

Social Politics in a Progressive Age

DANIEL T. RODGERS

This is the first major account of the vibrant international network that early reformers, progressives, and later New Dealers constructed and of its profound impact on the United States from the 1870s through 1945.

"A compelling narrative and a historical argument of great and lasting importance. It will be an enduring masterpiece."

Germany

A New History

HAGEN SCHULZE

Translated by Deborah Lucas Schneider

In one concise volume, Hagen Schulze brilliantly conveys the full sweep of German history through the events that have defined a nation at the center of European culture. This dramatic account of Germany's legacy, often overshadowed and distorted by the nation's recent past, offers a hopeful

answer to the perennial question of what kind of country it is and will be.

Germany's Second Chance

Trust, Justice, and Democratization

ANNE SA'ADAH

How does a country reconstitute itself as a functioning democracy after a period of dictatorship? Drawing on evidence from intellectual debates, trials, literary works, controversies about the actions of public figures, and partisan competition, Anne Sa'adah analyzes German responses to the problem of reconciliation after 1945 and again after 1989. She depicts the moral and political ambiguities and disappointment inherent to even successful processes of democratization.

What the People Know

Freedom and the Press

RICHARD REEVES

"Journalist Reeves...takes the high moral ground journalistically, arguing that after its spectacular successes reporting segregation, Vietnam, and Watergate, the press has become less of a watchdog and more willing to bare its fangs at politicians (who have become easy targets) while letting

up on corporate conglomerates (who increasingly own news-papers and broadcasting companies and are more likely to bite back with lawsuits). Meanwhile, the press gives us the soft stories that we apparently want. In this short, gracefully argued book, Reeves offers convincing reasons for this decline and a plea for journalism to return to its roots."

Reinventing Russia

Russian Nationalism and the Soviet State, 1953–1991

YITZHAK M. BRUDNY

Brudny argues that the rise of the Russian nationalist movement was a combined result of the reinvention of Russian national identity by a group of intellectuals, and the Communist Party's active support of this reinvention in order to gain greater political legitimacy. He meticulously reconstructs both the development of Russian nationalist thought from Khrushchev to Yeltsin, and the Communist Party response to Russian nationalist ideas.

A Prehistory of the American Welfare System

MATTHEW A. CRENSON

This book examines the connection between the decline of the orphanage and the rise of welfare in America. Matthew Crenson argues that the prehistory of the welfare system was played out not on the stage of national politics or class conflict but in the micropolitics of institutional management.

China

A New History
Enlarged Edition

**JOHN KING FAIRBANK
AND MERLE GOLDMAN**

The late John King Fairbank was the West's doyen on China, and this book is the full and final expression of his lifelong engagement with this vast ancient civilization. This book remains a masterpiece without parallel—a concise and authoritative account of China and its people over four millennia.

The distinguished historian Merle Goldman has brought the book up to date with a chapter on events in the post-Mao period and a new preface and epilogue.

"*China: A New History* sets out to cover...the entire span of China's history...and it does so with a brisk and sprightly air but also with an awesomely thorough overview of the current scholarly work of scores of historians."

Asian Values and Human Rights

A Confucian Communitarian Perspective

WM. THEODORE DE BARY

In this provocative book, one of our most learned scholars of China moves beyond the political shouting match surrounding human rights in China by contextualizing this debate from a Confucian and a historical perspective. He highlights the philosophical development of Confucianism as well as the

Chinese historical experience with community organization, constitutionalism, education, and women's rights.

"Wm. Theodore de Bary combines linguistic clarity with historical scholarship. While disputing the politicians' appropriation of 'values,' he emphasizes the importance of community and communitarianism...An informative and provocative book."

The Grabbing Hand

Government Pathologies and Their Cures

**ANDREI SHLEIFER AND
ROBERT VISHNY**

In many countries, public sector institutions impose heavy burdens on economic life: heavy and arbitrary taxes retard investment, regulations enrich corrupt bureaucrats, state firms consume national wealth, and the most talented people turn to rent-seeking rather than productive activities. As a consequence of such predatory policies—described in this book as the grabbing hand of the state—entrepreneurship lingers and economies stagnate. The authors of this collection of essays describe many of these pathologies and examine their consequences for growth in medieval Europe, developing countries, transition economies, and in the current U.S. economy.

Introductory Econometrics

ARTHUR S. GOLDBERGER

This is a textbook for the standard undergraduate econometrics course. The structure is similar to that of Goldberger's graduate-level textbook, *A Course in Econometrics*, but this new book is richer in empirical material, makes no use of matrix algebra, and is primarily discursive in style. Goldberger pro-

vides many theoretical and empirical exercises and, on an accompanying diskette, offers real micro-and macro-economic data sets.

Loose Connections

Joining Together in America's
Fragmented Communities

ROBERT WUTHNOW

Acknowledging that there has been a significant change in group affiliations—away from traditional civic organizations—Robert Wuthnow shows that many Americans are finding new and innovative ways to help one another through short-term task-oriented networks. These more fluid groups are better suited to dealing with today's needs than the fraternal orders and ladies' auxiliaries of the past. Wuthnow looks at the challenges that must be faced if these innovative forms of civic involvement are to flourish.

"A highly readable and extremely convincing account of why the strategies adopted by east European governments have failed. [The authors] argue that these governments adopted a free-market, neo-classical model of capitalist development, totally inappropriate to their condition and history, and

one which did not reflect the way advanced capitalist countries had themselves developed."

**ABRAM CHAYES AND
ANTONIA HANDLER CHAYES**

"A readable synthesis of international law and political science, *The New Sovereignty* is a valiant and coordinated attempt to answer Kenneth Oye's question: 'If international relations can approximate both a Hobbesian state of nature and Lockean...society, why does cooperation emerge in some cases

and not in others?'...One of the many strengths of this book is an analytical style that is at once legalistic and political. Such an approach is clearly an attempt to bridge the gap between international relations scholars and international lawyers, as well as between theoreticians and policymakers. The authors' understanding is as broad as it is deep."

Governing the Socialist Metropolis

TIMOTHY J. COLTON

Moscow is for many the quintessence of everything Russian. Timothy Colton's sweeping biography of this city at the center of Soviet and post-Soviet life reveals what such a position has meant to Moscow and ultimately to Russia itself.

"A sprawling, affectionate history of who governed the socialist metropolis, and how they did...Timothy J. Colton has given us a blueprint for reading the contemporary capital, superbly demonstrating the depth of the Soviet-era contribution to the ancient city's outer face and inner structure."

AMERICA'S INTERNATIONAL RELATIONS SINCE WORLD WAR I

Wesley M. Bagby, *West Virginia University*

Based on the latest scholarship and newly discovered foreign documents, this text offers a thorough account of American diplomatic history in the 20th century, including coverage of important subjects usually omitted from other texts, such as economic issues and internal development in Russia, the Soviet Union, and China. Within the chronological framework, each chapter presents key foreign relations problems addressed by a particular presidential administration.

FREEDOM AND THE COURT

Civil Rights and Liberties in the United States

Seventh Edition

Henry J. Abraham, *University of Virginia*, and Barbara A. Perry, *Sweet Briar College*

"The most highly readable, unbiased, well-informed work on civil rights and liberties in the United States. I would highly recommend it."—Mark Hall, *East Central University* (on the previous edition)

This classic study remains the best and most comprehensive textual summary of the Supreme Courts work on civil liberties and civil rights up through October of 1997. Lucid, lively, impeccably researched, and enormously readable, it is indispensable to the teaching of civil liberties and the Supreme Court.

THE JUDICIAL PROCESS

An Introductory Analysis of the Courts of the United States, England, and France

Seventh Edition

Henry J. Abraham, *University of Virginia*

"A classic on comparative judicial systems! Friendly to the first-time reader, always rich with information for the specialized scholar."—Francesco Parisi, *George Mason University*

The new seventh edition brings this work completely up to date through the end of 1997. It includes judicial appointments during the Bush and Clinton administrations; significant alterations in the structure and organization of the United States, British, French, and other European courts; and the collateral developments on the frontiers of judicial review procedures as well as the judicial role.

THE U.S. PRESIDENCY IN CRISIS

A Comparative Perspective

Colin Campbell, *Georgetown University*

This text sheds light on the U.S. presidency through a comparative study of executive leadership in the United States, Great Britain, Canada, and Australia. It focuses on the common challenges faced by chief executives of other Anglo-American democracies, offering a unique and rich context for examining the U.S. presidency.

WOMEN AND ELECTIVE OFFICE

Past, Present, and Future

Edited by Sue Thomas and Clyde Wilcox, both at *Georgetown University*

Women and Elective Office picks up where other books on women in politics leave off. It synthesizes previous research on women candidates and officeholders in the United States, and offers original data and analysis on the current situation of women in the political elite. The introduction provides an historical glimpse of women's success at breaking electoral barriers and the reasons why it is important for women to run for and win office. There is also a chapter on minority women officeholders, a topic that has, to date, been under-examined.

THE RUSSIAN EMPIRE AND THE WORLD, 1700-1917

The Geopolitics of Expansion and Containment

John P. LeDonne, *Harvard University*

This text postulates the existence of a permanent geopolitical framework called the Heartland within which a Russian core area fought for hegemony. The text brings together various strands of Russian foreign policy before 1917, showing the consistency and importance of the policy's purpose and methods. It draws valuable lessons to help readers understand Soviet foreign policy and the renewed pressures Russia faces to restore its position within the Heartland.

ANNOUNCING AN IMPORTANT NEW SERIES FROM
OXFORD UNIVERSITY PRESS

The Religion and Global Politics Series

General Editor:
John L. Esposito,
Georgetown University

About the General Editor

John L. Esposito is Professor of Religion and International Affairs at Georgetown University, where he is also Director of the Center for Muslim-Christian Understanding: History and International Affairs. A former President of the Middle East Studies Association, he has written and edited several books and articles.

At the dawn of the twenty-first century, the worldwide resurgence of religious beliefs and practices is pervasive. Especially visible is the widespread influence of politicized religion or "religious fundamentalism" upon international affairs. A reversal of what many saw as an inexorable process of both modernization and secularization across the globe now poses major challenges for anyone attempting to understand or respond to the realities of international politics.

Oxford's new **Religion and Global Politics Series** is a cutting-edge effort to address these challenges by publishing scholarship on the ever-changing relationship between religion and world affairs. The series will counter the popular, yet erroneous, equation of development with secularization and westernization while questioning the false assumptions underlying the frequent opposition of tradition and modernity, religion and progress, and faith and reason.

The Religion and Global Politics Series seeks bridges rather than borders; it will fully explore the dynamism, complexity, and variety of religion in the modern world.

Mistaken Identity

The Supreme Court and the Politics of Minority Representation

Keith J. Bybee

Is it ever legitimate to redraw electoral districts on the basis of race? The U.S. Supreme Court has treated race-conscious redistricting either as a requirement of political fairness or as an exercise in corrosive racial quotas. Cutting through these contradictory positions, Keith Bybee examines the theoretical foundations of the Court's decisions and the ideological controversy those decisions have engendered. He uncovers erroneous assumptions about political identity on both sides of the debate and formulates new terms on which minority representation can be pursued.

"Throughout this book, Keith Bybee presents a fine balance of historical, legal, and political philosophical argument. He knows what he is doing in each genre; this is an impressive display of scholarly mastery."

Forged Consensus

Science, Technology, and Economic Policy in the United States, 1921-1953

David M. Hart

In this thought-provoking book, David Hart challenges the creation myth of post-World War II federal science and technology policy. According to this myth, the postwar policy sprang full-blown from the mind of Vannevar Bush in the form of *Science, the Endless Frontier* (1945). Hart puts Bush's efforts in a larger historical and political context, demonstrating in the process that Bush was but one of many contributors to this complex policy.

Hart places these policy entrepreneurs in the broad scheme of American political development, and shows that policymakers today are still grappling with the legacies of the forged consensus.

Does Conquest Pay?

The Exploitation of Occupied Industrial Societies

Peter Liberman

Can foreign invaders successfully exploit industrial economies? The resurgence of nationalism has led many policymakers and scholars to doubt that conquest still pays. Cultural Realism

Strategic Culture and Grand Strategy in Chinese History

Alastair Iain Johnston

Cultural Realism is an in-depth study of premodern Chinese strategic thought that has important implications for contemporary international relations theory. Its findings challenge dominant interpretations of traditional Chinese strategic thought.

"Johnston is correct that many actual Chinese uses of force look far more like 'realism' than many Sinologists have realized. His stress on the 'realist' thread in the classics is likewise very illuminating."

Wayne D. Moore

In a book that will radically reorient thinking about the Constitution, Wayne Moore moves away from an exclusive focus on courts and judges and examines a number of questions: Who is included among the "people"? How are the people politically configured? How may the people act? And how do the people relate to government? In answering these questions, Moore offers new insights into central problems of constitutional history, theory, and law.

"The entire package within which these familiar positions take shape is often refreshingly original. . . . There is much in Moore's work that merits attention from constitutional theorists."

THE SHAPE OF THE RIVER

Long-Term Consequences of Considering Race in College and University Admissions

**William G. Bowen
and Derek Bok**

"No study of this magnitude has been attempted before. . . . The evidence collected flatly refutes many of the misimpressions of affirmative-action opponents."—*The New York Times*

Californians have voted to abolish it. Almost all leading colleges and professional schools strongly support it. Across the United States, in courts, classrooms, and the media, Americans are divided over the use of race in admitting students to universities. Yet until now the debate has been mainly one of clashing opinions, uninformed by hard evidence.

This book is intended to change that. It brings a wealth of factual evidence to bear on how race-sensitive admissions policies actually work and what effects they have had on students of different races. Its conclusions will mark a watershed in national discussions of affirmative action and race relations in general.

FAITHFUL AND FEARLESS

Moving Feminist Protest inside the Church and Military

Mary Fainsod Katzenstein

Women in uniform are deeply patriotic and women active in the church are devoted to their callings. Yet Mary Fainsod Katzenstein shows that these women often feel isolated and demeaned. Although faithful to their institutions, many have proved fearless in their attempts to reshape them.

Drawing on interviews with over 100 women—including senior officers, combat pilots, lay activists, and nuns—this book gives voice to the struggles and vision of these women.

VOICE, TRUST, AND MEMORY

Marginalized Groups and the Failings of Liberal Representation

Melissa S. Williams

Does fair political representation for historically disadvantaged groups require their presence in legislative bodies? Melissa Williams maintains that fair representation is powerfully affected by the identity of legislators and whether they are actually members of the historically marginalized groups that are most in need of protection in our society.

"*Voice, Trust, and Memory* is a unique and important contribution to literature in contemporary political theory on questions of justice toward historically excluded groups."

ANALYTIC NARRATIVES

**Robert H. Bates, Avner Greif,
Margaret Levi,
Jean-Laurent Rosenthal,
and Barry R. Weingast**

Students of comparative politics have long faced a vexing dilemma: how can social scientists draw broad, applicable principles of political order from specific historical examples? In *Analytic Narratives*, five senior scholars offer a new and ambitious methodological response to this important question.

By employing rational-choice and game theory, the authors propose a way of extracting empirically testable, general hypotheses from particular cases. The result is both a methodological manifesto and an applied handbook that political scientists will find essential.

POISONING THE MINDS OF THE LOWER ORDERS

Don Herzog

Conservatism was born as an anguished attack on democracy. So argues Don Herzog in this arrestingly detailed exploration of England's responses to the French Revolution. He addresses questions that resonate with meaning today. How were England's humble subjects transformed into proud citizens? And just how successful was the transformation?

At once absorbing and disquieting, *Poisoning the Minds of the Lower Orders* challenges our own commitments to and anxieties about democracy.

Security Communities

Emanuel Adler and Michael Barnett, Editors

This book argues that community can exist at the international level, and that states dwelling within an international community have the capacity to develop a pacific disposition. The contributors provide an exhaustive regional and historical survey of places where states have come to expect peace, where they are working to foster such expectations, and where peace is hoped for rather than expected.

Adam Smith and the Virtues of Enlightenment

Charles L. Griswold, Jr.

This book is the first comprehensive philosophical study of Adam Smith's moral and political thought. Griswold sets Smith's work in the context of the continuing debate about the nature and survival of the Enlightenment, and relates it to current discussions in moral and political philosophy. Smith's appropriation as well as criticism of ancient philosophy, and his carefully balanced defense of a liberal and humane moral and political outlook, are also explored.

Votes without Leverage

Women in American Electoral Politics, 1920-1970

Anna L. Harvey

Using recent theoretical developments in the political economy of institutions and electoral behavior, this book attempts to solve an enduring puzzle in women's electoral politics, namely why the increasing importance of women's votes in the 1920s did not imply increasing success for the lobbying efforts of women's organizations. The book argues that women's exclusion from the suffrage created terms that led to distinctive patterns of post-suffrage female electoral politics. These electoral dynamics in turn are responsible for the decline in the political influence of women's organizations by the mid-1920s.

An Essay on the Modern State

Christopher W. Morris

This important book is the first serious philosophical examination of the modern state. It inquires into the justification of this particular form of political society. It asks whether all states are "nation-states," what are the alternative ways of organizing society, and which conditions make a state legitimate. The author concludes that, while states can be legitimate, they typically fail to have the powers (e.g. sovereignty) that they claim.

Tokugawa Political Writings

Tetsuo Najita, Editor

The modern political consciousness of Japan cannot be understood without reference to the history of the Tokugawa period, the era between 1600 and 1868 that preceded Japan's modern transformation. In this volume Najita introduces the ideas of the leading political thinker of the period, Ogyu Sorai (1666-1728), providing an important insight into the history and politics of contemporary Japan. Sorai's texts are accompanied by a chronology of his life, a glossary, a guide to persons mentioned in the text, and a guide to further reading.

Recreating Europe

The European Union's Policy towards Central and Eastern Europe

Alan Mayhew

The enlargement of the European Union to include central and eastern Europe is the greatest challenge Europe will face in the next decade. In this book a former leading European Commission official considers both the current relationship between EU and central Europe, and the main problems to be faced on the road to enlargement, including reform of agricultural policy, regional policy, the budget and migration. The book analyzes the costs and benefits of enlargement and concludes that it is not only necessary, but will bring major gains to the whole continent.

— Cornel West

This eagerly awaited book complements two highly successful previously published volumes of Richard Rorty's philosophical papers: *Objectivity, Relativism, and Truth*, and *Essays on Heidegger and Others*. In this new, provocative collection, Rorty continues to defend a pragmatist view of truth and deny that truth is a goal of inquiry. In these dynamic essays, Rorty also engages with the work of many of today's most innovative thinkers including Robert Brandom, Donald Davidson, Daniel Dennett, Jacques Derrida, Jürgen Habermas, John McDowell, Hilary Putnam, John Searle, and Charles Taylor.

Problem Representation in Foreign Policy Decision Making

Donald A. Sylvan and

James F. Voss, Editors

Previous studies of foreign policy decision making have largely focused on the choice among specified options rather than the prior question of how the options were specified in the first place. Such "problem representation" is the focus of this volume. How do the game theorists' options and utilities come about? The editors contend the representation of the problem to which the options are a response, the determinants of that representation, and its ramifications must all be analyzed.

Competitive Governments

An Economic Theory of Politics and Public Finance

Albert Breton

Competitive Governments systematically explores the hypothesis that governments are internally competitive, that they are competitive in their relations with each other and in their relations with other institutions in society that, like them, supply consuming households with goods and services. Breton contends that competition not only serves to bring the political system to an equilibrium, but it also leads to a revelation of the households' true demand functions for publicly provided goods and services and to the molding of a link between the quantities and the qualities demanded and supplied and the tax prices paid for these goods and services.

Term Limits and Legislative Representation

John M. Carey

"...a wonderful example of the value of comparative political analysis...."

—American Political Science Review

Legislative term limits are the most important electoral reform on the political agenda in the United States. *Term Limits and Legislative Representation* tests the central arguments made by both supporters and opponents of the reform by examining the experience of Costa Rica, the only long-term democracy to impose term limits on legislators, and by providing extensive comparisons with legislatures in Venezuela and the United States.

Social Welfare and Individual Responsibility

David Schmidt and Robert E. Goodin

The issue of social welfare and individual responsibility has become a topic of international public debate in recent years as politicians around the world now question the legitimacy of state-funded welfare programs. Schmidt and Goodin debate the ethical merits of individual versus collective responsibility for welfare. Schmidt argues that social welfare policy should prepare people for responsible adulthood rather than try to make that unnecessary. Goodin argues against the individualization of welfare policy and expounds the virtues of collective responsibility.

Democracy, Development, and the Countryside

Urban-Rural Struggles in India

Ashutosh Varshney

What happens to the rural folk—to their power and economic well-being—when development takes place in a democratic framework? Focusing on India where, unlike most of the developing world, a democratic system has flourished for four decades, this book investigates how the rural sector uses its numbers in a democracy to further its economic and political interests. The book also argues that identities constitute a powerful constraint on the pursuit of economic interests.

The Pursuit of Absolute Integrity

How Corruption Control Makes Government Ineffective

Frank Anechiarico and James B. Jacobs

"No one much likes corruption, and calls for reform are politically popular. But the cures can be worse than the problem itself; at the very least, reformers ought to be aware of the difficulties they can create as they pursue the impossible goal of totally honest government. Frank Anechiarico and James Jacobs make these points effectively in this book, a timely and very useful addition to the new debate over corruption and reform."—Michael Johnston, *American Political Science Review*

A Question of Loyalty

Military Manpower Policy in Multiethnic States

ALON PELED

States that use military conscription and whose ethnic minorities have relatives in hostile countries face a dilemma: the state demands military service from the minorities, but mistrusts their loyalty. Alon Peled compares the experiences of soldiers in Singapore, Israel, and South Africa. Drawing on his interviews with senior officers and policymakers, he examines the histories of these armies, and suggests solutions to ethnic integration. THE DIRECTORY OF WOMEN OF COLOR IN POLITICAL SCIENCE

A joint project between the Women's Caucus for Political Science and APSA's Committee on the Status of Women in the Profession, the directory was designed to assist graduate students in their search for mentors. Nearly 300 APSA members are included in the directory, with their addresses, telephone, e-mail and fax numbers. Each listing includes the member's current position, institution and date of highest academic degree, as well as fields and subfields of specialization and membership in Organized Sections.

THE FUTURE OF AMERICAN PROGRESSIVISM

AN INITIATIVE FOR POLITICAL AND ECONOMIC REFORM

"[A] call for democratizing the market economy and energizing representative democracy by unleashing the creative abilities of Americans. . . . **A BOLD POLITICAL ANALYSIS.**"

—Kirkus Reviews

Roberto Mangabeira Unger, widely regarded as the creator of "the most powerful social theory of the second half of the century" (Geoffrey Hawthorn), and Cornel West, "the preeminent African-American intellectual of our generation" (Henry Louis Gates, Jr.), argue that **WE MUST REINVENT OUR PUBLIC INSTITUTIONS**. Their program is an image of political and civic life as an evolving and hopeful arena for solving our collective problems.

50% Off Hotel Rates

An Incredible Offer For American Political Science Association Members!

**YOU CAN SAVE
UP TO
\$200
ON AIRFARE**
...limited time offer
CALL NOW!!!

I imagine saving a full 50% at a huge selection of terrific hotels!

How? Join *Quest International*. And right now you can join Quest at tremendous savings!

A Quest Membership normally sells for \$99.00. But through a special agreement with Destinations, Inc. (group distributors for Quest), you'll get in at a fraction of the retail cost. **Just \$29.95!**

"WHERE CAN I STAY? WHICH HOTELS?"

You'll find locations from virtually every major chain—plus terrific resort facilities. Your 100-page, full color Quest Hotel Directory has all the details. Plus, you get a brand-new, fully-updated directory three times a year—at no extra cost!

50% OFF... ARE THEY CRAZY?

Why do hotels do it? — Simple. — Profits.

You see...on average, annual hotel occupancies are around 65%. But remember that 65% full also means 35% empty. And once a hotel meets its break-even point, any additional room sold is pure profit for the hotel. Even when you pay just half the regular rate.

Occasionally a hotel fills completely, like during a

convention or special event. If they expect to fill they may decline a half-price reservation. But, the rest of the time, they'd love to have you stay.

TRY QUEST ALL YEAR—RISK FREE!

Take Quest on the family vacation. Use it on your next business trip. What about a weekend getaway? Use your Quest membership all year long!

Your satisfaction is completely guaranteed! If you're not fully pleased with your Quest membership—you get your money back!

25% OFF HOTEL DINING

Cut 25% off your total food bill! Check your hotel directory for participating restaurants and enjoy the savings. *Bon Appetit!*

Nixon's Vietnam War

Jeffrey Kimball

"A convincing, devastating deconstruction of Richard Nixon's and Henry Kissinger's Vietnam War policies. Kimball puts their Vietnam War maneuverings under a microscope and discovers a malignant cancer on the presidency." ~ *KIRKUS REVIEWS*. "An enormously impressive work that lays bare the real Nixon and, along the way, reduces his version of the war to a legend of his own making." ~ STANLEY KUTLER, author of *Abuse of Power*. Congressional Populism and the Crisis of the 1890s

Gene Clanton

"Clanton is exceptionally well qualified to write the first serious history of the 1890s Populists—the real Populists—in Congress. He also tells the truth: that what's often called 'populism' these days is 180 degrees to the right of the real thing." ~ WALTER NUGENT, author of *Tolerant Populists*.

The Latest Comprehensive Reference to Political Science Graduate Programs and Faculty

The new edition of **Graduate Faculty and Programs in Political Science 1998-2000**, the APSA's valuable resource for students, faculty and college counselors, is available in Spring 1998.

Over 400 programs are described in the directory. Graduate Programs in Britain are included for the first time along with the comprehensive listing of programs in the United States and Canada.

The entries for Ph.D. and Masters programs in political science and the associated fields of public administration, public policy and international affairs include information about the type of degree(s) awarded, tuition charges, financial aid and admission and degree requirements. Faculty for the program are listed with their major fields of specialization, degrees, telephone numbers and e-mail addresses.

The directory also has an appendix with data on the number of students in each program, the ratio of student applications to admissions and the numbers of degrees awarded along with affirmative action information. Use of the directory is facilitated by an alphabetical index of faculty and a geographical index of institutions.

Departments that are members of the Departmental Services Program may submit purchase orders.

SHOULD WE STOP IMPEACHMENT? IS IMPEACHMENT BEING USED AS A RED HERRING? SHOULD WE PRAISE CLINTON FOR ALLUDING TO THE TRUTH ABOUT THE SURPLUS AND SOCIAL SECURITY?

In September 1996, every member of Congress was given a manuscript version of "Operation Prosperity." Two prominent Senators replied with:

"You make many important observations regarding the Federal Budget, entitlement spending, tax reform, and other governmental reforms.... I will be certain to keep your ideas and suggestions in mind as any relevant legislation comes before the Senate for a Congressional vote."

—California Senator Dianne Feinstein (Democrat)

"I appreciated the opportunity to read your ideas on how to make America a better place... I agree with you about the seriousness of the budget deficit... I will keep your ideas in mind as Congress acts on these matters."

—Utah Senator Orrin G. Hatch (Republican)
